# Preface

In April 2013 I published **“Our American Pravda,”** a major article highlighting some of the most disturbing omissions of our national media in issues of the greatest national importance. The considerable attention it attracted from ***The Atlantic***, ***Forbes***, and **a *New York Times* economics columnist** demonstrated that the mainstream journalists themselves were often all too aware of these problems, but perhaps found them difficult to address within the confining structure of large media organizations. This reinforced my belief in the reality of the serious condition I had diagnosed.

As I wrote at the time:

> The realization that the world is often quite different from what is presented in our leading newspapers and magazines is not an easy conclusion for most educated Americans to accept, or at least that was true in my own case. For decades, I have closely read the *New York Times*, the *Wall Street Journal*, and one or two other major newspapers every morning, supplemented by a wide variety of weekly or monthly opinion magazines. Their biases in certain areas had always been apparent to me. But I felt confident that by comparing and contrasting the claims of these different publications and applying some common sense, I could obtain a reasonably accurate version of reality. I was mistaken.
>
> Aside from the evidence of our own senses, almost everything we know about the past or the news of today comes from bits of ink on paper or colored pixels on a screen, and fortunately over the last decade or two the growth of the Internet has vastly widened the range of information available to us in that latter category. Even if the overwhelming majority of the unorthodox claims provided by such non-traditional web-based sources is incorrect, at least there now exists the possibility of extracting vital nuggets of truth from vast mountains of falsehood. Certainly the events of the past dozen years have forced me to completely recalibrate my own reality-detection apparatus.

In a related article, I later added:

> We naively tend to assume that our media accurately reflects the events of our world and its history, but instead what we all too often see are only the tremendously distorted images of a circus

> fun-house mirror, with small items sometimes transformed into large ones, and large ones into small. The contours of historical reality may be warped into almost unrecognizable shapes, with some important elements completely disappearing from the record and others appearing out of nowhere. I've often suggested that the media creates our reality, but given such glaring omissions and distortions, the reality produced is often largely fictional.

Whether misleading or not, the stories in our newspapers and magazines tend to be transitory, but the passage of time may gradually congeal such contemporaneous media propaganda into the standard historical narratives that almost all of us have been taught represents the accurate account of the past. The falsehoods of today can easily become permanent ones.

This obvious relationship between media and history led me to eventually expand what had been a single article into a very lengthy series, exploring such histories and attempting to determine the reality of what had happened. These dozens of articles carefully analyzed many of the most momentous events of the twentieth century.

A couple of years ago, I had closed another article with the following sentence:

> I've also sometimes joked with my friends that when the true history of our last one hundred years is finally written and told—probably by a Chinese professor at a Chinese university—none of the students in his lecture hall will ever believe a word of it.

Taken together this collection seeks to provide a historical counter-narrative of our last one hundred years.

# The Life and Legacy of Lt. Gen. William Odom

*While other top brass played press agents for the administration's war, William Odom told the truth about Iraq—though few listened.*

GENERAL PRINCIPLES
The Life and Legacy of Lt. Gen. William Odom

Much as the capital loves ceremony, Washington won't pause on Sept. 8 when Lt. Gen. William Odom is laid to rest at Arlington Cemetery. While he is worthy of his laurels, he did not court the favor of the Beltway political class. Instead, he disdained their blindness to history, their partisan fixations, their herd mentality. Brave men often stand alone.

Those with knowledge of military affairs recognize different types of courage. There is combat courage—the resolve to storm a position or hold a trench against heavy odds. There is command courage—the willingness of officers to take decisive action and sustain losses to secure victory. And there is a third variety, crucial at the topmost ranks of America's officer corps but increasingly rare—political courage, the willingness to speak truth to political power. Bill Odom, whom I greatly admired and respected, exemplified this last, most elusive kind of courage, which is why his death of a heart attack on

May 30 leaves such a void in America's foreign-policy debate.

He passed away too soon, but in some ways Odom had already lived past his time, the era of Cold War liberal internationalism. After graduating from West Point in 1954, he served in Germany and Vietnam and was later posted to the Moscow embassy. Following several years of teaching at West Point, he came to Washington as an aide to Zbigniew Brzezinski, President Carter's national security adviser. There, he gained a reputation as "Zbig's superhawk" for his staunch opposition to détente and his prescient speculations about the possible break-up of the Soviet Union before the end of the century. He went on to serve as assistant chief of staff of the Army for Intelligence and director of the National Security Agency under President Reagan.

In the wake of Sept. 11, this retired three-star general, long a pillar of the foreign-policy establishment, seemed uniquely qualified to be heard. Indeed, he was one of the earliest senior military figures to issue public warnings as the hysterical drive to invade Iraq eventually became a calamitous occupation, an outcome that he later described as "the greatest strategic disaster in U.S. history."

But since Odom first arrived in D.C.—and especially after the fall of the Soviet Union—the town has become more and more an Imperial City, whose Imperial Court rules a global empire, albeit an increasingly beleaguered and bankrupt one. Competence is far less important to advancement than glibness, media intrigue, and the flattery of wealthy patrons. Sober views of military and geopolitical limits have little place in an administration whose courtiers deride their opponents as members of the "reality-based community." Therefore, after 9/11, America's most prestigious newspapers—the *New York Times, Washington Post,* and *Wall Street Journal*—virtually closed their pages to Odom's discordant views.

Reduced to publishing on small websites like NiemanWatchdog.org, he refused to blunt his critique. Odom's web columns had titles like "Six brutal truths about Iraq," "Iraq through the prism of Vietnam," and "What's wrong with cutting and running?" Other national columnists said similar things —if more cautiously—but most were liberal pundits with negligible military credentials. Odom had served as one of Ronald Reagan's highest-ranking national security officials, and his words should have carried enormous weight.

Yet who did the mainstream media select to inform the American public? An endless stream of youthful neocons, almost none of whom

had ever worn an American uniform, but who had instead chosen to make their careers in the gilded cocoon of conservative think tanks and punditry. Ironically, some of the loudest might have had their closest encounter with military service when they took Odom's courses in strategy at Yale, though they obviously learned nothing.

There lies another telling contrast. Odom was a career military man. His ancestor Col. George Waller had served with George Washington at Yorktown; two of his great-grandfathers fought for the Confederacy. His only son, Mark, led dangerous field operations in Iraq before being injured last year in an insurgent bombing. Odom was also a serious scholar, with a Columbia Ph.D. in political science, a long list of academic books and journal articles, and an adjunct professorship at Yale.

But to the editors of the major dailies, the proper experts were neocon wordmongers, whose only books were shallow diatribes on subjects ranging from abortion to tax policy to defense, all written with equally zestful ignorance. They knew little about the Mideast or the military, but held advanced degrees in networking, doctorates in self-promotion, and had paid their dues by courting every editor on the cocktail-party circuit. After all, if reality doesn't exist, why not hire your friends to analyze it?

Yet with America at war, pasty-faced, 30-something Heritage alumni writing endless newspaper columns on grand strategy—and gay marriage—would inspire no confidence on television. The public needed to see high-ranking veterans, solemn and stern-faced, validating the actions of the Bush administration.

That's exactly what they got. From the moment the planes hit the World Trade Center, the networks, and the cable news channels in particular, developed an insatiable hunger for military commentators, graying former generals heavy on brass and ribbons. Their judgments could not easily be dismissed, given their professional expertise and lifetimes of service, and almost invariably, they supported the views of the White House. The public trusted them and followed where they led—into Afghanistan and then Iraq.

We discovered how much their credibility was worth on April 20, when the *New York Times*—at long last—published an exposé, based on 8,000 pages of Pentagon e-mail and transcripts, about the business activities and financial ties of these supposedly dispassionate experts. CNN paid them as much as $1,000 per appearance, but most were simultaneously receiving vastly greater sums from their military

procurement and government contracting work. For example, Gen. James Marks appeared regularly on cable news throughout 2006, even as he was involved in bidding, through his work with McNeil Technologies, for a $4.6 billion contract to provide translators in Iraq.

One might crudely say that the government owned 99 percent of these men while the news channels rented 1 percent—and then asked them their opinion of the government. Their financial futures were in the hands of the administration officials they were evaluating on television.

The White House played this relationship to full advantage. Bush officials routinely organized briefings to provide inside information to these pundits and to tailor their commentary. The *New York Times* uncovered Pentagon documents describing the talking-head generals as "message force multipliers" or "surrogates," who could be counted on to propagate the administration's message "in the form of their opinions." The Pentagon even hired Omnitec Solutions, a consulting company, to watch the television appearances and grade the performances of these purportedly neutral commentators. The reviews were then passed on to Bush appointees at the Pentagon who controlled the flow of procurement funding.

There are documented examples of retired generals believing that the situation in Iraq was an absolute disaster, but providing only the requested Happy News to millions of Americans seeking their wisdom on television. After returning from a government-sponsored trip to Iraq, Gen. Paul E. Vallely, a Fox News analyst, told Alan Colmes, "You can't believe the progress," predicting that the insurgency would be reduced "to a few numbers" within months. But he later told the *New York Times*, "I saw immediately that things were going south in 2003."

Many of these former high-ranking American military officers should have every right to request membership in the Screen Actors Guild, and in some cases their theatrical pay might place them near the upper end of the Hollywood wage scale. There is a particular word for military officers who trade away their own country's national security interests for large financial payments, and it is not a pleasant one.

Bill Odom instead held to the code of traditional military honor. He had not entered the Armed Forces in hopes of acquiring a huge Loudoun County mansion. When he left his home in rural Appalachia to enroll at West Point, his reasons were patriotism and public service —as was almost universally true among members of his generation.

These selfless motives persist in today's military—but perhaps to a lesser degree. Social and financial corruption frequently start at the top, and when American generals leverage their military careers to become multi-millionaires, many colonels, majors, and captains may begin thinking along similar lines.

Indeed, America's explicit doctrine of substituting payment for public spirit and personal integrity has reached new levels of absurdity in our Iraq policies. One-fifth—some $100 billion—of our military spending in Iraq has gone to private contractors. This category includes the many tens of thousands of "security contractors"—private mercenaries—who constitute an important fraction of the occupation forces.

Many of these are South Africans, Brazilians, or French, the traditional "wild geese" who have long traveled the world in search of lucrative wars to fight. But a disturbingly high number are American. When experienced soldiers can quit the Army and immediately return to Iraq as hired guns, making five or six times their previous salaries, they might easily conclude that national military service is merely for the gullible. Thus some fraction of today's bloated Pentagon budget is actually spent to lure America's best troops into abandoning their military careers, thereby hollowing out our ground forces.

Some adventuresome neocon pundits have even suggested opening the American Armed Forces to any foreigners willing to join. In return for high pay and automatic citizenship, they need only march wherever their officers tell them to march and shoot whomever their officers tell them to shoot. There is a long record of ugly precedents for countries that choose to replace their national militaries with foreign mercenaries, but history experts who have never read a history book might remain unaware of this.

Although such massive corruption is without modern American precedent, the Iraq War's parallels to Vietnam are obvious. Liberal pundits are reluctant to note the similarities, lest they be denounced as "unpatriotic" by their bellicose conservative colleagues. But Bill Odom suffered no such qualms. When he saw Vietnam recurring, he said so— and dared anyone to contradict him.

As a staff officer in Saigon, he witnessed firsthand the utter futility and disastrous consequences of that war, both for that country and for the cohesion of the American military. Years later, he pointed out that since the strategic rationale had been to contain China, our war with Hanoi made no sense, given that the Vietnamese were traditionally

the strongest local adversaries of the Chinese and indeed fought a bloody border war with China almost immediately after America's departure. Also, Soviet Russia was America's great antagonist during that period, and containing China was a key Russian objective, so our war was actually fought on behalf of our leading international adversary. The true reason we spent so many years sacrificing vast quantities of American blood, money, and credibility in the jungles of Southeast Asia was that ending the war would be an admission that American leaders had made a horrible mistake in beginning it.

Following 9/11, our Mideast strategy became similarly irrational. Odom noted that Saddam Hussein, a secular Arab nationalist, had for decades been the greatest regional enemy of both the Iranians and radical Islamists such as Osama bin Laden. Therefore, our Iraq War was serving the interests of these hostile, anti-American powers. And for several years now, it has been obvious that the single greatest reason America does not withdraw from Iraq is the fear of acknowledging our blunder.

When I first met Bill Odom in the early 1990s, shortly after the Cold War ended and he had become director of the National Security Program at the Hudson Institute, he was hopeful that America would become more of a "normal country." His last book, begun at the end of the 1990s with Robert Dujarric, one of my college roommates, was entitled *America's Inadvertent Empire*. It analyzed the United States' enormous military, economic, technological, and cultural power but never considered that those assets might be turned to wars of imperial conquest and occupation.

Of course, Sept. 11 changed everything. Since that date America has begun behaving as an exceptionally abnormal country, and Odom's disappearance means our leaders' dangerous course is even less likely to receive honest analysis. Days before his death, Odom had co-authored a *Washington Post* piece with Brzezinski, urging an immediate strategic rapprochement with Iran as a means of stabilizing Iraq pursuant to an American withdrawal. The *Post* had finally become willing to publish Odom's views, but his counsel seemed to fall on deaf ears. The danger of an American attack on Iran may have since faded —presumably being embroiled in two wars makes the Pentagon cautious about starting another —but belligerent rhetoric continues to issue from all major political candidates. America has 200,000 troops occupying Iraq on the other side of the world and has already caused the deaths of over 1 million Iraqi civilians, but American leaders still regularly denounce Iran for its "interference" in its next-door neighbor. Bill Odom smiled at politicians who demonstrate such

political blindness.

The most chilling of his public pronouncements has received little attention, though it might be regarded as his last will and testament to the country he loved. In early April, he and a number of other prominent military critics of the Iraq War were called to give Congressional testimony. All criticized the occupation and urged a rapid American withdrawal, but Odom went farther. He said that without prompt action, Baghdad could become America's Dien Bien Phu, where superior French forces were surrounded, trapped, cut off from supplies, and ultimately destroyed by Vietnamese guerrillas.

The comparison is not as absurd as it might seem. America possesses a powerful force in Iraq, but, as military analyst William Lind has repeatedly emphasized, that force is almost entirely dependent on a long and slender supply line from Kuwait, which runs through territory controlled by Shi'ite forces friendly to Iran. Some 500 tanker trucks of fuel must reach the American Army each day for it to maintain operational mobility. If widespread guerrilla action were to reduce substantially the number or transit speed of those convoys, America's advantage in advanced hardware—our primary strength—would become increasingly irrelevant.

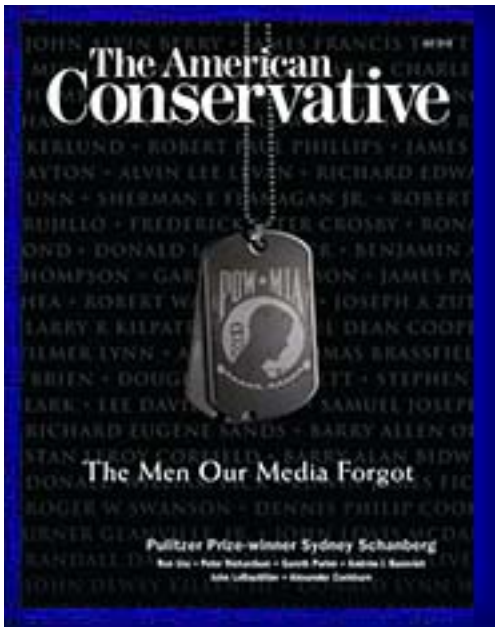
Under such a scenario, any American president who finally issued a command to withdraw would be forced to abandon vast amounts of military hardware, thereby publicly formalizing the greatest defeat in American history. But any president who did not issue such a humiliating withdrawal order would risk the total loss of America's huge expeditionary force. That result would rank with the greatest military disasters in all history—enormously worse than Dien Bien Phu, and comparable in scale to the doomed Sicilian Expedition of the Athenians.

As a serious scholar, Bill Odom knew his Thucydides. But the country he leaves behind does not.

# Was Rambo Right?

*Hundreds of POWs may have been left to die in Vietnam, abandoned by their government—and our media.*

May 25, 2010 • 1,300 Words



In the closing days of the 2008 presidential campaign, I clicked an ambiguous link on an obscure website and stumbled into a parallel universe.

During the previous two years of that long election cycle, the media narrative surrounding Sen. John McCain had been one of unblemished heroism and selfless devotion to his fellow servicemen. Thousands of stories on television and in print had told of his brutal torture at the hands of his North Vietnamese captors, his steely refusal to crack, and his later political career aimed at serving the needs of fellow Vietnam veterans. This storyline had first reached the national stage during his 2000 campaign, then returned with even greater force as he successfully sought the 2008 Republican nomination. Seemingly accepted by all, this history became a centerpiece of his campaign. McCain's supporters touted his heroism as proof that he possessed the character to be entrusted with America's highest office, while his detractors merely sought to change the subject.

Once I clicked that link, I encountered a very different John McCain.

I read copious, detailed evidence that hundreds of American POWs had been condemned to death at enemy hands by top American leaders, apparently because their safe return home would have constituted a major political embarrassment. I found documentation that the cover-up of this betrayal had gone on for decades, eventually drawing in a certain Arizona senator. According to this remarkable reconstruction of events, the average teenage moviegoer of the 1980s watching mindless action films such as "Rambo," "Missing in Action," and "Uncommon Valor" was seeing reality portrayed on screen, while the policy expert reading sober articles in the pages of *The New Republic* and *The Atlantic* was absorbing lies and propaganda. Since I had been believing those very articles, this was a stunning revelation.

But was this alternate description of reality correct? Could this one article be true and all the countless contrary pieces I had read in America's most prestigious publications be false, merely the presentation of official propaganda endlessly repeated? I cannot say. I am not an expert on the history of the Vietnam War and its aftermath.

Yet consider the source. The author of that remarkable 8,000-word exposé—"McCain and the POW Cover-Up," published on The Nation Institute's website—was Sydney Schanberg, one of America's foremost Vietnam War journalists. His reporting won him a Pulitzer Prize, and his subsequent book on Cambodia was made into "The Killing Fields," an Oscar-winning movie. Schanberg later served as one of the highest-ranking editors at the *New York Times*, with a third of the reporters at our national newspaper of record working under him. A case can be made that no living American journalist can write with greater credibility on Vietnam War matters. And he had labored for years researching and exhaustively documenting the story of American POWs abandoned in Indochina—a story that if true might easily represent the single greatest act of national dishonor ever committed by our political leaders.

He presented a mass of evidence with names, dates, and documentary detail. Many of the individuals mentioned are still alive and could be interviewed or called to testify. Sealed government records could be ordered unsealed. If America wishes to determine the truth, it can do so.

Yet what I found most remarkable about Schanberg's essay were not its explosive historical claims but the absolute silence with which they

were received in the mainstream media. In 2008, John McCain's heroic war record and personal patriotism were central to his quest for supreme power—a goal he came very close to achieving. But when one of America's most eminent journalists published an exhaustive report that the candidate had instead served as one of the leading figures in a monumental act of national treachery, our media took no notice. McCain's public critics and the operatives of his Democratic opponent might eagerly seize upon every rumor that the senator had had a private lunch with a disreputable corporate lobbyist, but they ignored documented claims that he had covered up the killing of hundreds of American POWs. These allegations were serious enough and sufficiently documented to warrant national attention—yet they received none.

All of this might seem unimaginable except that it falls into a strong pattern of the press avoiding stories of overwhelming importance. Consider how many of the national disasters of the past few years have been caused by the unwillingness of our major media to question official truths or the widespread beliefs of our elites. The Iraq "cakewalk" to eliminate Saddam's WMDs, the nationwide housing bubble, and the Madoff swindle might have been prevented or would never have reached such massive proportions if reporters and editors had been willing to investigate and present claims contrary to the soothing blandishments of the powerful. Instead, it has become the norm for press outlets simply to repeat, with a few word substitutions, stories indistinguishable from those previously published by dozens of other press outlets, without ever examining any contrary evidence that might raise doubts about this perceived reality. Truth has come to mean the lies that everyone believes.

A couple of years ago, in one of my last exchanges with my late friend Lt. Gen. Bill Odom, who ran the National Security Agency for President Ronald Reagan, we agreed a case could be made that today's major American media had become just as dishonest and unreliable as the old Soviet propaganda outlets of the late 1970s. At the time, we were discussing the coverage of our road to the Iraq War, but subsequent events have demonstrated that this national illness is far more advanced than either of us had suspected. Whether or not Schanberg is proven correct, the shameful cowardice of our mainstream media is already proven by the wall of silence surrounding his work.

In an attempt to breach that wall, we present Schanberg's account of how his remarkable story was buried, as well as his explosive original article. *TAC* has also convened a symposium of critics drawn from

military, political, and journalism backgrounds to explain how this report could have failed to reach a mass audience. A small political magazine does not have the resources to investigate the detailed evidence of Schanberg's case, but we can hold a mirror up to America's major media and force them to see what stories they now regard as completely non-newsworthy.

And if Schanberg's claims are indeed correct, they reveal the lethal consequences of America's overweening national pride. After all, his history is a simple one. Following the battle of Dien Bien Phu in 1954, the Vietnamese refused to return their French POWs unless Paris agreed to pay financial compensation for the war. The French leaders paid the money and got their men back. Similarly, the Vietnamese refused to return their American POWs unless the U.S. government agreed to pay reparations. Nixon signed a document promising to do exactly that, but the Vietnamese, being cautious, kept many of the POWs back until the money was delivered. Then Congress refused to authorize the funds because "America doesn't lose wars." Nixon and later U.S. leaders never acknowledged the fate of these captives lest the American people become outraged. And as the years and decades went by, and various schemes to ransom or rescue the POWs were considered and rejected, their continued existence became a major liability to numerous powerful political figures, whose reputations would have been destroyed if any of the prisoners ever returned and told his story to the American people. So none of them ever came home.

# China's Rise, America's Fall

*Which superpower is more threatened by its extractive elites?*

April 17, 2012 • 6,700 Words

The rise of China surely ranks among the most important world developments of the last 100 years. With America still trapped in its fifth year of economic hardship, and the Chinese economy poised to surpass our own before the end of this decade, China looms very large on the horizon. We are living in the early years of what journalists once dubbed "The Pacific Century," yet there are worrisome signs it may instead become known as "The Chinese Century."

But does the Chinese giant have feet of clay? In a recently published book, *Why Nations Fail*, economists Daron Acemoglu and James A. Robinson characterize China's ruling elites as "extractive"—parasitic and corrupt—and predict that Chinese economic growth will soon falter and decline, while America's "inclusive" governing institutions have taken us from strength to strength. They argue that a country governed as a one-party state, without the free media or checks and balances of our own democratic system, cannot long prosper in the modern world. The glowing tributes this book has

received from a vast array of America's most prominent public intellectuals, including six Nobel laureates in economics, testifies to the widespread popularity of this optimistic message.

Yet do the facts about China and America really warrant this conclusion?

## China Shakes the World

By the late 1970s, three decades of Communist central planning had managed to increase China's production at a respectable rate, but with tremendous fits and starts, and often at a terrible cost: 35 million or more Chinese had starved to death during the disastrous 1959–1961 famine caused by Mao's forced industrialization policy of the Great Leap Forward.

China's population had also grown very rapidly during this period, so the typical standard of living had improved only slightly, perhaps 2 percent per year between 1958 and 1978, and this from an extremely low base. Adjusted for purchasing power, most Chinese in 1980 had an income 60–70 percent below that of the citizens in other major Third World countries such as Indonesia, Nigeria, Pakistan, and Kenya, none of which were considered great economic success stories. In those days, even Haitians were far wealthier than Chinese.

All this began to change very rapidly once Deng Xiaoping initiated his free-market reforms in 1978, first throughout the countryside and eventually in the smaller industrial enterprises of the coastal provinces. By 1985, *The Economist* ran a cover story praising China's 700,000,000 peasants for having doubled their agricultural production in just seven years, an achievement almost unprecedented in world history. Meanwhile, China's newly adopted one-child policy, despite its considerable unpopularity, had sharply reduced population growth rates in a country possessing relatively little arable land.

A combination of slowing population growth and rapidly accelerating economic output has obvious implications for national prosperity. During the three decades to 2010, China achieved perhaps the most rapid sustained rate of economic development in the history of the human species, with its real economy growing almost 40-fold between 1978 and 2010. In 1978, America's economy was 15 times larger, but according to most international estimates, China is now set to surpass America's total economic output within just another few years.

Furthermore, the vast majority of China's newly created economic

wealth has flowed to ordinary Chinese workers, who have moved from oxen and bicycles to the verge of automobiles in just a single generation. While median American incomes have been stagnant for almost forty years, those in China have nearly doubled every decade, with the real wages of workers outside the farm-sector rising about 150 percent over the last ten years alone. The Chinese of 1980 were desperately poor compared to Pakistanis, Nigerians, or Kenyans; but today, they are several times wealthier, representing more than a tenfold shift in relative income.

A World Bank report recently highlighted the huge drop in global poverty rates from 1980 to 2008, but critics noted that over 100 percent of that decline came from China alone: the number of Chinese living in dire poverty fell by a remarkable 662 million, while the impoverished population in the rest of the world actually rose by 13 million. And although India is often paired with China in the Western media, a large fraction of Indians have actually grown poorer over time. The bottom half of India's still rapidly growing population has seen its daily caloric intake steadily decline for the last 30 years, with half of all children under five now being malnourished.

China's economic progress is especially impressive when matched against historical parallels. Between 1870 and 1900, America enjoyed unprecedented industrial expansion, such that even Karl Marx and his followers began to doubt that a Communist revolution would be necessary or even possible in a country whose people were achieving such widely shared prosperity through capitalistic expansion. During those 30 years America's real per capita income grew by 100 percent. But over the last 30 years, real per capita income in China has grown by more than 1,300 percent.

Over the last decade alone, China quadrupled its industrial output, which is now comparable to that of the U.S. In the crucial sector of automobiles, China raised its production ninefold, from 2 million cars in 2000 to 18 million in 2010, a figure now greater than the combined totals for America and Japan. China accounted for fully 85 percent of the total world increase in auto manufacturing during that decade.

It is true that many of China's highest-tech exports are more apparent than real. Nearly all Apple's iPhones and iPads come from China, but this is largely due to the use of cheap Chinese labor for final assembly, with just 4 percent of the value added in those world-leading items being Chinese. This distorts Chinese trade statistics, leading to unnecessary friction. However, some high-tech China exports are indeed fully Chinese, notably those of Huawei, which now ranks

alongside Sweden's Ericsson as one of the world's two leading telecommunications manufacturers, while once powerful North American competitors such Lucent-Alcatel and Nortel have fallen into steep decline or even bankruptcy. And although America originally pioneered the Human Genome Project, the Beijing Genomics Institute (BGI) today probably stands as the world leader in that enormously important emerging scientific field.

China's recent rise should hardly surprise us. For most of the last 3,000 years, China together with the Mediterranean world and its adjoining European peninsula have constituted the two greatest world centers of technological and economic progress. During the 13th century, Marco Polo traveled from his native Venice to the Chinese Empire and described the latter as vastly wealthier and more advanced than any European country. As late as the 18th century, many leading European philosophers such as Voltaire often looked to Chinese society as an intellectual exemplar, while both the British and the Prussians used the Chinese mandarinate as their model for establishing a meritocratic civil service based on competitive examinations.

Even a century ago, near the nadir of China's later weakness and decay, some of America's foremost public intellectuals, such as Edward A. Ross and Lothrop Stoddard, boldly predicted the forthcoming restoration of the Chinese nation to global influence, the former with equanimity and the latter with serious concern. Indeed, Stoddard argued that only three major inventions effectively separated the world of classical antiquity from that of 18th-century Europe—gunpowder, the mariner's compass, and the printing press. All three seem to have first appeared in China, though for various social, political, and ideological reasons, none were properly implemented.

Does China's rise necessarily imply America's decline? Not at all: human economic progress is not a zero-sum game. Under the right circumstances, the rapid development of one large country should tend to improve living standards for the rest of the world.

This is most obvious for those nations whose economic strengths directly complement those of a growing China. Massive industrial expansion clearly requires a similar increase in raw-material consumption, and China is now the world's largest producer and user of electricity, concrete, steel, and many other basic materials, with its iron-ore imports surging by a factor of ten between 2000 and 2011. This has driven huge increases in the costs of most commodities; for example, copper's world price rose more than eightfold during the last

decade. As a direct consequence, these years have generally been very good ones for the economies of countries that heavily rely upon the export of natural resources—Australia, Russia, Brazil, Saudi Arabia, and parts of Africa.

Meanwhile, as China's growth gradually doubles total world industrial production, the resulting "China price" reduces the cost of manufactured goods, making them much more easily affordable to everyone, and thereby greatly increases the global standard of living. While this process may negatively impact those particular industries and countries directly competing with China, it provides enormous opportunities as well, not merely to the aforementioned raw-material suppliers but also to countries like Germany, whose advanced equipment and machine tools have found a huge Chinese market, thereby helping to reduce German unemployment to the lowest level in 20 years.

And as ordinary Chinese grow wealthier, they provide a larger market as well for the goods and services of leading Western companies, ranging from fast-food chains to consumer products to luxury goods. Chinese workers not only assemble Apple's iPhones and iPads, but are also very eager to purchase them, and China has now become that company's second largest market, with nearly all of the extravagant profit margins flowing back to its American owners and employees. In 2011 General Motors sold more cars in China than in the U.S., and that rapidly growing market became a crucial factor in the survival of an iconic American corporation. China has become the third largest market in the world for McDonald's, and the main driver of global profits for the American parent company of Pizza Hut, Taco Bell, and KFC.

## Social Costs of a Rapid Rise

Transforming a country in little more than a single generation from a land of nearly a billion peasants to one of nearly a billion city-dwellers is no easy task, and such a breakneck pace of industrial and economic development inevitably leads to substantial social costs. Chinese urban pollution is among the worst in the world, and traffic is rapidly heading toward that same point. China now contains the second largest number of billionaires after America, together with more than a million dollar-millionaires, and although many of these individuals came by their fortunes honestly, many others did not. Official corruption is a leading source of popular resentment against the various levels of Chinese government, ranging from local village

councils to the highest officials in Beijing.

But we must maintain a proper sense of proportion. As someone who grew up in Los Angeles when it still had the most notorious smog in America, I recognize that such trends can be reversed with time and money, and indeed the Chinese government has expressed intense interest in the emerging technology of non-polluting electric cars. Rapidly growing national wealth can be deployed to solve many problems.

Similarly, plutocrats who grow rich through friends in high places or even outright corruption are easier to tolerate when a rising tide is rapidly lifting all boats. Ordinary Chinese workers have increased their real income by well over 1,000 percent in recent decades, while the corresponding figure for most American workers has been close to zero. If typical American wages were doubling every decade, there would be far less anger in our own society directed against the "One Percent." Indeed, under the standard GINI index used to measure wealth inequality, China's score is not particularly high, being roughly the same as that of the United States, though certainly indicating greater inequality than most of the social democracies of Western Europe.

Many American pundits and politicians still focus their attention on the tragic Tiananmen Square incident of 1989, during which hundreds of determined Chinese protesters were massacred by government troops. But although that event loomed very large at the time, in hindsight it generated merely a blip in the upward trajectory of China's development and today seems virtually forgotten among ordinary Chinese, whose real incomes have increased several-fold in the quarter century since then.

Much of the Tiananmen protest had been driven by popular outrage at government corruption, and certainly there have been additional major scandals in recent years, often heavily splashed across the pages of America's leading newspapers. But a closer examination paints a more nuanced picture, especially when contrasted with America's own situation.

For example, over the last few years one of the most ambitious Chinese projects has been a plan to create the world's largest and most advanced network of high-speed rail transport, an effort that absorbed a remarkable $200 billion of government investment. The result was the construction of over 6,000 miles of track, a total probably now greater than that of all the world's other nations combined.

Unfortunately, this project also involved considerable corruption, as was widely reported in the world media, which estimated that hundreds of millions of dollars had been misappropriated through bribery and graft. This scandal eventually led to the arrest or removal of numerous government officials, notably including China's powerful Railways Minister.

Obviously such serious corruption would seem horrifying in a country with the pristine standards of a Sweden or a Norway. But based on the published accounts, it appears that the funds diverted amounted to perhaps as little as 0.2 percent of the total, with the remaining 99.8 percent generally spent as intended. So serious corruption notwithstanding, the project succeeded and China does indeed now possess the world's largest and most advanced network of high-speed rail, constructed almost entirely in the last five or six years.

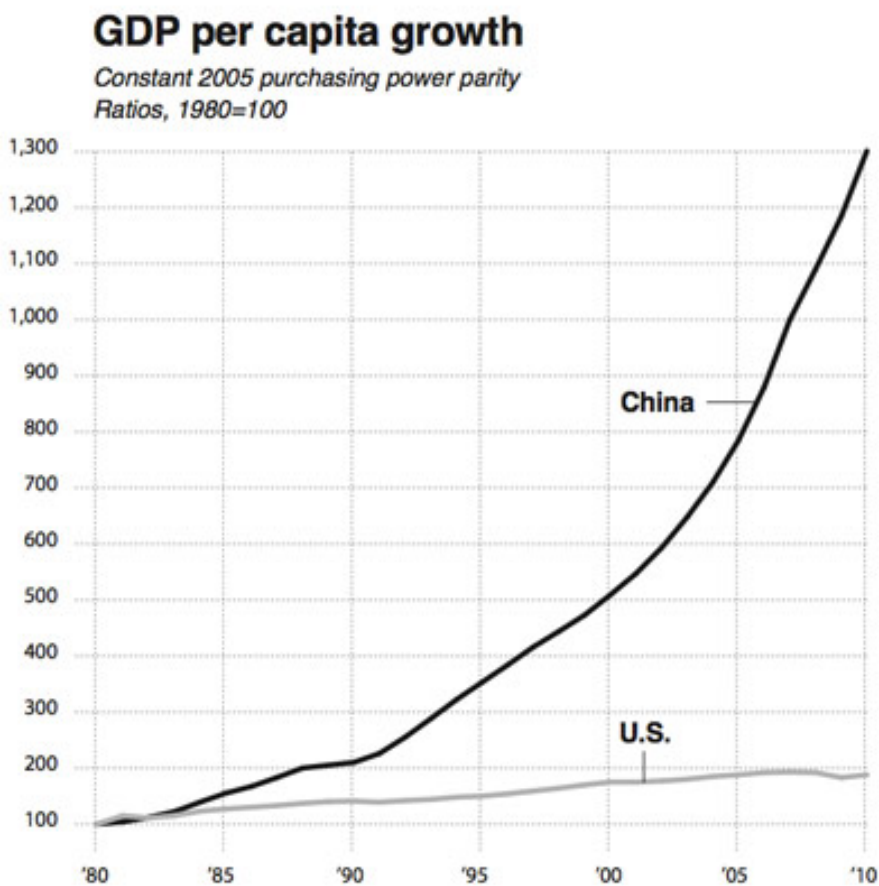
Meanwhile, America has no high-speed rail whatsoever, despite decades of debate and vast amounts of time and money spent on lobbying, hearings, political campaigns, planning efforts, and environmental-impact reports. China's high-speed rail system may be far from perfect, but it actually exists, while America's does not. Annual Chinese ridership now totals over 25 million trips per year, and although an occasional disaster—such as the 2011 crash in Weizhou, which killed 40 passengers—is tragic, it is hardly unexpected. After all, America's aging low-speed trains are not exempt from similar calamities, as we saw in the 2008 Chatsworth crash that killed 25 in California.

For many years Western journalists regularly reported that the dismantling of China's old Maoist system of government-guaranteed healthcare had led to serious social stresses, forcing ordinary workers to save an unreasonable fraction of their salaries to pay for medical treatment if they or their families became ill. But over the last couple of years, the government has taken major steps to reduce this problem by establishing a national healthcare insurance system whose coverage now extends to 95 percent or so of the total population, a far better ratio than is found in wealthy America and at a tiny fraction of the cost. Once again, competent leaders with access to growing national wealth can effectively solve these sorts of major social problems.

Although Chinese cities have negligible crime and are almost entirely free of the horrible slums found in many rapidly urbanizing Third World countries, housing for ordinary workers is often quite inadequate. But national concerns over rising unemployment due to

the global recession gave the government a perfect opportunity late last year to announce a bold plan to construct over 35 million modern new government apartments, which would then be provided to ordinary workers on a subsidized basis.

All of this follows the pattern of Lee Kwan Yew's mixed-development model, combining state socialism and free enterprise, which raised Singapore's people from the desperate, abject poverty of 1945 to a standard of living now considerably higher than that of most Europeans or Americans, including a per capita GDP almost $12,000 above that of the United States. Obviously, implementing such a program for the world's largest population and on a continental scale is far more challenging than doing so in a tiny city-state with a population of a few million and inherited British colonial institutions, but so far China has done very well in confounding its skeptics.



## America's Economic Decline

These facts do not provide much evidence for the thesis in *Why Nations Fail* that China's leaders constitute a self-serving and venal "extractive" elite. Unfortunately, such indications seem far more apparent when we direct our gaze inward, toward the recent economic and social trajectory of our own country

Against the backdrop of remarkable Chinese progress, America mostly presents a very gloomy picture. Certainly America's top engineers and entrepreneurs have created many of the world's most important technologies, sometimes becoming enormously wealthy in the process. But these economic successes are not typical nor have their benefits been widely distributed. Over the last 40 years, a large majority of American workers have seen their real incomes stagnate or decline.

Meanwhile, the rapid concentration of American wealth continues apace: the richest 1 percent of America's population now holds as much net wealth as the bottom 90–95 percent, and these trends may even be accelerating. A recent study revealed that during our supposed recovery of the last couple of years, 93 percent of the total increase in national income went to the top 1 percent, with an astonishing 37 percent being captured by just the wealthiest 0.01 percent of the population, 15,000 households in a nation of well over 300 million people.

Evidence for the long-term decline in our economic circumstances is most apparent when we consider the situation of younger Americans. The national media endlessly trumpets the tiny number of youthful Facebook millionaires, but the prospects for most of their contemporaries are actually quite grim. According to research from the Pew Center, barely half of 18- to 24-year-old Americans are currently employed, the lowest level since 1948, a time long before most women had joined the labor force. Nearly one-fifth of young men age 25–34 are still living with their parents, while the wealth of all households headed by those younger than 35 is 68 percent lower today than it was in 1984.

The total outstanding amount of non-dischargeable student-loan debt has crossed the trillion-dollar mark, now surpassing the combined total of credit-card and auto-loan debt—and with a quarter of all student-loan payers now delinquent, there are worrisome indicators that much of it will remain a permanent burden, reducing many millions to long-term debt peonage. A huge swath of America's younger generation seems completely impoverished, and likely to remain so.

International trade statistics, meanwhile, demonstrate that although Apple and Google are doing quite well, our overall economy is not. For many years now our largest goods export has been government IOUs, whose dollar value has sometimes been greater than that of the next ten categories combined. At some point, perhaps sooner than we think, the rest of the world will lose its appetite for this non-functional product, and our currency will collapse, together with our standard of living. Similar Cassandra-like warnings were issued for years about the housing bubble or the profligacy of the Greek government, and were proven false year after year until one day they suddenly became true.

Ironically enough, there is actually one major category in which American expansion still easily tops that of China, both today and for the indefinite future: population growth. The rate of America's demographic increase passed that of China over 20 years ago and has been greater every year since, sometimes by as much as a factor of two. According to standard projections, China's population in 2050 will be almost exactly what it was in 2000, with the country having achieved the population stability typical of advanced, prosperous societies. But during that same half-century, the number of America's inhabitants will have grown by almost 50 percent, a rate totally unprecedented in the developed world and actually greater than that found in numerous Third World countries such as Colombia, Algeria, Thailand, Mexico, or Indonesia. A combination of very rapid population growth and doubtful prospects for equally rapid economic growth does not bode well for the likely quality of the 2050 American Dream.

China rises while America falls, but are there major causal connections between these two concurrent trends now reshaping the future of our world? Not that I can see. American politicians and pundits are naturally fearful of taking on the fierce special interest groups that dominate their political universe, so they often seek an external scapegoat to explicate the misery of their constituents, sometimes choosing to focus on China. But this is merely political theater for the ignorant and the gullible.

Various studies have suggested that China's currency may be substantially undervalued, but even if the frequent demands of Paul Krugman and others were met and the yuan rapidly appreciated another 15 or 20 percent, few industrial jobs would return to American shores, while working-class Americans might pay much more for their basic necessities. And if China opened wide its borders to more American movies or financial services, the multimillionaires of Hollywood and Wall Street might grow even richer, but ordinary

Americans would see little benefit. It is always easier for a nation to point an accusing finger at foreigners rather than honestly admit that almost all its terrible problems are essentially self-inflicted.

## Decay of Constitutional Democracy

The central theme of *Why Nations Fail* is that political institutions and the behavior of ruling elites largely determine the economic success or failure of countries. If most Americans have experienced virtually no economic gains for decades, perhaps we should cast our gaze at these factors in our own society.

Our elites boast about the greatness of our constitutional democracy, the wondrous human rights we enjoy, the freedom and rule of law that have long made America a light unto the nations of the world and a spiritual draw for oppressed peoples everywhere, including China itself. But are these claims actually correct? They often stack up very strangely when they appear in the opinion pages of our major newspapers, coming just after the news reporting, whose facts tell a very different story.

Just last year, the Obama administration initiated a massive months-long bombing campaign against the duly recognized government of Libya on humanitarian grounds, then argued with a straight face that a military effort comprising hundreds of bombing sorties and over a billion dollars in combat costs did not actually constitute warfare, and hence was completely exempt from the established provisions of the Congressional War Powers Act. A few months later, Congress overwhelmingly passed and President Obama signed the National Defense Authorization Act, granting the president power to permanently imprison without trial or charges any American whom he classifies as a national-security threat based on his own judgment and secret evidence. When we consider that American society has experienced virtually no domestic terrorism during the past decade, we must wonder how long our remaining constitutional liberties would survive if we were facing frequent real-life attacks by an actual terrorist underground, such as had been the case for many years with the IRA in Britain, ETA in Spain, or the Red Brigades in Italy.

Most recently, President Obama and Attorney General Eric Holder have claimed the inherent right of an American president to summarily execute anyone anywhere in the world, American citizen or not, whom White House advisors have privately decided was a bad person. While it is certainly true that major world

governments have occasionally assassinated their political enemies abroad, I have never before heard these dark deeds publicly proclaimed as legitimate and aboveboard. Certainly if the governments of Russia or China, let alone Iran, declared their inherent right to kill anyone anywhere in the world whom they didn't like, our media pundits would immediately blast these statements as proof of their total criminal insanity.

These are very strange notions of the "rule of law" for the administration of a president who had once served as top editor of the *Harvard Law Review* and who was routinely flattered in his political campaigns by being described as a "constitutional scholar."

Many of these negative ideological trends have been absorbed and accepted by the popular culture and much of the American public. Over the last decade one of the highest-rated shows on American television was "24", created by Joel Surnow and chronicling Kiefer Sutherland as a patriotic but ruthless Secret Service agent, with each episode constituting a single hour of his desperate efforts to thwart terrorist plots and safeguard our national security. Numerous episodes featured our hero torturing suspected evildoers in order to extract the information necessary to save innocent lives, with the entire series representing a popular weekly glorification of graphic government torture on behalf of the greater good.

Now soft-headed protestations to the contrary, most governments around the world have at least occasionally practiced torture, especially when combating popular insurgencies, and some of the more brutal regimes, including Stalinist Russia and Nazi Germany, even professionalized the process. But such dark deeds done in secret were always vigorously denied in public, and the popular films and other media of Stalin's Soviet Union invariably featured pure-hearted workers and peasants bravely doing their honorable and patriotic duty for the Motherland, rather than the terrible torments being daily inflicted in the cellars of the Lubyanka prison. Throughout all of modern history, I am not aware of a single even semi-civilized country that publicly celebrated the activities of its professional government torturers in the popular media. Certainly such sentiments would have been totally abhorrent and unthinkable in the "conservative Hollywood" of the Cold War 1950s.

And since we live in a entertainment-dominated society, sentiments affirmed on the screen often have direct real-world consequences. At one point, senior American military and counter-terrorism officials felt the need to travel to Hollywood and urge its screenwriters to stop

glorifying American torture, since their shows were encouraging U.S. soldiers to torture Muslim captives even when their commanding officers repeatedly ordered them not to do so.

Given these facts, we should hardly be surprised that international surveys over the past decade have regularly ranked America as the world's most hated major nation, a remarkable achievement given the dominant global role of American media and entertainment and also the enormous international sympathy that initially flowed to our country following the 9/11 attacks.

## An Emerging One-Party State

So far at least, these extra-constitutional and often brutal methods have not been directed toward controlling America's own political system; we remain a democracy rather than a dictatorship. But does our current system actually possess the central feature of a true democracy, namely a high degree of popular influence over major government policies? Here the evidence seems more ambiguous.

Consider the pattern of the last decade. With two ruinous wars and a financial collapse to his record, George W. Bush was widely regarded as one of the most disastrous presidents in American history, and at times his public approval numbers sank to the lowest levels ever measured. The sweeping victory of his successor, Barack Obama, represented more a repudiation of Bush and his policies than anything else, and leading political activists, left and right alike, characterized Obama as Bush's absolute antithesis, both in background and in ideology. This sentiment was certainly shared abroad, with Obama being selected for the Nobel Peace Prize just months after entering office, based on the widespread assumption that he was certain to reverse most of the policies of his detested predecessor and restore America to sanity.

Yet almost none of these reversals took place. Instead, the continuity of administration policy has been so complete and so obvious that many critics now routinely speak of the Bush/Obama administration.

The harsh violations of constitutional principles and civil liberties which Bush pioneered following the 9/11 attacks have only further intensified under Obama, the heralded Harvard constitutional scholar and ardent civil libertarian, and this has occurred without the excuse of any major new terrorist attacks. During his Democratic primary campaign, Obama promised that he would move to end Bush's futile

Iraq War immediately upon taking office, but instead large American forces remained in place for years until heavy pressure from the Iraqi government finally forced their removal; meanwhile, America's occupation army in Afghanistan actually tripled in size. The government bailout of the hated financial manipulators of Wall Street, begun under Bush, continued apace under Obama, with no serious attempts at either government prosecution or drastic reform. Americans are still mostly suffering through the worst economic downturn since the Great Depression, but Wall Street profits and multimillion-dollar bonuses soon returned to record levels.

In particular, the continuity of top officials has been remarkable. As Bush's second defense secretary, Robert Gates had been responsible for the ongoing management of America's foreign wars and military occupations since 2006; Obama kept him on, and he continued to play the same role in the new administration. Similarly, Timothy Geithner had been one of Bush's most senior financial appointments, playing a crucial role in the widely unpopular financial bailout of Wall Street; Obama promoted him to Treasury secretary and authorized continuation of those same policies. Ben Bernanke had been appointed chairman of the Federal Reserve by Bush and was reappointed by Obama. Bush wars and bailouts became Obama wars and bailouts. The American public voted for an anti-Bush, but got Bush's third term instead.

During the Cold War, Soviet propagandists routinely characterized our democracy as a sham, with the American public merely selecting which of the two intertwined branches of their single political party should alternate in office, while the actual underlying policies remained essentially unchanged, being decided and implemented by the same corrupt ruling class. This accusation may have been mostly false at the time it was made but seems disturbingly accurate today.

When times are hard and government policies are widely unpopular, but voters are only offered a choice between the rival slick marketing campaigns of Coke and Pepsi, cynicism can reach extreme proportions. Over the last year, surveys have shown that the public non-approval of Congress—representing Washington's political establishment—has ranged as high as 90–95 percent, which is completely unprecedented.

But if our government policies are so broadly unpopular, why are we unable to change them through the sacred power of the vote? The answer is that America's system of government has increasingly morphed from being a representative democracy to becoming

something closer to a mixture of plutocracy and mediacracy, with elections almost entirely determined by money and media, not necessarily in that order. Political leaders are made or broken depending on whether they receive the cash and visibility needed to win office.

National campaigns increasingly seem sordid reality shows for second-rate political celebrities, while our country continues along its path toward multiple looming calamities. Candidates who depart from the script or deviate from the elite D.C. consensus regarding wars or bailouts—notably a principled ideologue such as Ron Paul—are routinely stigmatized in the media as dangerous extremists or even entirely airbrushed out of campaign news coverage, as has been humorously highlighted by comedian Jon Stewart.

We know from the collapsed communist states of Eastern Europe that control over the media may determine public perceptions of reality, but it does not change the underlying reality itself, and reality usually has the last laugh. Economics Nobel Laureate Joseph Stiglitz and his colleagues have conservatively estimated the total long-term cost of our disastrous Iraq War at $3 trillion, representing over one-fifth of our entire accumulated national debt, or almost $30,000 per American household. And even now the direct ongoing costs of our Afghanistan War still run $120 billion per year, many times the size of Afghanistan's total GDP. Meanwhile, during these same years the international price of oil has risen from $25 to $125 per barrel—partly as a consequence of these past military disruptions and growing fears of future ones—thereby imposing gigantic economic costs upon our society.

And we suffer other costs as well. A recent *New York Times* story described the morale-building visit of Secretary of Defense Leon Panetta to our forces in Afghanistan and noted that all American troops had been required to surrender their weapons before attending his speech and none were allowed to remain armed in his vicinity. Such a command decision seems almost unprecedented in American history and does not reflect well upon the perceived state of our military morale.

Future historians may eventually regard these two failed wars, fought for entirely irrational reasons, as the proximate cause of America's financial and political collapse, representing the historical bookend to our World War II victory, which originally established American global dominance.

## Our Extractive Elites

When parasitic elites govern a society along "extractive" lines, a central feature is the massive upward flow of extracted wealth, regardless of any contrary laws or regulations. Certainly America has experienced an enormous growth of officially tolerated corruption as our political system has increasingly consolidated into a one-party state controlled by a unified media-plutocracy.

Consider the late 2011 collapse of MF Global, a midsize but highly reputable brokerage firm. Although this debacle was far smaller than the Lehman bankruptcy or the Enron fraud, it effectively illustrates the incestuous activities of America's overlapping elites. Just a year earlier, Jon Corzine had been installed as CEO, following his terms as Democratic governor and U.S. senator from New Jersey and his previous career as CEO of Goldman Sachs. Perhaps no other American had such a combination of stellar political and financial credentials on his resume. Soon after taking the reins, Corzine decided to boost his company's profits by betting its entire capital and more against the possibility that any European countries might default on their national debts. When he lost that bet, his multi-billion-dollar firm tumbled into bankruptcy.

At this point, the story moves from a commonplace tale of Wall Street arrogance and greed into something out of the Twilight Zone, or perhaps Monty Python. The major newspapers began reporting that customer funds, eventually said to total $1.6 billion, had mysteriously disappeared during the collapse, and no one could determine what had become of them, a very strange claim in our age of massively computerized financial records. Weeks and eventually months passed, tens of millions of dollars were spent on armies of investigators and forensic accountants, but all those customer funds stayed "missing," while the elite media covered this bizarre situation in the most gingerly possible fashion. As an example, a front page *Wall Street Journal* story on February 23, 2012 suggested that after so many months, there seemed little likelihood that the disappeared customer funds might ever reappear, but also emphasized that absolutely no one was being accused of any wrongdoing. Presumably the journalists were suggesting that the $1.6 billion dollars of customer money had simply walked out the door on its own two feet.

Stories like this give the lie to the endless boasts of our politicians and business pundits that America's financial system is the most transparent and least corrupt in today's world. Certainly America is

not unique in the existence of long-term corporate fraud, as was recently shown in the fall of Japan's Olympus Corporation following the discovery of more than a billion dollars in long-hidden investment losses. But when we consider the largest corporate collapses of the last decade that were substantially due to fraud, nearly all the names are American: WorldCom, Enron, Tyco, Global Crossing, and Adelphia. And this list leaves out all the American financial institutions destroyed by the financial meltdown—such as Lehman, Bear Stearns, Merrill Lynch, Washington Mutual, and Wachovia—and the many trillions of dollars in American homeowner equity and top-rated MBS securities which evaporated during that process. Meanwhile, the largest and longest Ponzi Scheme in world history, that of Bernie Madoff, had survived for decades under the very nose of the SEC, despite a long series of detailed warnings and complaints. The second largest such fraud, that of Allen R. Stanford, also bears the label "Made in the USA."

Some of the sources of Chinese success and American decay are not entirely mysterious. As it happens, the typical professional background of a member of China's political elite is engineering; they were taught to build things. Meanwhile, a remarkable fraction of America's political leadership class attended law school, where they were trained to argue effectively and to manipulate. Thus, we should not be greatly surprised that while China's leaders tend to build, America's leaders seem to prefer endless manipulation, whether of words, money, or people.

How corrupt is the American society fashioned by our current ruling elites? That question is perhaps more ambiguous than it might seem. According to the standard world rankings produced by Transparency International, the United States is a reasonably clean country, with corruption being considerably higher than in the nations of Northern Europe or elsewhere in the Anglosphere, but much lower than in most of the rest of the world, including China.

But I suspect that this one-dimensional metric fails to capture some of the central anomalies of America's current social dilemma. Unlike the situation in many Third World countries, American teachers and tax inspectors very rarely solicit bribes, and there is little overlap in personnel between our local police and the criminals whom they pursue. Most ordinary Americans are generally honest. So by these basic measures of day-to-day corruption, America is quite clean, not too different from Germany or Japan.

By contrast, local village authorities in China have a notorious

tendency to seize public land and sell it to real estate developers for huge personal profits. This sort of daily misbehavior has produced an annual Chinese total of up to 90,000 so-called "mass incidents"—public strikes, protests, or riots—usually directed against corrupt local officials or businessmen.

However, although American micro-corruption is rare, we seem to suffer from appalling levels of macro-corruption, situations in which our various ruling elites squander or misappropriate tens or even hundreds of billions of dollars of our national wealth, sometimes doing so just barely on one side of technical legality and sometimes on the other.

Sweden is among the cleanest societies in Europe, while Sicily is perhaps the most corrupt. But suppose a large clan of ruthless Sicilian Mafiosi moved to Sweden and somehow managed to gain control of its government. On a day-to-day basis, little would change, with Swedish traffic policemen and building inspectors performing their duties with the same sort of incorruptible efficiency as before, and I suspect that Sweden's Transparency International rankings would scarcely decline. But meanwhile, a large fraction of Sweden's accumulated national wealth might gradually be stolen and transferred to secret Cayman Islands bank accounts, or invested in Latin American drug cartels, and eventually the entire plundered economy would collapse.

Ordinary Americans who work hard and seek to earn an honest living for themselves and their families appear to be suffering the ill effects of exactly this same sort of elite-driven economic pillage. The roots of our national decline will be found at the very top of our society, among the One Percent, or more likely the 0.1 percent.

Thus, the ideas presented in *Why Nations Fail* seem both true and false. The claim that harmful political institutions and corrupt elites can inflict huge economic damage upon a society seems absolutely correct. But while the authors turn a harsh eye toward elite misbehavior across time and space—from ancient Rome to Czarist Russia to rising China—their vision seems to turn rosy-tinted when they consider present-day America, the society in which they themselves live and whose ruling elites lavishly fund the academic institutions with which they are affiliated. Given the American realities of the last dozen years, it is quite remarkable that the scholars who wrote a book entitled *Why Nations Fail* never glanced outside their own office windows.

A similar dangerous reticence may afflict most of our media, which appears much more eager to focus on self-inflicted disasters in foreign countries than on those here at home. Presented below is a companion case-study, "Chinese Melamine and American Vioxx: A Comparison," in which I point out that while the American media a few years ago joined its Chinese counterparts in devoting enormous coverage to the deaths of a few Chinese children from tainted infant formula, it paid relatively little attention to a somewhat similar domestic public-health disaster that killed many tens or even hundreds of thousands of Americans.

A society's media and academic organs constitute the sensory apparatus and central nervous system of its body politic, and if the information these provide is seriously misleading, looming dangers may fester and grow. A media and academy that are highly corrupt or dishonest constitute a deadly national peril. And although the political leadership of undemocratic China might dearly wish to hide all its major mistakes, its crude propaganda machinery often fails at this self-destructive task. But America's own societal information system is vastly more skilled and experienced in shaping reality to meet the needs of business and government leaders, and this very success does tremendous damage to our country.

Perhaps Americans really do prefer that their broadcasters provide Happy News and that their political campaigns constitute amusing reality shows. Certainly the cheering coliseum crowds of the Roman Empire favored their bread and circuses over the difficult and dangerous tasks that their ancestors had undertaken during Rome's rise to world greatness. And so long as we can continue to trade bits of printed paper carrying presidential portraits for flat-screen TVs from Chinese factories, perhaps all is well and no one need be too concerned about the apparent course of our national trajectory, least of all our political leadership class.

But if so, then we must admit that Richard Lynn, a prominent British scholar, has been correct in predicting for a decade or longer that the global dominance of the European-derived peoples is rapidly drawing to its end and within the foreseeable future the torch of human progress and world leadership will inevitably pass into Chinese hands.

# Chinese Melamine and American Vioxx: A Comparison

April 17, 2012 • 1,800 Words

In contrasting China and America, pundits often cite our free and independent media as one of our greatest strengths, together with the tremendous importance which our society places upon individual American lives. For us, a single wrongful death can sometimes provoke weeks of massive media coverage and galvanize the nation into corrective action, while life remains cheap in China, a far poorer land of over a billion people, ruled by a ruthless Communist Party eager to bury its mistakes. But an examination of two of the greatest public-health scandals of the last few years casts serious doubt on this widespread belief.

First, consider the details of the Chinese infant formula scandal of 2008. Unscrupulous businessmen had discovered they could save money by greatly diluting their milk products, then adding a plastic chemical compound called melamine to raise the apparent protein content back to normal levels. Nearly 300,000 babies throughout China had suffered urinary problems, with many hundreds requiring lengthy hospitalization for kidney stones. Six died. A wave of popular outrage swept past the controlled media roadblocks and initial government excuses, and soon put enormous pressure on Chinese officials to take forceful action against the wrongdoers.

China's leaders may not be democratically elected, but they pay close attention to strong popular sentiment. Once pressed, they quickly launched a national police investigation which led to a series of arrests and uncovered evidence that this widespread system of food adulteration had been protected by bribe-taking government officials. Long prison sentences were freely handed out and a couple of the guiltiest culprits were eventually tried and executed for their role, measures that gradually assuaged popular anger. Indeed, the former head of the Chinese FDA had been executed for corruption in late 2007 under similar circumstances.

Throughout these events, American media coverage was extensive, with numerous front-page stories in our leading newspapers. Journalists discovered that similar methods of dangerous chemical adulteration had been used to produce Chinese pet food for export,

and many family dogs in America had suffered or died as a result. With heavy coverage on talk radio and cable news shows, phrases such as "Chinese baby formula" or "Chinese pet food" became angry slurs, and there was talk of banning whole categories of imports from a country whose product safety standards were obviously so far below those found in Western societies. The legitimate concerns of ordinary Americans were fanned by local media coverage that sometimes bordered on the hysterical.

However, the American media reaction had been quite different during an earlier health scandal much closer to home.

In September 2004, Merck, one of America's largest pharmaceutical companies, suddenly announced that it was voluntarily recalling Vioxx, its popular anti-pain medication widely used to treat arthritis-related ailments. This abrupt recall came just days after Merck discovered that a top medical journal was about to publish a massive study by an FDA investigator indicating that the drug in question greatly increased the risk of fatal heart attacks and strokes and had probably been responsible for at least 55,000 American deaths during the five years it had been on the market.

Within weeks of the recall, journalists discovered that Merck had found strong evidence of the potentially fatal side-effects of this drug even before its initial 1999 introduction, but had ignored these worrisome indicators and avoided additional testing, while suppressing the concerns of its own scientists. Boosted by a television advertising budget averaging a hundred million dollars per year, Vioxx soon became one of Merck's most lucrative products, generating over $2 billion in yearly revenue. Merck had also secretly ghostwritten dozens of the published research studies emphasizing the beneficial aspects of the drug and encouraging doctors to widely prescribe it, thus transforming science into marketing support. Twenty-five million Americans were eventually prescribed Vioxx as an aspirin-substitute thought to produce fewer complications.

Although the Vioxx scandal certainly did generate several days of newspaper headlines and intermittently returned to the front pages as the resulting lawsuits gradually moved through our judicial system, the coverage still seemed scanty relative to the number of estimated fatalities, which matched America's total losses in the Vietnam War. In fact, the media coverage often seemed considerably less than that later accorded to the Chinese infant food scandal, which had caused just a handful of deaths on the other side of the world.

The circumstances of this case were exceptionally egregious, with many tens of thousands of American deaths due to the sale of a highly lucrative but sometimes fatal drug, whose harmful effects had long been known to its manufacturer. But there is no sign that criminal charges were ever considered.

A massive class-action lawsuit dragged its way through the courts for years, eventually being settled for $4.85 billion in 2007, with almost half the money going to the trial lawyers. Merck shareholders also paid large sums to settle various other lawsuits and government penalties and cover the heavy legal costs of fighting all of these cases. But the loss of continuing Vioxx sales represented the greatest financial penalty of all, which provides a disturbing insight into the cost-benefit calculations behind the company's original cover-up. When the scandal broke, Merck's stock price collapsed, and there was a widespread belief that the company could not possibly survive, especially after evidence of a deliberate corporate conspiracy surfaced. Instead, Merck's stock price eventually reached new heights in 2008 and today is just 15 percent below where it stood just before the disaster.

Furthermore, individuals make decisions rather than corporate entities, and none of the individuals behind Merck's deadly decisions apparently suffered any serious consequences. The year after the scandal unfolded, Merck's long-time CEO resigned and was replaced by one of his top lieutenants, but he retained the $50 million in financial compensation he had received over the previous five years, compensation greatly boosted by lucrative Vioxx sales. Senior FDA officials apologized for their lack of effective oversight and promised to do better in the future. American media conglomerates quietly mourned their loss of heavy Vioxx advertising, but continued selling the same airtime to Merck and its rivals for the marketing of other, replacement drugs, while their investigative arms soon focused on the horrors of tainted Chinese infant food and the endemic corruption of Chinese society.

This story of serious corporate malfeasance largely forgiven and forgotten by government and media is depressing enough, but it leaves out a crucial factual detail that seems to have almost totally escaped public notice. The year after Vioxx had been pulled from the market, the *New York Times* and other major media outlets published a minor news item, generally buried near the bottom of their back pages, which noted that American death rates had suddenly undergone a striking and completely unexpected decline.

The headline of the short article that ran in the April 19, 2005 edition of *USA Today* was typical: "USA Records Largest Drop in Annual Deaths in at Least 60 Years." During that one year, American deaths had fallen by 50,000 despite the growth in both the size and the age of the nation's population. Government health experts were quoted as being greatly "surprised" and "scratching [their] heads" over this strange anomaly, which was led by a sharp drop in fatal heart attacks.

On April 24, 2005, the *New York Times* ran another of its long stories about the continuing Vioxx controversy, disclosing that Merck officials had knowingly concealed evidence that their drug greatly increased the risk of heart-related fatalities. But the *Times* journalist made no mention of the seemingly inexplicable drop in national mortality rates that had occurred once the drug was taken off the market, although the news had been reported in his own paper just a few days earlier.

A cursory examination of the most recent 15 years worth of national mortality data provided on the Centers for Disease Control and Prevention website offers some intriguing clues to this mystery. We find the largest rise in American mortality rates occurred in 1999, the year Vioxx was introduced, while the largest drop occurred in 2004, the year it was withdrawn. Vioxx was almost entirely marketed to the elderly, and these substantial changes in national death-rate were completely concentrated within the 65-plus population. The FDA studies had proven that use of Vioxx led to deaths from cardiovascular diseases such as heart attacks and strokes, and these were exactly the factors driving the changes in national mortality rates.

The impact of these shifts was not small. After a decade of remaining roughly constant, the overall American death rate began a substantial decline in 2004, soon falling by approximately 5 percent, despite the continued aging of the population. This drop corresponds to roughly 100,000 fewer deaths per year. The age-adjusted decline in death rates was considerably greater.

Patterns of cause and effect cannot easily be proven. But if we hypothesize a direct connection between the recall of a class of very popular drugs proven to cause fatal heart attacks and other deadly illnesses with an immediate drop in the national rate of fatal heart attacks and other deadly illnesses, then the statistical implications are quite serious. Perhaps 500,000 or more premature American deaths may have resulted from Vioxx, a figure substantially larger than the 3,468 deaths of named individuals acknowledged by Merck during the settlement of its lawsuit. And almost no one among our political or media elites seems to know or care about this possibility. A recent

*Wall Street Journal* column even called for relaxing FDA restrictions aimed at avoiding rare adverse events, which had been imposed after the discovery of unanticipated side effects of high-profile drugs like Vioxx.

There are obvious mitigating differences between these two national responses. The Chinese victims were children, and their sufferings from kidney stones and other ailments were directly linked to the harmful compounds that they had ingested. By contrast, the American victims were almost all elderly, and there was no means of determining whether a particular heart attack had been caused by Vioxx or other factors; the evidence implicating the drug was purely statistical, across millions of patients. Furthermore, since most of the victims were anyway nearing the end of their lives, the result was more an acceleration of the inevitable rather than cutting short an entire young life, and sudden fatal heart attacks are hardly the most unpleasant forms of death.

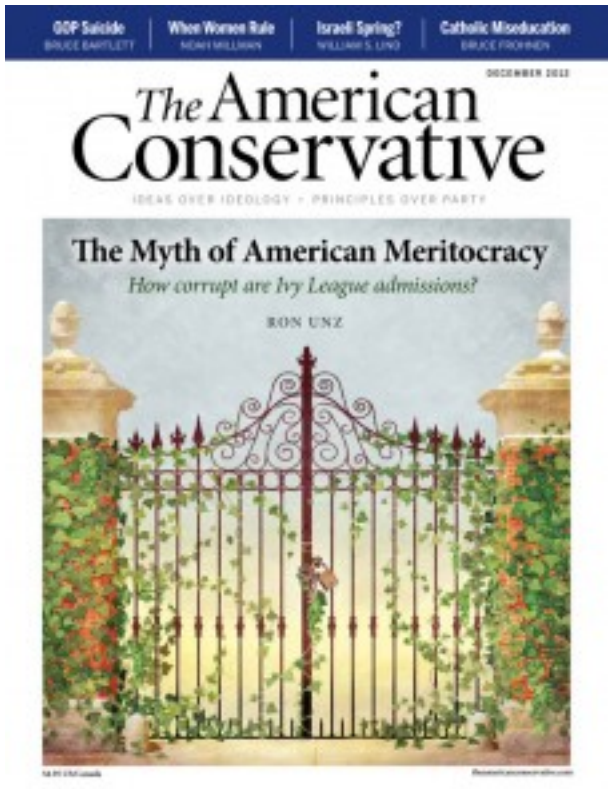
But against these important factors we must consider the raw numbers involved. American journalists seemed to focus more attention on a half-dozen fatalities in China than they did on the premature deaths of as many as 500,000 of their fellow American citizens.

The inescapable conclusion is that in today's world and in the opinion of our own media, American lives are quite cheap, unlike those in China.

# The Myth of American Meritocracy

*Are elite university admissions based on meritocracy and diversity as claimed?*

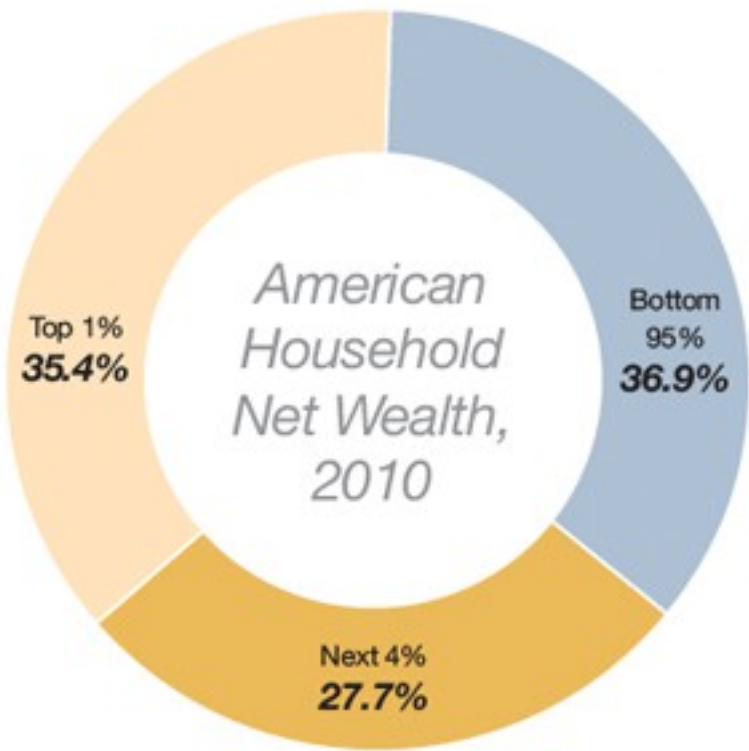
November 28, 2012 • 26,200 Words



Just before the Labor Day weekend, a front page *New York Times* story broke the news of the largest cheating scandal in Harvard University history, in which nearly half the students taking a Government course on the role of Congress had plagiarized or otherwise illegally collaborated on their final exam.[1] Each year, Harvard admits just 1600 freshmen while almost 125 Harvard students now face possible suspension over this single incident. A Harvard dean described the situation as "unprecedented."

But should we really be so surprised at this behavior among the students at America's most prestigious academic institution? In the last generation or two, the funnel of opportunity in American society has

drastically narrowed, with a greater and greater proportion of our financial, media, business, and political elites being drawn from a relatively small number of our leading universities, together with their professional schools. The rise of a Henry Ford, from farm boy mechanic to world business tycoon, seems virtually impossible today, as even America's most successful college dropouts such as Bill Gates and Mark Zuckerberg often turn out to be extremely well-connected former Harvard students. Indeed, the early success of Facebook was largely due to the powerful imprimatur it enjoyed from its exclusive availability first only at Harvard and later restricted to just the Ivy League.



During this period, we have witnessed a huge national decline in well-paid middle class jobs in the manufacturing sector and other sources of employment for those lacking college degrees, with median American wages having been stagnant or declining for the last forty years. Meanwhile, there has been an astonishing concentration of wealth at the top, with America's richest 1 percent now possessing nearly as much net wealth as the bottom 95 percent.[2] This situation, sometimes described as a winner take all society, leaves families desperate to maximize the chances that their children will reach the

winners' circle, rather than risk failure and poverty or even merely a spot in the rapidly deteriorating middle class. And the best single means of becoming such an economic winner is to gain admission to a top university, which provides an easy ticket to the wealth of Wall Street or similar venues, whose leading firms increasingly restrict their hiring to graduates of the Ivy League or a tiny handful of other top colleges.[3] On the other side, finance remains the favored employment choice for Harvard, Yale or Princeton students after the diplomas are handed out.[4]

## The Battle for Elite College Admissions

As a direct consequence, the war over college admissions has become astonishingly fierce, with many middle- or upper-middle class families investing quantities of time and money that would have seemed unimaginable a generation or more ago, leading to an all-against-all arms race that immiserates the student and exhausts the parents. The absurd parental efforts of an Amy Chua, as recounted in her 2010 bestseller *Battle Hymn of the Tiger Mother*, were simply a much more extreme version of widespread behavior among her peer-group, which is why her story resonated so deeply among our educated elites. Over the last thirty years, America's test-prep companies have grown from almost nothing into a $5 billion annual industry, allowing the affluent to provide an admissions edge to their less able children. Similarly, the enormous annual tuition of $35,000 charged by elite private schools such as Dalton or Exeter is less for a superior high school education than for the hope of a greatly increased chance to enter the Ivy League.[5] Many New York City parents even go to enormous efforts to enroll their children in the best possible pre-Kindergarten program, seeking early placement on the educational conveyer belt which eventually leads to Harvard.[6] Others cut corners in a more direct fashion, as revealed in the huge SAT cheating rings recently uncovered in affluent New York suburbs, in which students were paid thousands of dollars to take SAT exams for their wealthier but dimmer classmates.[7]

But given such massive social and economic value now concentrated in a Harvard or Yale degree, the tiny handful of elite admissions gatekeepers enjoy enormous, almost unprecedented power to shape the leadership of our society by allocating their supply of thick envelopes. Even billionaires, media barons, and U.S. Senators may weigh their words and actions more carefully as their children approach college age. And if such power is used to select our future elites in a corrupt manner, perhaps the inevitable result is the

selection of corrupt elites, with terrible consequences for America. Thus, the huge Harvard cheating scandal, and perhaps also the endless series of financial, business, and political scandals which have rocked our country over the last decade or more, even while our national economy has stagnated.

Just a few years ago Pulitzer Prize-winning former *Wall Street Journal* reporter Daniel Golden published *The Price of Admission*, a devastating account of the corrupt admissions practices at so many of our leading universities, in which every sort of non-academic or financial factor plays a role in privileging the privileged and thereby squeezing out those high-ability, hard-working students who lack any special hook. In one particularly egregious case, a wealthy New Jersey real estate developer, later sent to Federal prison on political corruption charges, paid Harvard $2.5 million to help ensure admission of his completely under-qualified son.[8] When we consider that Harvard's existing endowment was then at $15 billion and earning almost $7 million each day in investment earnings, we see that a culture of financial corruption has developed an absurd illogic of its own, in which senior Harvard administrators sell their university's honor for just a few hours worth of its regular annual income, the equivalent of a Harvard instructor raising a grade for a hundred dollars in cash.

An admissions system based on non-academic factors often amounting to institutionalized venality would seem strange or even unthinkable among the top universities of most other advanced nations in Europe or Asia, though such practices are widespread in much of the corrupt Third World. The notion of a wealthy family buying their son his entrance into the Grandes Ecoles of France or the top Japanese universities would be an absurdity, and the academic rectitude of Europe's Nordic or Germanic nations is even more severe, with those far more egalitarian societies anyway tending to deemphasize university rankings.

Or consider the case of China. There, legions of angry microbloggers endlessly denounce the official corruption and abuse which permeate so much of the economic system. But we almost never hear accusations of favoritism in university admissions, and this impression of strict meritocracy determined by the results of the national *Gaokao* college entrance examination has been confirmed to me by individuals familiar with that country. Since all the world's written exams may ultimately derive from China's old imperial examination system, which was kept remarkably clean for 1300 years, such practices are hardly surprising.[9] Attending a prestigious college is regarded by ordinary Chinese as their children's greatest hope of rapid upward

mobility and is therefore often a focus of enormous family effort; China's ruling elites may rightly fear that a policy of admitting their own dim and lazy heirs to leading schools ahead of the higher-scoring children of the masses might ignite a widespread popular uprising. This perhaps explains why so many sons and daughters of top Chinese leaders attend college in the West: enrolling them at a third-rate Chinese university would be a tremendous humiliation, while our own corrupt admissions practices get them an easy spot at Harvard or Stanford, sitting side by side with the children of Bill Clinton, Al Gore, and George W. Bush.

Although the evidence of college admissions corruption presented in Golden's book is quite telling, the focus is almost entirely on current practices, and largely anecdotal rather than statistical. For a broader historical perspective, we should consider *The Chosen* by Berkeley sociologist Jerome Karabel, an exhaustive and award-winning 2005 narrative history of the last century of admissions policy at Harvard, Yale, and Princeton (I will henceforth sometimes abbreviate these "top three" most elite schools as "HYP").

Karabel's massive documentation—over 700 pages and 3000 endnotes—establishes the remarkable fact that America's uniquely complex and subjective system of academic admissions actually arose as a means of covert ethnic tribal warfare. During the 1920s, the established Northeastern Anglo-Saxon elites who then dominated the Ivy League wished to sharply curtail the rapidly growing numbers of Jewish students, but their initial attempts to impose simple numerical quotas provoked enormous controversy and faculty opposition.[10] Therefore, the approach subsequently taken by Harvard President A. Lawrence Lowell and his peers was to transform the admissions process from a simple objective test of academic merit into a complex and holistic consideration of all aspects of each individual applicant; the resulting opacity permitted the admission or rejection of any given applicant, allowing the ethnicity of the student body to be shaped as desired. As a consequence, university leaders could honestly deny the existence of any racial or religious quotas, while still managing to reduce Jewish enrollment to a much lower level, and thereafter hold it almost constant during the decades which followed.[11] For example, the Jewish portion of Harvard's entering class dropped from nearly 30 percent in 1925 to 15 percent the following year and remained roughly static until the period of the Second World War.[12]

As Karabel repeatedly demonstrates, the major changes in admissions policy which later followed were usually determined by factors of raw political power and the balance of contending forces rather than any

idealistic considerations. For example, in the aftermath of World War II, Jewish organizations and their allies mobilized their political and media resources to pressure the universities into increasing their ethnic enrollment by modifying the weight assigned to various academic and non-academic factors, raising the importance of the former over the latter. Then a decade or two later, this exact process was repeated in the opposite direction, as the early 1960s saw black activists and their liberal political allies pressure universities to bring their racial minority enrollments into closer alignment with America's national population by partially shifting away from their recently enshrined focus on purely academic considerations. Indeed, Karabel notes that the most sudden and extreme increase in minority enrollment took place at Yale in the years 1968–69, and was largely due to fears of race riots in heavily black New Haven, which surrounded the campus.[13]

Philosophical consistency appears notably absent in many of the prominent figures involved in these admissions battles, with both liberals and conservatives sometimes favoring academic merit and sometimes non-academic factors, whichever would produce the particular ethnic student mix they desired for personal or ideological reasons. Different political blocs waged long battles for control of particular universities, and sudden large shifts in admissions rates occurred as these groups gained or lost influence within the university apparatus: Yale replaced its admissions staff in 1965 and the following year Jewish numbers nearly doubled.[14]

At times, external judicial or political forces would be summoned to override university admissions policy, often succeeding in this aim. Karabel's own ideological leanings are hardly invisible, as he hails efforts by state legislatures to force Ivy League schools to lift their *de facto* Jewish quotas, but seems to regard later legislative attacks on "affirmative action" as unreasonable assaults on academic freedom.[15] The massively footnoted text of *The Chosen* might lead one to paraphrase Clausewitz and conclude that our elite college admissions policy often consists of ethnic warfare waged by other means, or even that it could be summarized as a simple Leninesque question of "Who, Whom?"

Although nearly all of Karabel's study is focused on the earlier history of admissions policy at Harvard, Yale, and Princeton, with the developments of the last three decades being covered in just a few dozen pages, he finds complete continuity down to the present day, with the notorious opacity of the admissions process still allowing most private universities to admit whomever they want for whatever

reasons they want, even if the reasons and the admissions decisions may eventually change over the years. Despite these plain facts, Harvard and the other top Ivy League schools today publicly deny any hint of discrimination along racial or ethnic lines, except insofar as they acknowledge providing an admissions boost to under-represented racial minorities, such as blacks or Hispanics. But given the enormous control these institutions exert on our larger society, we should test these claims against the evidence of the actual enrollment statistics.

## Asian-Americans as the ﷽New Jews﷽

The overwhelming focus of Karabel's book is on changes in Jewish undergraduate percentages at each university, and this is probably less due to his own ethnic heritage than because the data provides an extremely simple means of charting the ebb and flow of admissions policy: Jews were a high-performing group, whose numbers could only be restricted by major deviations from an objective meritocratic standard.

Obviously, anti-Jewish discrimination in admissions no longer exists at any of these institutions, but a roughly analogous situation may be found with a group whom Golden and others have sometimes labeled ﷽The New Jews,﷽ namely Asian-Americans. Since their strong academic performance is coupled with relatively little political power, they would be obvious candidates for discrimination in the harsh realpolitik of university admissions as documented by Karabel, and indeed he briefly raises the possibility of an anti-Asian admissions bias, before concluding that the elite universities are apparently correct in denying that it exists.[16]

There certainly does seem considerable anecdotal evidence that many Asians perceive their chances of elite admission as being drastically reduced by their racial origins.[17] For example, our national newspapers have revealed that students of part-Asian background have regularly attempted to conceal the non-white side of their ancestry when applying to Harvard and other elite universities out of concern it would greatly reduce their chances of admission.[18] Indeed, widespread perceptions of racial discrimination are almost certainly the primary factor behind the huge growth in the number of students refusing to reveal their racial background at top universities, with the percentage of Harvard students classified as ﷽race unknown﷽ having risen from almost nothing to a regular 5–15 percent of all undergraduates over the last twenty years, with similar levels reached at other elite schools.

Such fears that checking the "Asian" box on an admissions application may lead to rejection are hardly unreasonable, given that studies have documented a large gap between the average test scores of whites and Asians successfully admitted to elite universities. Princeton sociologist Thomas J. Espenshade and his colleagues have demonstrated that among undergraduates at highly selective schools such as the Ivy League, white students have mean scores 310 points higher on the 1600 SAT scale than their black classmates, but Asian students average 140 points above whites.[19] The former gap is an automatic consequence of officially acknowledged affirmative action policies, while the latter appears somewhat mysterious.

These broad statistical differences in the admission requirements for Asians are given a human face in Golden's discussions of this subject, in which he recounts numerous examples of Asian-American students who overcame dire family poverty, immigrant adversity, and other enormous personal hardships to achieve stellar academic performance and extracurricular triumphs, only to be rejected by all their top university choices. His chapter is actually entitled "The New Jews," and he notes the considerable irony that a university such as Vanderbilt will announce a public goal of greatly increasing its Jewish enrollment and nearly triple those numbers in just four years, while showing very little interest in admitting high-performing Asian students.[20]

All these elite universities strongly deny the existence of any sort of racial discrimination against Asians in the admissions process, let alone an "Asian quota," with senior administrators instead claiming that the potential of each student is individually evaluated via a holistic process far superior to any mechanical reliance on grades or test scores; but such public postures are identical to those taken by their academic predecessors in the 1920s and 1930s as documented by Karabel. Fortunately, we can investigate the plausibility of these claims by examining the decades of officially reported enrollment data available from the website of the National Center for Educational Statistics (NCES).

The ethnic composition of Harvard undergraduates certainly follows a highly intriguing pattern. Harvard had always had a significant Asian-American enrollment, generally running around 5 percent when I had attended in the early 1980s. But during the following decade, the size of America's Asian middle class grew rapidly, leading to a sharp rise in applications and admissions, with Asians exceeding 10 percent of

undergraduates by the late 1980s and crossing the 20 percent threshold by 1993. However, from that year forward, the Asian numbers went into reverse, generally stagnating or declining during the two decades which followed, with the official 2011 figure being 17.2 percent.[21]

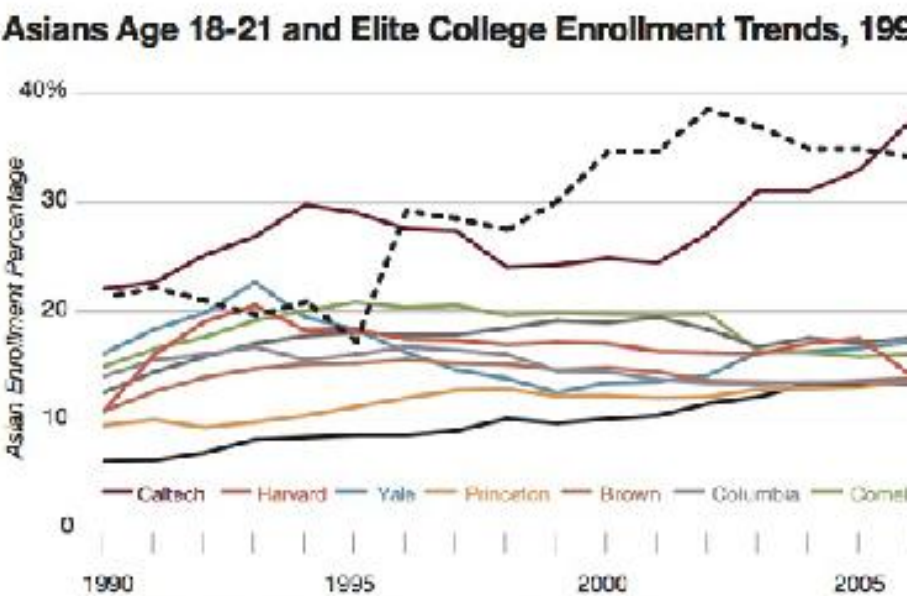
Even more surprising has been the sheer constancy of these percentages, with almost every year from 1995–2011 showing an Asian enrollment within a single point of the 16.5 percent average, despite huge fluctuations in the number of applications and the inevitable uncertainty surrounding which students will accept admission. By contrast, prior to 1993 Asian enrollment had often changed quite substantially from year to year. It is interesting to note that this exactly replicates the historical pattern observed by Karabel, in which Jewish enrollment rose very rapidly, leading to imposition of an informal quota system, after which the number of Jews fell substantially, and thereafter remained roughly constant for decades. On the face of it, ethnic enrollment levels which widely diverge from academic performance data or application rates and which remain remarkably static over time provide obvious circumstantial evidence for at least a *de facto* ethnic quota system.

In another strong historical parallel, all the other Ivy League universities seem to have gone through similar shifts in Asian enrollment at similar times and reached a similar plateau over the last couple of decades. As mentioned, the share of Asians at Harvard peaked at over 20 percent in 1993, then immediately declined and thereafter remained roughly constant at a level 3–5 points lower. Asians at Yale reached a 16.8 percent maximum in that same year, and soon dropped by about 3 points to a roughly constant level. The Columbia peak also came in 1993 and the Cornell peak in 1995, in both cases followed by the same substantial drop, and the same is true for most of their East Coast peers. During the mid- to late-1980s, there had been some public controversy in the media regarding allegations of anti-Asian discrimination in the Ivy League, and the Federal Government eventually even opened an investigation into the matter.[22] But once that investigation was closed in 1991, Asian enrollments across all those universities rapidly converged to the same level of approximately 16 percent, and remained roughly static thereafter (See chart below). In fact, the yearly fluctuations in Asian enrollments are often smaller than were the changes in Jewish numbers during the "quota era" of the past,[23] and are roughly the same relative size as the fluctuations in black enrollments, even

though the latter are heavily influenced by the publicly declared "ethnic diversity goals" of those same institutions.

The largely constant Asian numbers at these elite colleges are particularly strange when we consider that the underlying population of Asians in America has been anything but static, instead growing at the fastest pace of any American racial group, having increased by almost 50 percent during the last decade, and more than doubling since 1993. Obviously, the relevant ratio would be to the 18–21 age cohort, but adjusting for this factor changes little: based on Census data, the college-age ratio of Asians to whites increased by 94 percent between 1994 and 2011, even while the ratio of Asians to whites at Harvard and Columbia fell over these same years.[24]

Put another way, the percentage of college-age Asian-Americans attending Harvard peaked around 1993, and has since dropped by over 50 percent, a decline somewhat larger than the fall in Jewish enrollment which followed the imposition of secret quotas in 1925.[25] And we have noted the parallel trends in the other Ivy League schools, which also replicates the historical pattern.



Trends of Asian enrollment at Caltech and the Ivy League universities, co
college-age population; Asian age cohort population figures are based on C

sample size, are subject to considerable yearly statistical fluctuations. S

Furthermore, during this exact same period a large portion of the Asian-American population moved from first-generation immigrant poverty into the ranks of the middle class, greatly raising their educational aspirations for their children. Although elite universities generally refuse to release their applicant totals for different racial groups, some data occasionally becomes available. Princeton's records show that between 1980 and 1989, Asian-American applications increased by over 400 percent compared to just 8 percent for other groups, with an even more rapid increase for Brown during 1980-1987, while Harvard's Asian applicants increased over 250 percent between 1976 and 1985.[26] It seems likely that the statistics for other Ivy League schools would have followed a similar pattern and these trends would have at least partially continued over the decades which followed, just as the Asian presence has skyrocketed at selective public feeder schools such as Stuyvesant and Bronx Science in New York City and also at the top East Coast prep schools. Yet none of these huge changes in the underlying pool of Asian applicants seemed to have had noticeable impact on the number admitted to Harvard or most of the Ivy League.

## Estimating Asian Merit

One obvious possible explanation for these trends might be a decline in average Asian scholastic performance, which would certainly be possible if more and more Asian students from the lower levels of the ability pool were pursuing an elite education.[27] The mean SAT scores for Asian students show no such large decline, but since we would expect elite universities to draw their students from near the absolute top of the performance curve, average scores by race are potentially less significant than the Asian fraction of America's highest performing students.

To the extent that the hundred thousand or so undergraduates at Ivy League schools and their approximate peers are selected by academic merit, they would mostly be drawn from the top one-half to one percent of their American age-cohort, and this is the appropriate pool to consider. It is perfectly possible that a particular ethnic population might have a relatively high mean SAT score, while still being somewhat less well represented in that top percent or so of measured ability; racial performance does not necessarily follow an exact bell

curve" distribution. For one thing, a Census category such as "Asian" is hardly homogenous or monolithic, with South Asians and East Asians such as Chinese and Koreans generally having much higher performance compared to other groups such as Filipinos, Vietnamese, or Cambodians, just as the various types of "Hispanics" such as Cubans, Mexicans, and Puerto Ricans differ widely in their socio-economic and academic profiles. Furthermore, the percentage of a given group taking the SAT may change over time, and the larger the percentage taking that test, the more that total will include weaker students, thereby depressing the average score.

Fortunately, allegations of anti-Asian admissions bias have become a topic of widespread and heated debate on the Internet, and disgruntled Asian-American activists have diligently located various types of data to support their accusations, with the recent ethnic distribution of National Merit Scholarship (NMS) semifinalists being among the most persuasive. Students receiving this official designation represent approximately the top one-half of one percent of a state's high school students as determined by their scores on the PSAT, twin brother to the SAT. Each year, the NMS Corporation distributes the names and schools of these semifinalists for each state, and dozens of these listings have been tracked down and linked on the Internet by determined activists, who have then sometimes estimated the ethnic distribution of the semifinalists by examining their family names.[28] Obviously, such a name analysis provides merely an approximate result, but the figures are striking enough to warrant the exercise. (All these NMS semifinalist estimates are discussed in Appendix E.)[29]

For example, California has a population comparable to that of the next two largest states combined, and its 2010 total of 2,003 NMS semifinalists included well over 1,100 East Asian or South Asian family names. California may be one of the most heavily Asian states, but even so Asians of high school age are still outnumbered by whites roughly 3-to-1, while there were far more high scoring Asians. Put another way, although Asians represented only about 11 percent of California high school students, they constituted almost 60 percent of the top scoring ones. California's list of NMS semifinalists from 2012 also followed a very similar ethnic pattern. Obviously, such an analysis based on last names is hardly precise, but it is probably correct to within a few percent, which is sufficient for our crude analytical purposes.

In addition, the number of test-takers is sufficiently large that an examination of especially distinctive last names allows us to pinpoint and roughly quantify the academic performance of different Asian

groups. For example, the name ﷺNguyenﷺ is uniquely Vietnamese and carried by about 1 in 3.6 of all Americans of that ethnicity, while ﷺKimﷺ is just as uniquely Korean, with one in 5.5 Korean-Americans bearing that name.[30] By comparing the prevalence of these particular names on the California NMS semifinalist lists with the total size of the corresponding California ethnicities, we can estimate that California Vietnamese are significantly more likely than whites to score very highly on such tests, while Koreans seem to do eight times better than whites and California's Chinese even better still. (All these results rely upon the simplifying assumption that these different Asian groups are roughly proportional in their numbers of high school seniors.)

Interestingly enough, these Asian performance ratios are remarkably similar to those worked out by Nathaniel Weyl in his 1989 book *The Geography of American Achievement*, in which he estimated that Korean and Chinese names were over-represented by 1000 percent or more on the complete 1987 lists of national NMS semifinalists, while Vietnamese names were only somewhat more likely to appear than the white average.[31] This consistency is quite impressive when we consider that America's Asian population has tripled since the late 1980s, with major changes as well in socio-economic distribution and other characteristics.

The results for states other than California reflect this same huge abundance of high performing Asian students. In Texas, Asians are just 3.8 percent of the population but were over a quarter of the NMS semifinalists in 2010, while the 2.4 percent of Florida Asians provided between 10 percent and 16 percent of the top students in the six years from 2008 to 2013 for which I have been able to obtain the NMS lists. Even in New York, which contains one of our nation's most affluent and highly educated white populations and also remains by far the most heavily Jewish state, Asian over-representation was enormous: the Asian 7.3 percent of the population—many of them impoverished immigrant families—accounted for almost one-third of all top scoring New York students.

America's eight largest states contain nearly half our total population as well as over 60 percent of all Asian-Americans, and each has at least one NMS semifinalist list available for the years 2010–2012. Asians account for just 6 percent of the population in these states, but contribute almost one-third of all the names on these rosters of high performing students. Even this result may be a substantial underestimate, since over half these Asians are found in gigantic California, where extremely stiff academic competition has driven the

qualifying NMS semifinalist threshold score to nearly the highest in the country; if students were selected based on a single nationwide standard, Asian numbers would surely be much higher. This pattern extends to the aggregate of the twenty-five states whose lists are available, with Asians constituting 5 percent of the total population but almost 28 percent of semifinalists. Extrapolating these state results to the national total, we would expect 25–30 percent of America's highest scoring high school seniors to be of Asian origin.[32] This figure is far above the current Asian enrollment at Harvard or the rest of the Ivy League.

Ironically enough, the methodology used to select these NMS semifinalists may considerably understate the actual number of very high-ability Asian students. According to testing experts, the three main subcomponents of intellectual ability are verbal, mathematical, and visuospatial, with the last of these representing the mental manipulation of objects. Yet the qualifying NMS scores are based on math, reading, and writing tests, with the last two both corresponding to verbal ability, and without any test of visuospatial skills. Even leaving aside the language difficulties which students from an immigrant background might face, East Asians tend to be weakest in the verbal category and strongest in the visuospatial, so NMS semifinalists are being selected by a process which excludes the strongest Asian component and doubles the weight of the weakest.[33]

This evidence of a massively disproportionate Asian presence among top-performing students only increases if we examine the winners of national academic competitions, especially those in mathematics and science, where judging is the most objective. Each year, America picks its five strongest students to represent our country in the International Math Olympiad, and during the three decades since 1980, some 34 percent of these team members have been Asian-American, with the corresponding figure for the International Computing Olympiad being 27 percent. The Intel Science Talent Search, begun in 1942 under the auspices of the Westinghouse Corporation, is America's most prestigious high school science competition, and since 1980 some 32 percent of the 1320 finalists have been of Asian ancestry (see Appendix F).

Given that Asians accounted for just 1.5 percent of the population in 1980 and often lived in relatively impoverished immigrant families, the longer-term historical trends are even more striking. Asians were

less than 10 percent of U.S. Math Olympiad winners during the 1980s, but rose to a striking 58 percent of the total during the last thirteen years 2000–2012. For the Computing Olympiad, Asian winners averaged about 20 percent of the total during most of the 1990s and 2000s, but grew to 50 percent during 2009–2010 and a remarkable 75 percent during 2011–2012.

The statistical trend for the Science Talent Search finalists, numbering many thousands of top science students, has been the clearest: Asians constituted 22 percent of the total in the 1980s, 29 percent in the 1990s, 36 percent in the 2000s, and 64 percent in the 2010s. In particular science subjects, the Physics Olympiad winners follow a similar trajectory, with Asians accounting for 23 percent of the winners during the 1980s, 25 percent during the 1990s, 46 percent during the 2000s, and a remarkable 81 percent since 2010. The 2003–2012 Biology Olympiad winners were 68 percent Asian and Asians took an astonishing 90 percent of the top spots in the recent Chemistry Olympiads. Some 61 percent of the Siemens AP Awards from 2002–2011 went to Asians, including thirteen of the fourteen top national prizes.

Yet even while all these specific Asian-American academic achievement trends were rising at such an impressive pace, the relative enrollment of Asians at Harvard was plummeting, dropping by over half during the last twenty years, with a range of similar declines also occurring at Yale, Cornell, and most other Ivy League universities. Columbia, in the heart of heavily Asian New York City, showed the steepest decline of all.

There may even be a logical connection between these two contradictory trends. On the one hand, America over the last two decades has produced a rapidly increasing population of college-age Asians, whose families are increasingly affluent, well-educated, and eager to secure an elite education for their children. But on the other hand, it appears that these leading academic institutions have placed a rather strict upper limit on actual Asian enrollments, forcing these Asian students to compete more and more fiercely for a very restricted number of openings. This has sparked a massive Asian-American arms-race in academic performance at high schools throughout the country, as seen above in the skyrocketing math and science competition results. When a far greater volume of applicants is squeezed into a pipeline of fixed size, the pressure can grow enormously.

The implications of such massive pressure may be seen in a widely-discussed front page 2005 *Wall Street Journal* story entitled ﬁThe New

White Flight.[34] The article described the extreme academic intensity at several predominantly Asian high schools in Cupertino and other towns in Silicon Valley, and the resulting exodus of white students, who preferred to avoid such an exceptionally focused and competitive academic environment, which included such severe educational tension. But should the families of those Asian students be blamed if according to Espensade and his colleagues their children require far higher academic performance than their white classmates to have a similar chance of gaining admission to selective colleges?

Although the Asian Tiger Mom behavior described by author Amy Chua provoked widespread hostility and ridicule, consider the situation from her perspective. Being herself a Harvard graduate, she would like her daughters to follow in her own Ivy League footsteps, but is probably aware that the vast growth in Asian applicants with no corresponding increase in allocated Asian slots requires heroic efforts to shape the perfect application package. Since Chua's husband is not Asian, she could obviously encourage her children to improve their admissions chances by concealing their ethnic identity during the application process; but this would surely represent an enormous personal humiliation for a proud and highly successful Illinois-born American of Chinese ancestry.

The claim that most elite American universities employ a *de facto* Asian quota system is certainly an inflammatory charge in our society. Indeed, our media and cultural elites view any accusations of racial discrimination as being among the most horrific of all possible charges, sometimes even regarded as more serious than mass murder.[35] So before concluding that these accusations are probably true and considering possible social remedies, we should carefully reconsider their plausibility, given that they are largely based upon a mixture of circumstantial statistical evidence and the individual anecdotal cases presented by Golden and a small handful of other critical journalists. One obvious approach is to examine enrollment figures at those universities which for one reason or another may follow a different policy.

According to incoming student test scores and recent percentages of National Merit Scholars, four American universities stand at the absolute summit of average student quality—Harvard, Yale, Princeton, and Caltech, the California Institute of Technology; and of these Caltech probably ranks first among equals.[36] Those three top Ivies continue to employ the same admissions system which Karabel describes as opaque, flexible, and allowing enormous discretion,[37] a system originally established to restrict the

admission of high-performing Jews. But Caltech selects its students by strict academic standards, with Golden praising it for being America's shining example of a purely meritocratic university, almost untouched by the financial or political corruption so widespread in our other elite institutions. And since the beginning of the 1990s, Caltech's Asian-American enrollment has risen almost exactly in line with the growth of America's underlying Asian population, with Asians now constituting nearly 40 percent of each class (See chart on p. 18).

Obviously, the Caltech curriculum is narrowly focused on mathematics, science, and engineering, and since Asians tend to be especially strong in those subjects, the enrollment statistics might be somewhat distorted compared to a more academically balanced university. Therefore, we should also consider the enrollment figures for the highly-regarded University of California system, particularly its five most prestigious and selective campuses: Berkeley, UCLA, San Diego, Davis, and Irvine. The 1996 passage of Proposition 209 had outlawed the use of race or ethnicity in admissions decisions, and while administrative compliance has certainly not been absolute—Golden noted the evidence of some continued anti-Asian discrimination—the practices do seem to have moved in the general direction of race-blind meritocracy.[38] And the 2011 Asian-American enrollment at those five elite campuses ranged from 34 percent to 49 percent, with a weighted average of almost exactly 40 percent, identical to that of Caltech.[39]

In considering these statistics, we must take into account that California is one of our most heavily Asian states, containing over one-quarter of the total national population, but also that a substantial fraction of UC students are drawn from other parts of the country. The recent percentage of Asian NMS semifinalists in California has ranged between 55 percent and 60 percent, while for the rest of America the figure is probably closer to 20 percent, so an overall elite-campus UC Asian-American enrollment of around 40 percent seems reasonably close to what a fully meritocratic admissions system might be expected to produce.

By contrast, consider the anomalous admissions statistics for Columbia. New York City contains America's largest urban Asian population, and Asians are one-third or more of the entire state's top scoring high school students. Over the last couple of decades, the local Asian population has doubled in size and Asians now constitute over two-thirds of the students attending the most selective local high schools such as Stuyvesant and Bronx Science, perhaps triple the levels during the mid-1980s.[40] Yet whereas in 1993 Asians made up

22.7 percent of Columbia's undergraduates, the total had dropped to 15.6 percent by 2011. These figures seem extremely difficult to explain except as evidence of sharp racial bias.

## Asian-Americans and Jews

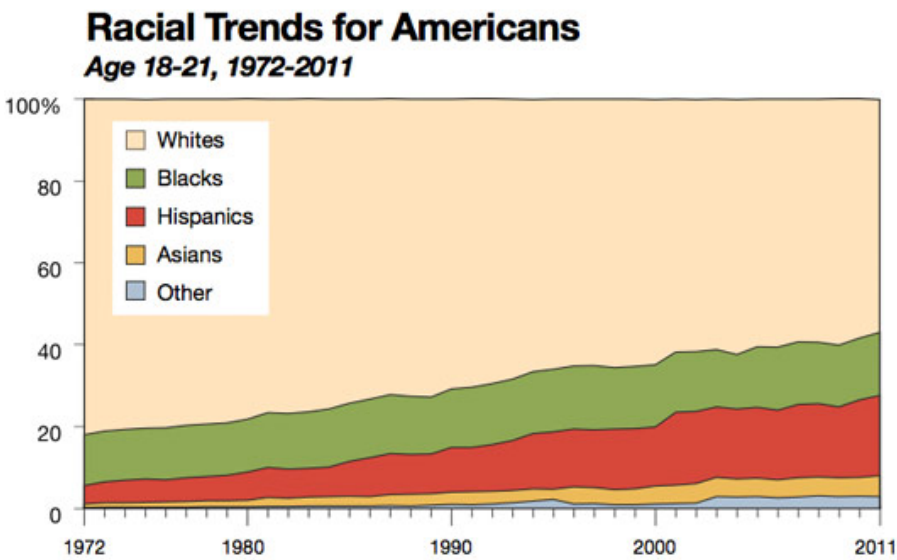
A natural question to consider is the surprising lack of attention this issue seems to have attracted, despite such remarkably telling statistics and several articles over the years in major newspapers by Golden and other prominent journalists. One would think that a widespread practice of racial discrimination by America's most elite private universities—themselves leading bastions of "Political Correctness" and strident anti-racist ideology—would attract much more public scrutiny, especially given their long prior history of very similar exclusionary policies with regard to Jewish enrollment.[41] Without such scrutiny and the political mobilization it generates, the *status quo* seems unlikely to change.[42]

Indeed, Karabel convincingly demonstrates that the collapse of the long-standing Jewish quotas in the Ivy League during the decade following World War II only occurred as a result of massive media and political pressure, pressure surely facilitated by very heavy Jewish ownership of America's major media organs, including all three television networks, eight of nine major Hollywood studios, and many of the leading newspapers, including both the *New York Times* and the *Washington Post*. By contrast, Asian-Americans today neither own nor control even a single significant media outlet, and they constitute an almost invisible minority in films, television, radio, and print. For most Americans, what the media does not report simply does not exist, and there is virtually no major media coverage of what appear to be *de facto* Asian quotas at our top academic institutions.

But before we conclude that our elite media organs are engaging in an enormous "conspiracy of silence" regarding this egregious pattern of racial discrimination at our most prestigious universities, we should explore alternate explanations for these striking results. Perhaps we are considering the evidence from entirely the wrong perspective, and ignoring the most obvious—and relatively innocuous—explanation.

In recent decades, the notion of basing admissions on "colorblind" meritocratic standards such as standardized academic test scores has hardly been an uncontroversial position, with advocates for a fully "diversified" student body being far more prominent within the academic community. Indeed, one of the main attacks against

California's 1996 Proposition 209 was that its requirement of race-neutrality in admissions would destroy the ethnic diversity of California's higher education system, and the measure was vigorously opposed by the vast majority of vocal university academics, both within that state and throughout the nation. Most leading progressives have long argued that the students selected by our elite institutions should at least roughly approximate the distribution of America's national population, requiring that special consideration be given to underrepresented or underprivileged groups of all types.



We must remember that at all the universities discussed above, Asian students are already enrolled in numbers far above their 5 percent share of the national population, and the Iron Law of Arithmetic is that percentages must always total to one hundred. So if additional slots were allocated to Asian applicants, these must necessarily come from some other group, perhaps blacks raised in the ghettos of Detroit or desperately poor Appalachian whites, who might be the first in their families to attend college. These days in America, most Asians are a heavily urbanized, highly affluent population,[43] overwhelmingly part of the middle- or upper-middle class, and boosting their Harvard numbers from three times their share of the population up to five or six might not be regarded as the best policy when other groups are far needier. To be sure, the broad racial category "Asian" hides enormous internal complexity—with Chinese, Koreans, and South Asians being far more successful than Filipinos, Vietnamese, or Cambodians—but that is just as true of the equally broad "white" or "Hispanic" labels, which also conceal

much more than they reveal.

Furthermore, elite universities explicitly claim to consider a wide range of other admissions factors besides academic performance. Geographical diversity would certainly hurt Asian chances since nearly half their population lives in just the three states of California, New York, and Texas.[44] Top athletes gain a strong admissions edge, and few Asians are found in the upper ranks of basketball, football, baseball, and other leading sports, an occasional Jeremy Lin notwithstanding. Since most Asians come from a recent immigrant background, they would rarely receive the "legacy boost" going to students whose families have been attending the Ivy League for generations. And it is perfectly possible that ideological considerations of diversity and equity might make administrators reluctant to allow any particular group to become too heavily over-represented relative to its share of the general population. So perhaps highly-qualified Asians are not being rejected as Asians, but simply due to these pre-existing ideological and structural policies of our top universities, whether or not we happen to agree with them.[45] In fact, when an Asian student rejected by Harvard filed a complaint of racial discrimination with the U.S. Department of Education earlier this year, the Harvard *Crimson* denounced his charges as "ludicrous," arguing that student diversity was a crucial educational goal and that affirmative action impacted Asians no more than any other applicant group.[46]

The best means of testing this hypothesis would be to compare Asian admissions with those of a somewhat similar control group. One obvious candidate would be the population of elite East Coast WASPs which once dominated the Ivy League. Members of this group should also be negatively impacted by admissions preferences directed towards applicants from rural or impoverished backgrounds, but there seems considerable anecdotal evidence that they are still heavily over-represented in the Ivy League relative to their academic performance or athletic prowess, strengthening the suspicion that Asian applicants are receiving unfair treatment. However, solid statistical data regarding this elite WASP subpopulation is almost non-existent, and anyway the boundaries of the category are quite imprecise and fluid across generations. For example, the two wealthy Winklevoss twins of Greenwich, Conn. and Harvard Facebook fame might appear to be perfect examples of this social class, but their grandfather actually had an eighth-grade education and came from a long line of impoverished coalminers in rural Pennsylvania.[47]

Fortunately, an alternate comparison population is readily available,

namely that of American Jews,[48] a group which is both reasonably well-defined and one which possesses excellent statistical information, gathered by various Jewish organizations and academic scholars. In particular, Hillel, the nationwide Jewish student organization with chapters on most major university campuses, has for decades been providing extensive data on Jewish enrollment levels. Since Karabel's own historical analysis focuses so very heavily on Jewish admissions, his book also serves as a compendium of useful quantitative data drawn from these and similar sources.[49]

Once we begin separating out the Jewish portion of Ivy League enrollment, our picture of the overall demographics of the student bodies is completely transformed. Indeed, Karabel opens the final chapter of his book by performing exactly this calculation and noting the extreme irony that the WASP demographic group which had once so completely dominated America's elite universities and "virtually all the major institutions of American life" had by 2000 become "a small and beleaguered minority at Harvard," being actually fewer in number than the Jews whose presence they had once sought to restrict.[50] Very similar results seem to apply all across the Ivy League, with the disproportion often being even greater than the particular example emphasized by Karabel.

In fact, Harvard reported that 45.0 percent of its undergraduates in 2011 were white Americans, but since Jews were 25 percent of the student body, the enrollment of non-Jewish whites might have been as low as 20 percent, though the true figure was probably somewhat higher.[51] The Jewish levels for Yale and Columbia were also around 25 percent, while white Gentiles were 22 percent at the former and just 15 percent at the latter. The remainder of the Ivy League followed this same general pattern.

This overrepresentation of Jews is really quite extraordinary, since the group currently constitutes just 2.1 percent of the general population and about 1.8 percent of college-age Americans.[52] Thus, although Asian-American high school graduates each year outnumber their Jewish classmates nearly three-to-one, American Jews are far more numerous at Harvard and throughout the Ivy League. Both groups are highly urbanized, generally affluent, and geographically concentrated within a few states, so the "diversity" factors considered above would hardly seem to apply; yet Jews seem to fare much better at the admissions office.

Even more remarkable are the historical trajectories. As noted earlier, America's Asian population has been growing rapidly over the last

couple of decades, so the substantial decline in reported Ivy League Asian enrollment has actually constituted a huge drop relative to their fraction of the population. Meanwhile, the population of American Jews has been approximately constant in numbers, and aging along with the rest of the white population, leading to a sharp decline in the national proportion of college-age Jews, falling from 2.6 percent in 1972 and 2.2 percent in 1992 to just 1.8 percent in 2012. Nevertheless, total Jewish enrollment at elite universities has held constant or actually increased, indicating a large rise in relative Jewish admissions. In fact, if we aggregate the reported enrollment figures, we discover that 4 percent of all college-age American Jews are currently enrolled in the Ivy League, compared to just 1 percent of Asians and about 0.1 percent of whites of Christian background.[53]

One reasonable explanation for these remarkable statistics might be that although Asian-Americans are a high-performing academic group, American Jews may be far higher-performing, perhaps not unlikely for an ethnicity that gave the world Einstein, Freud, and so many other prominent intellectual figures. Thus, if we assume that our elite universities reserve a portion of their slots for "diversity" while allocating the remainder based on "academic merit," Jews might be handily beating Asians (and everyone else) in the latter competition. Indeed, the average Jewish IQ has been widely reported in the range of 110–115, implying a huge abundance of individuals at the upper reaches of the distribution of intellect. So perhaps what had seemed like a clear pattern of anti-Asian discrimination is actually just the workings of academic meritocracy, at least when combined with a fixed allocation of "diversity admissions."

The easiest means of exploring this hypothesis is to repeat much of our earlier examination of Asian academic performance, but now to include Jews as part of our analysis. Although Jewish names are not quite as absolutely distinctive as East or South Asian ones, they can be determined with reasonably good accuracy, so long as we are careful to note ambiguous cases and recognize that our estimates may easily be off by a small amount; furthermore, we can utilize especially distinctive names as a validation check. But strangely enough, when we perform this sort of analysis, it becomes somewhat difficult to locate major current evidence of the celebrated Jewish intellect and academic achievement discussed at such considerable length by Karabel and many other authors.

For example, consider California, second only to New York in the total number of its Jews, and with its Jewish percentage far above the national average. Over the last couple of years, blogger Steve Sailer

and some of his commenters have examined the complete 2010 and 2012 NMS semifinalist lists of the 2000 or so top-scoring California high school seniors for ethnicity, and discovered that as few as 4–5 percent of the names seem to be Jewish, a figure not so dramatically different than the state's 3.3 percent Jewish population, and an estimate which I have personally confirmed.[54] Meanwhile, the state's 13 percent Asians account for over 57 percent of the top performing students. Thus, it appears that California Asians are perhaps three times as likely as Jews to do extremely well on academic tests, and this result remains unchanged if we adjust for the age distributions of the two populations.

One means of corroborating these surprising results is to consider the ratios of particularly distinctive ethnic names, and Sailer reported such exact findings made by one of his Jewish readers. For example, across the 2000-odd top scoring California students in 2010, there was just a single NMS semifinalist named Cohen, and also one each for Levy, Kaplan, and a last name beginning with "Gold." Meanwhile, there were 49 Wangs and 36 Kims, plus a vast number of other highly distinctive Asian names. But according to Census data, the combined number of American Cohens and Levys together outnumber the Wangs almost two-to-one, and the same is true for the four most common names beginning with "Gold." Put another way, California contains nearly one-fifth of all American Jews, hence almost 60,000 Cohens, Kaplans, Levys, Goldens, Goldsteins, Goldbergs, Goldmans, and Golds, and this population produced only 4 NMS semifinalists, a ratio almost identical to that produced by our general last name estimates. The 2012 California NMS semifinalist lists yield approximately the same ratios.

When we consider the apparent number of Jewish students across the NMS semifinalist lists of other major states, we get roughly similar results. New York has always been the center of the American Jewish community, and at 8.4 percent is half again as heavily Jewish as any other state, while probably containing a large fraction of America's Jewish financial and intellectual elite. Just as we might expect, the 2011 roster of New York NMS semifinalists is disproportionately filled with Jewish names, constituting about 21 percent of the total, a ratio twice as high as for any other state whose figures are available. But even here, New York's smaller and much less affluent Asian population is far better represented, providing around 34 percent of the top scoring students. Jews and Asians are today about equal in number within New York City but whereas a generation ago, elite local public schools such as Stuyvesant were very heavily Jewish, today Jews are outnumbered at least several times over by Asians.[55]

This same pattern of relative Asian and Jewish performance on aptitude exams generally appears in the other major states whose recent NMS semifinalist lists I have located and examined, though there is considerable individual variability, presumably due to the particular local characteristics of the Asian and Jewish populations. Across six years of Florida results, Asian students are more than twice as likely to be high scorers compared to their Jewish classmates, with the disparity being nearly as great in Pennsylvania. The relative advantage of Asians is a huge factor of 5.0 in Michigan and 4.1 in Ohio, while in Illinois Asians still do 150 percent as well as Jews. Among our largest states, only in Texas is the Asian performance as low as 120 percent, although Jews are the group that actually does much better in several smaller states, usually those in which the Jewish population is tiny.

As noted earlier, NMS semifinalist lists are available for a total of twenty-five states, including the eight largest, which together contain 75 percent of our national population, as well as 81 percent of American Jews and 80 percent of Asian-Americans, and across this total population Asians are almost twice as likely to be top scoring students as Jews. Extrapolating these results to the nation as a whole would produce a similar ratio, especially when we consider that Asian-rich California has among the toughest NMS semifinalist qualification thresholds. Meanwhile, the national number of Jewish semifinalists comes out at less than 6 percent of the total based on direct inspection of the individual names, with estimates based on either the particularly distinctive names considered by Sailer or the full set of such highly distinctive names used by Weyl yielding entirely consistent figures. Weyl had also found this same relative pattern of high Jewish academic performance being greatly exceeded by even higher Asian performance, with Koreans and Chinese being three or four times as likely as Jews to reach NMS semifinalist status in the late 1980s, though the overall Asian numbers were still quite small at the time.[56]

Earlier we had noted that the tests used to select NMS semifinalists actually tilted substantially against Asian students by double-weighting verbal skills and excluding visuospatial ability, but in the case of Jews this same testing-bias has exactly the opposite impact. Jewish ability tends to be exceptionally strong in its verbal component and mediocre at best in the visuospatial,[57] so the NMS semifinalist selection methodology would seem ideally designed to absolutely maximize the number of high-scoring Jews compared to other whites or (especially) East Asians. Thus, the number of high-ability Jews we are finding should be regarded as an extreme upper bound to a more

neutrally-derived total.

But suppose these estimates are correct, and Asians overall are indeed twice as likely as Jews to rank among America's highest performing students. We must also consider that America's Asian population is far larger in size, representing roughly 5 percent of college-age students, compared to just 1.8 percent for Jews. Therefore, assuming an admissions system based on strictest objective meritocracy, we would expect our elite academic institutions to contain nearly five Asians for every Jew; but instead, the Jews are far more numerous, in some important cases by almost a factor of two. This raises obvious suspicions about the fairness of the Ivy League admissions process.

Once again, we can turn to the enrollment figures for strictly meritocratic Caltech as a test of our estimates. The campus is located in the Los Angeles area, home to one of America's largest and most successful Jewish communities, and Jews have traditionally been strongly drawn to the natural sciences. Indeed, at least three of Caltech's last six presidents have been of Jewish origin, and the same is true for two of its most renowned faculty members, theoretical physics Nobel Laureates Richard Feynman and Murray Gell-Mann. But Caltech's current undergraduates are just 5.5 percent Jewish, and the figure seems to have been around this level for some years; meanwhile, Asian enrollment is 39 percent, or seven times larger. It is intriguing that the school which admits students based on the strictest, most objective academic standards has by a very wide margin the lowest Jewish enrollment for any elite university.

Let us next turn to the five most selective campuses of the University of California system, whose admissions standards shifted substantially toward objective meritocracy following the 1996 passage of Prop. 209. The average Jewish enrollment is just over 8 percent, or roughly one-third that of the 25 percent found at Harvard and most of the Ivy League, whose admissions standards are supposedly far tougher. Meanwhile, some 40 percent of the students on these UC campuses are Asian, a figure almost five times as high. Once again, almost no elite university in the country has a Jewish enrollment as low as the average for these highly selective UC campuses.[58]

Another interesting example is MIT, whose students probably rank fifth in academic strength, just below the three HYP schools and Caltech, and whose admissions standards are far closer to a meritocratic ideal than is found in most elite schools, though perhaps not quite as pristine as those of its Caltech rival. Karabel notes that MIT has always had a far more meritocratic admissions system than

nearby Harvard, tending to draw those students who were academic stars even if socially undistinguished. As an example, in the 1930s Feynman had been rejected by his top choice of Columbia possibly due to its Jewish quota, and instead enrolled at MIT.[59] But today, MIT's enrollment is just 9 percent Jewish, a figure lower than that anywhere in the Ivy League, while Asians are nearly three times as numerous, despite the school being located in one of the most heavily Jewish parts of the country.

## The Strange Collapse of Jewish Academic Achievement

From my own perspective, I found these statistical results surprising, even shocking.

I had always been well aware of the very heavy Jewish presence at elite academic institutions. But the underwhelming percentage of Jewish students who today achieve high scores on academic aptitude tests was totally unexpected, and very different from the impressions I had formed during my own high school and college years a generation or so ago. An examination of other available statistics sees to support my recollections and provides evidence for a dramatic recent decline in the academic performance of American Jews

The U.S. Math Olympiad began in 1974, and all the names of the top scoring students are easily available on the Internet. During the 1970s, well over 40 percent of the total were Jewish, and during the 1980s and 1990s, the fraction averaged about one-third. However, during the thirteen years since 2000, just two names out of 78 or 2.5 percent appear to be Jewish. The Putnam Exam is the most difficult and prestigious mathematics competition for American college students, with five or six Putnam winners having been selected each year since 1938. Over 40 percent of the Putnam winners prior to 1950 were Jewish, and during every decade from the 1950s through the 1990s, between 22 percent and 31 percent of the winners seem to have come from that same ethnic background. But since 2000, the percentage has dropped to under 10 percent, without a single likely Jewish name in the last seven years.

This consistent picture of stark ethnic decline recurs when we examine the statistics for the Science Talent Search, which has been selecting 40 students as national finalists for America's most prestigious high school science award since 1942, thus providing a huge statistical dataset of over 2800 top science students. During every decade from

the 1950s through the 1980s, Jewish students were consistently 22–23 percent of the recipients, with the percentage then declining to 17 percent in the 1990s, 15 percent in the 2000s, and just 7 percent since 2010. Indeed, of the thirty top ranked students over the last three years, only a single one seems likely to have been Jewish. Similarly, Jews were over one-quarter of the top students in the Physics Olympiad from 1986 to 1997, but have fallen to just 5 percent over the last decade, a result which must surely send Richard Feynman spinning in his grave.

…

Other science competitions provide generally consistent recent results, though without the long track record allowing useful historical comparisons. Over the last dozen years, just 8 percent of the top students in the Biology Olympiad have been Jewish, with none in the last three years. Between 1992 and 2012, only 11 percent of the winners of the Computing Olympiad had Jewish names, as did just 8 percent of the Siemens AP Award winners. And although I have only managed to locate the last two years of Chemistry Olympiad winners, these lists of 40 top students contained not a single probable Jewish name.

Further evidence is supplied by Weyl, who estimated that over 8 percent of the 1987 NMS semifinalists were Jewish,[60] a figure 35 percent higher than found in today's results. Moreover, in that period the math and verbal scores were weighted equally for qualification purposes, but after 1997 the verbal score was double-weighted,[61] which should have produced a large rise in the number of Jewish semifinalists, given the verbal-loading of Jewish ability. But instead, today's Jewish numbers are far below those of the late 1980s.

Taken in combination, these trends all provide powerful evidence that over the last decade or more there has been a dramatic collapse in Jewish academic achievement, at least at the high end.

Several possible explanations for this empirical result seem reasonably plausible. Although the innate potential of a group is unlikely to drop so suddenly, achievement is a function of both ability and effort, and today's overwhelmingly affluent Jewish students may be far less diligent in their work habits or driven in their studies than were their parents or grandparents, who lived much closer to the bracing challenges of the immigrant experience. In support of this hypothesis, roughly half of the Jewish Math Olympiad winners from the last two decades have had the sort of highly distinctive names which would

tend to mark them as recent immigrants from the Soviet Union or elsewhere, and such names were also very common among the top Jewish science students of the same period, even though this group represents only about 10 percent of current American Jews. Indeed, it seems quite possible that this large sudden influx of very high performing immigrant Jews from the late 1980s onward served to partially mask the rapid concurrent decline of high academic achievement among native American Jews, which otherwise would have become much more clearly evident a decade or so earlier.

This pattern of third or fourth generation American students lacking the academic drive or intensity of their forefathers is hardly surprising, nor unique to Jews. Consider the case of Japanese-Americans, who mostly arrived in America during roughly the same era. America's Japanese have always been a high-performing group, with a strong academic tradition, and Japan's international PISA academic scores are today among the highest in the world. But when we examine the list of California's NMS semifinalists, less than 1 percent of the names are Japanese, roughly in line with their share of the California population.[62] Meanwhile, Chinese, Koreans, and South Asians are 6 percent of California but contribute 50 percent of the top scoring students, an eight-fold better result, with a major likely difference being that they are overwhelmingly of recent immigrant origin. In fact, although ongoing Japanese immigration has been trivial in size, a significant fraction of the top Japanese students have the unassimilated Japanese first names that would tend to indicate they are probably drawn from that tiny group.

In his 1966 book *The Creative Elite in America*, Weyl used last name analysis to document a similarly remarkable collapse in achievement among America's Puritan-descended population, which had once provided a hugely disproportionate fraction of our intellectual leadership, but for various reasons went into rapid decline from about 1900 onward. He also mentions the disappearance of the remarkable Scottish intellectual contribution to British life after about 1800. Although the evidence for both these historical parallels seems very strong, the causal factors are not entirely clear, though Weyl does provide some possible explanations.[63]

In some respects, perhaps it was the enormously outsize Jewish academic performance of the past which was highly anomalous, and the more recent partial convergence toward white European norms which is somewhat less surprising. Over the years, claims have been widely circulated that the mean Jewish IQ is a full standard deviation —15 points—above the white average of 100,[64] but this seems to

have little basis in reality. Richard Lynn, one of the world's foremost IQ experts, has performed an exhaustive literature review and located some 32 IQ samples of American Jews, taken from 1920 to 2008. For the first 14 studies conducted during the years 1920–1937, the Jewish IQ came out very close to the white American mean, and it was only in later decades that the average figure rose to the approximate range of 107–111.[65]

In a previous article "Race, IQ & Wealth," I had suggested that the IQs of ethnic groups appear to be far more malleable than many people would acknowledge, and may be particularly influenced by factors of urbanization, education, and affluence.[66] Given that Jews have always been America's most heavily urbanized population and became the most affluent during the decades in question, these factors may account for a substantial portion of their huge IQ rise during most of the twentieth century. But with modern electronic technology recently narrowing the gaps in social environment and educational opportunities between America's rural and urban worlds, we might expect a portion of this difference to gradually dissipate. American Jews are certainly a high-ability population, but the innate advantage they have over other high-ability white populations is probably far smaller than is widely believed.

This conclusion is supported by the General Social Survey (GSS), an online dataset of tens of thousands of American survey responses from the last forty years which includes the Wordsum vocabulary test, a very useful IQ proxy correlating at 0.71. Converted into the corresponding IQ scores, the Wordsum-IQ of Jews is indeed quite high at 109. But Americans of English, Welsh, Scottish, Swedish, and Catholic Irish ancestry also have fairly high mean IQs of 104 or above, and their combined populations outnumber Jews by almost 15-to-1, implying that they would totally dominate the upper reaches of the white American ability distribution, even if we excluded the remaining two-thirds of all American whites, many of whose IQs are also fairly high. Furthermore, all these groups are far less highly urbanized or affluent than Jews,[67] probably indicating that their scores are still artificially depressed to some extent. We should also remember that Jewish intellectual performance tends to be quite skewed, being exceptionally strong in the verbal subcomponent, much lower in math, and completely mediocre in visuospatial ability; thus, a completely verbal-oriented test such as Wordsum would actually tend to exaggerate Jewish IQ.

Stratifying the white American population along religious lines produces similar conclusions. An analysis of the data from the

National Longitudinal Survey of Youth found that Americans raised in the Episcopal Church actually exceeded Jews in mean IQ, while several other religious categories came quite close, leading to the result that the overwhelming majority of America's high-ability white population had a non-Jewish background.[68]

Finally, in the case of Jews, these assimilation- or environment-related declines in relative academic performance may have been reinforced by powerful demographic trends. For the last generation or two, typical Jewish women from successful or even ordinary families have married very late and averaged little more than a single child, while the small fraction of Jewish women who are ultra-Orthodox often marry in their teens and then produce seven or eight children.[69] As a consequence, this extremely religious subpopulation has been doubling in size every twenty years, and now easily exceeds 10 percent of the total, including a far higher percentage of younger Jews. But ultra-Orthodox Jews have generally been academically mediocre, often with enormously high rates of poverty and government dependency.[70] Therefore, the combination of these two radically different trends of Jewish reproduction has acted to stabilize the total number of Jewish youngsters, while probably producing a sharp drop in their average academic achievement.

## Meritocracy vs. Jews

Although the relative importance of these individual factors behind Jewish academic decline is unclear, the decline itself seems an unmistakable empirical fact, and the widespread unawareness of this fact has had important social consequences.

My casual mental image of today's top American students is based upon my memories of a generation or so ago, when Jewish students, sometimes including myself, regularly took home a quarter or more of the highest national honors on standardized tests or in prestigious academic competitions; thus, it seemed perfectly reasonable that Harvard and most of the other Ivy League schools might be 25 percent Jewish, based on meritocracy. But the objective evidence indicates that in present day America, only about 6 percent of our top students are Jewish, which now renders such very high Jewish enrollments at elite universities totally absurd and ridiculous. I strongly suspect that a similar time lag effect is responsible for the apparent confusion in many others who have considered the topic.

For example, throughout his very detailed book, Karabel always seems

to automatically identify increasing Jewish enrollments with academic meritocracy, and Jewish declines with bias or discrimination, retaining this assumption even when his discussion moves into the 1990s and 2000s. He was born in 1950, graduated Harvard in 1972, and returned there to earn his Ph.D. in 1977, so this may indeed have been the reality during his formative years.[71] But he seems strikingly unaware that the world has changed since then, and that over the last decade or two, meritocracy and Jewish numbers have become opposing forces: the stricter the meritocratic standard, the fewer the Jews admitted.

Most of my preceding analysis has focused on the comparison of Asians with Jews, and I have pointed out that based on factors of objective academic performance and population size, we would expect Asians to outnumber Jews by perhaps five to one at our top national universities; instead, the total Jewish numbers across the Ivy League are actually 40 percent higher. This implies that Jewish enrollment is roughly 600 percent greater relative to Asians than should be expected under a strictly meritocratic admissions system.

Obviously, all these types of analysis may be applied just as easily to a comparison of Jews with non-Jewish whites, and the results turn out to be equally striking. The key factor is that although Jewish academic achievement has apparently plummeted in recent decades, non-Jewish whites seem to have remained relatively unchanged in their performance, which might be expected in such a large and diverse population. As a consequence, the relative proportions of top-performing students have undergone a dramatic shift.

We must bear in mind that the official U.S. Census category of "Non-Hispanic white" (which I will henceforth label "white") is something of an ethnic hodgepodge, encompassing all the various white European ancestry groups, as well as a substantial admixture of North Africans, Middle Easterners, Iranians, Turks, Armenians, and Afghans. It amounts to everyone who is not black, Hispanic, Asian, or American Indian, and currently includes an estimated 63 percent of all Americans.

Determining the number of whites among NMS semifinalists or winners of various academic competitions is relatively easy. Both Asian and Hispanic names are quite distinctive, and their numbers can be estimated by the methods already discussed. Meanwhile, blacks are substantially outnumbered by Hispanics and they have much weaker academic performance, so they would produce far fewer very high scoring students. Therefore, we can approximate the number of whites

by merely subtracting the number of Asian and Hispanic names as well as an estimated black total based on the latter figure, and then determine the number of white Gentiles by also subtracting the Jewish total.

Once we do this and compare the Jewish and non-Jewish white totals for various lists of top academic performers, we notice a striking pattern, with the historical ratios once ranging from near-equality to about one-in-four up until the recent collapse in Jewish performance. For example, among Math Olympiad winners, white Gentiles scarcely outnumbered Jews during the 1970s, and held only a three-to-two edge during the 1980s and 1990s, but since 2000 have become over fifteen times as numerous. Between 1938 and 1999, Putnam Exam winners had averaged about two white Gentiles for every Jew, with the ratios for each decade oscillating between 1.5 and 3.0, then rising to nearly 5-to-1 during 2001–2005, and without a single Jewish name on the winner list from 2006 onward.

The elite science competitions follow a broadly similar pattern. Non-Jewish whites had only outnumbered Jews 2-to-1 among the Physics Olympiad winners during 1986–1997, but the ratio rose to at least 7-to-1 during 2002–2012. Meanwhile, white Gentiles were more numerous by nearly 6-to-1 among 1992–2012 Computing Olympiad winners, 4-to-1 among the 2002–2011 Siemens AP Award winners, and over 3-to-1 among 2003–2012 Biology Olympiad champions. Across the sixty-odd years of America's Science Talent Search, Jews had regularly been named finalists at a relative rate fifteen- or even twenty-times that of their white Gentile classmates, but over the last decade or so, this has dropped by half.

The evidence of the recent NMS semifinalist lists seems the most conclusive of all, given the huge statistical sample sizes involved. As discussed earlier, these students constitute roughly the highest 0.5 percent in academic ability, the top 16,000 high school seniors who should be enrolling at the Ivy League and America's other most elite academic universities. In California, white Gentile names outnumber Jewish ones by over 8-to-1; in Texas, over 20-to-1; in Florida and Illinois, around 9-to-1. Even in New York, America's most heavily Jewish state, there are more than two high-ability white Gentile students for every Jewish one. Based on the overall distribution of America's population, it appears that approximately 65–70 percent of America's highest ability students are non-Jewish whites, well over ten times the Jewish total of under 6 percent.

Source: Appendices C-F

Needless to say, these proportions are considerably different from what we actually find among the admitted students at Harvard and its elite peers, which today serve as a direct funnel to the commanding heights of American academics, law, business, and finance. Based on reported statistics, Jews approximately match or even outnumber non-Jewish whites at Harvard and most of the other Ivy League schools, which seems wildly disproportionate. Indeed, the official statistics indicate that non-Jewish whites at Harvard are America's most under-represented population group, enrolled at a much lower fraction of their national population than blacks or Hispanics, despite having far higher academic test scores.

When examining statistical evidence, the proper aggregation of data is critical. Consider the ratio of the recent 2007–2011 enrollment of Asian students at Harvard relative to their estimated share of America's recent NMS semifinalists, a reasonable proxy for the high-ability college-age population, and compare this result to the corresponding figure for whites. The Asian ratio is 63 percent, slightly above the white ratio of 61 percent, with both these figures being considerably below parity due to the substantial presence of under-represented racial minorities such as blacks and Hispanics, foreign students, and students of unreported race. Thus, there appears to be no evidence for racial bias against Asians, even excluding the race-neutral impact of athletic recruitment, legacy admissions, and geographical diversity.

However, if we separate out the Jewish students, their ratio turns out to be 435 percent, while the residual ratio for non-Jewish whites drops to just 28 percent, less than half of even the Asian figure. As a consequence, Asians appear under-represented relative to Jews by a factor of seven, while non-Jewish whites are by far the most under-represented group of all, despite any benefits they might receive from athletic, legacy, or geographical distribution factors. The rest of the Ivy League tends to follow a similar pattern, with the overall Jewish ratio being 381 percent, the Asian figure at 62 percent, and the ratio for non-Jewish whites a low 35 percent, all relative to their number of high-ability college-age students.

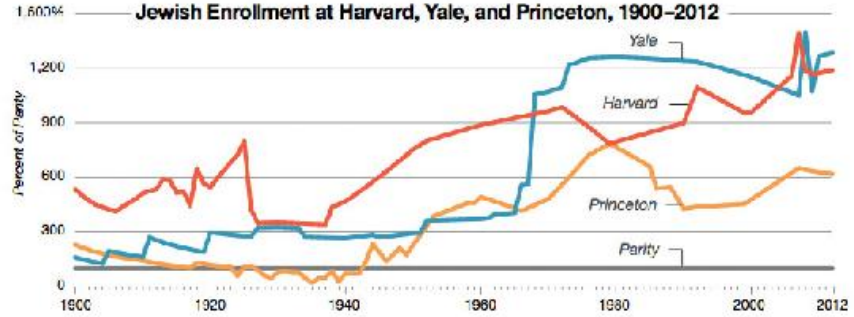
Just as striking as these wildly disproportionate current numbers have been the longer enrollment trends. In the three decades since I graduated Harvard, the presence of white Gentiles has dropped by as much as 70 percent, despite no remotely comparable decline in the relative size or academic performance of that population; meanwhile, the percentage of Jewish students has actually increased. This period certainly saw a very rapid rise in the number of Asian, Hispanic, and foreign students, as well as some increase in blacks. But it seems rather odd that all of these other gains would have come at the expense of whites of Christian background, and none at the expense of Jews.

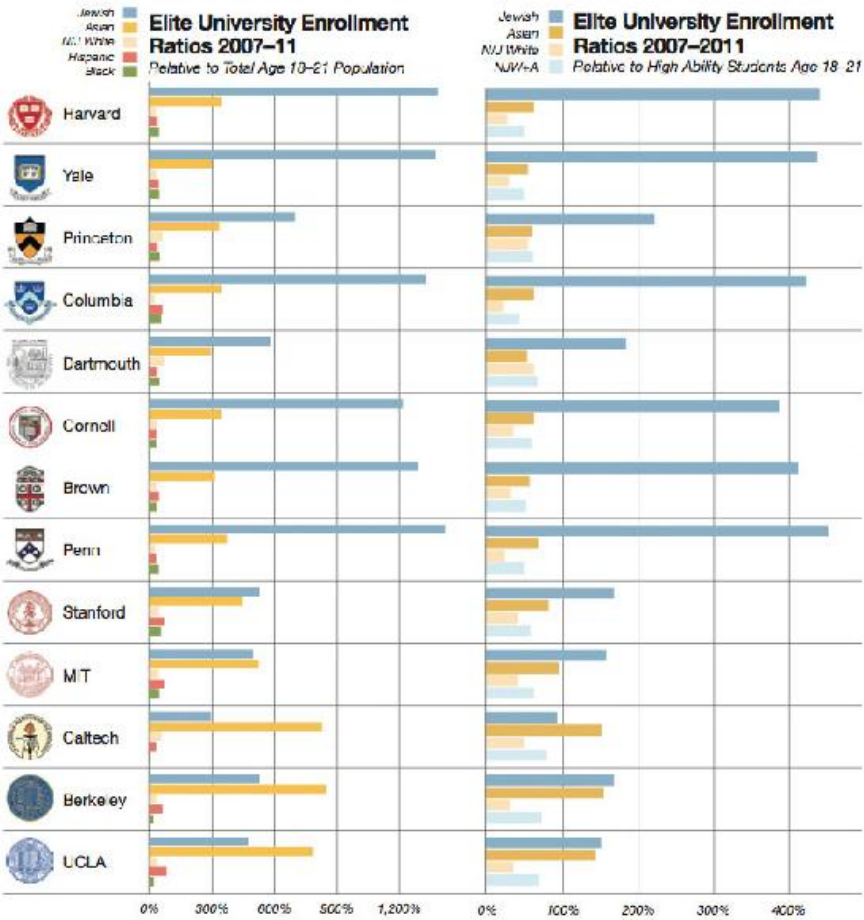
Furthermore, the Harvard enrollment changes over the last decade have been even more unusual when we compare them to changes in the underlying demographics. Between 2000 and 2011, the relative percentage of college-age blacks enrolled at Harvard dropped by 18 percent, along with declines of 13 percent for Asians and 11 percent for Hispanics, while only whites increased, expanding their relative enrollment by 16 percent. However, this is merely an optical illusion:

in fact, the figure for non-Jewish whites slightly declined, while the relative enrollment of Jews increased by over 35 percent, probably reaching the highest level in Harvard's entire history. Thus, the relative presence of Jews rose sharply while that of all other groups declined, and this occurred during exactly the period when the once-remarkable academic performance of Jewish high school students seemed to suddenly collapse.

Most of the other Ivy League schools appear to follow a fairly similar trajectory. Between 1980 and 2011, the official figures indicate that non-Jewish white enrollment dropped by 63 percent at Yale, 44 percent at Princeton, 52 percent at Dartmouth, 69 percent at Columbia, 62 percent at Cornell, 66 percent at Penn, and 64 percent at Brown. If we confine our attention to the last decade or so, the relative proportion of college-age non-Jewish whites enrolled at Yale has dropped 23 percent since 2000, with drops of 28 percent at Princeton, 18 percent at Dartmouth, 19 percent at Columbia and Penn, 24 percent at Cornell, and 23 percent at Brown. For most of these universities, non-white groups have followed a mixed pattern, mostly increasing but with some substantial drops. I have only located yearly Jewish enrollment percentages back to 2006, but during the six years since then, there is a uniform pattern of often substantial rises: increases of roughly 25 percent at Yale, 45 percent at Columbia, 10 percent at Cornell, 15 percent at Brown, and no declines anywhere.

Fourteen years ago I published a widely-discussed column in the *Wall Street Journal* highlighting some of the absurdities of our affirmative action system in higher education.[72] In particular, I pointed out that although Jews and Asians then totaled merely 5 percent of the American population, they occupied nearly 50 percent of the slots at Harvard and most of the other elite Ivies, while non-Jewish whites were left as the most under-represented student population, with relative numbers below those of blacks or Hispanics. Since then Jewish academic achievement has seemingly collapsed but relative Jewish enrollment in the Ivies has generally risen, while the exact opposite combination has occurred for both Asians and non-Jewish whites. I find this a strange and unexpected development.





*Note that the ethnic enrollment ratios for Berkeley and UCLA are based on the national demographics, but their students are primarily drawn from within California, whose racial distribution is very different: the white student population is half the national average, while Asians and Hispanics are more numerous by a factor of two, implying different parity rates. The underlying data for these charts is drawn from Appendix H.*

It is important to recognize that all of these enrollment statistics are far less precise than we might ideally desire. As mentioned earlier,

over the last couple of decades widespread perceptions of racial bias in admissions have led a significant number of students to refuse to reveal their race, which the official statistics classify as "race unknown." This group almost certainly consists of Asians and whites, but it is impossible for us to determine the relative proportions, and without this information our above estimates can only be approximate.

Similarly, nearly all our figures on Jewish enrollment were ultimately drawn from the estimates of Hillel, the national Jewish campus organization, and these are obviously approximate. However, the Hillel data is the best we possess for recent decades, and is regularly used by the *New York Times* and other prominent media outlets, while also serving as the basis for much of Karabel's award-winning scholarship. Furthermore, so long as any latent bias in the data remained relatively constant, we could still correctly analyze changes over time.

For these sorts of reasons, any of the individual figures provided above should be treated with great caution, but the overall pattern of enrollments—statistics compiled over years and decades and across numerous different universities—seems likely to provide an accurate description of reality.

## Elite Colleges Look Neither Like America Nor Like America's Highest-Ability Students

We are therefore faced with the clear conundrum that Jewish students seem to constitute roughly 6 percent of America's highest-ability high school graduates and non-Jewish whites around 65–70 percent, but these relative ratios differ by perhaps 1000 percent from the enrollments we actually find at Harvard and the other academic institutions which select America's future elites. Meanwhile, an ethnic distribution much closer to this apparent ability-ratio is found at Caltech, whose admissions are purely meritocratic, unlike the completely opaque, subjective, and discretionary Ivy League system so effectively described by Karabel, Golden, and others.

One obvious explanatory factor is that the Ivy League is located in the Northeast, a region of the country in which the Jewish fraction of the population is more than twice the national average. However, these schools also constitute America's leading national universities, so their geographical intake is quite broad, with Harvard drawing less than 40 percent of its American students from its own region, and the others

similarly tending to have a nationally distributed enrollment. So this factor would probably explain only a small portion of the discrepancy. Furthermore, MIT utilizes a considerably more meritocratic and objective admissions system than Harvard, and although located just a few miles away has a ratio of Jewish to non-Jewish whites which differs by nearly a factor of four in favor of the latter compared to its crosstown rival.

By the late 1960s Jewish students had become a substantial fraction of most Ivy League schools and today some of their children may be benefiting from legacies. But until about twenty-five years ago, white Gentiles outnumbered their Jewish classmates perhaps as much as 3-to-1, so if anything we might expect the admissions impact of legacies to still favor the former group. Anyway, the research of Espenshade and his colleagues have shown that being a legacy provides an admissions advantage in the range of 19–26 percent,[73] while we are attempting to explain enrollment differences of roughly 1000 percent.

American Jews are certainly more affluent than most other groups, but all Ivy League universities admit their American students on a "need-blind" basis, so perceptions of ability to pay cannot be a factor, even if any evidence existed that Jewish applicants were actually wealthier than their non-Jewish counterparts. Many Jewish alumni are very generous to their alma maters, but so are non-Jews, and indeed nine of the ten largest university donations in history have come from non-Jewish individuals, nearly all in the last fifteen years;[74] thus, mercenary hopes of large future bequests would probably not be influencing these skewed admissions.

Perhaps Jews simply apply to these schools in far greater relative numbers, with successful, educationally-ambitious Jewish families being much more likely to encourage their bright children to aim at the Ivies than the parents of equally bright non-Jews. However, since these elite schools release no information regarding the ethnic or racial skew of their applications, we have no evidence for this hypothesis. And why would high-ability non-Jews be 600 percent or 800 percent more likely to apply to Caltech and MIT than to those other elite schools, which tend to have a far higher national profile?

Anyway, the numbers alone render this explanation implausible. Each year, the Ivy League colleges enroll almost 10,000 American whites and Asians, of whom over 3000 are Jewish. Meanwhile, each year the NMS Corporation selects and publicly names America's highest-ability 16,000 graduating seniors; of these, fewer than 1000 are Jewish, while almost 15,000 are non-Jewish whites and Asians. Even if every

single one of these high-ability Jewish students applied to and enrolled at the Ivy League—with none going to any of America's other 3000 colleges—Ivy League admissions officers are obviously still dipping rather deep into the lower reaches of the Jewish ability-pool, instead of easily drawing from some 15,000 other publicly identified candidates of far greater ability but different ethnicity. Why would these universities not simply send out inexpensive mailings to these 15,000 top students, encouraging them to apply, especially since their geographical, ethnic, and cultural backgrounds might help to considerably "diversify" undergraduate enrollments, while greatly raising the average student test scores by which these universities supposedly live or die in the competitive college-rankings.

The situation becomes even stranger when we focus on Harvard, which this year accepted fewer than 6 percent of over 34,000 applicants and whose offers of admission are seldom refused. Each Harvard class includes roughly 400 Jews and 800 Asians and non-Jewish whites; this total represents over 40 percent of America's highest-ability Jewish students, but merely 5 percent of their equally high-ability non-Jewish peers. It is quite possible that a larger percentage of these top Jewish students apply and decide to attend than similar members from these other groups, but it seems wildly implausible that such causes could account for roughly an eight-fold difference in apparent admissions outcome. Harvard's stated "holistic" admissions policy explicitly takes into account numerous personal characteristics other than straight academic ability, including sports and musical talent. But it seems very unlikely that any remotely neutral application of these principles could produce admissions results whose ethnic skew differs so widely from the underlying meritocratic ratios.

One datapoint strengthening this suspicion of admissions bias has been the plunge in the number of Harvard's entering National Merit Scholars, a particularly select ability group, which dropped by almost 40 percent between 2002 and 2011, falling from 396 to 248. This exact period saw a collapse in Jewish academic achievement combined with a sharp rise in Jewish Harvard admissions, which together might easily help to explain Harvard's strange decline in this important measure of highest student quality.

Harvard could obviously fill its entire class with high-scoring valedictorians or National Merit Scholars but chooses not to do so. In 2003, Harvard rejected well over half of all applicants with perfect SAT scores, up from rejecting a quarter a few years earlier, and in 2010 Princeton acknowledged it also admitted only about half.[75]

According to Harvard's dean of admissions, "With the SAT, small differences of 50 or 100 points or more have no significant effect on admissions decisions."[76] In fact, a former Senior Admissions Officer at Harvard has claimed that by the mid-2000s as few as 5 percent of the students at highly selective universities such as his own were admitted purely based on academic merit.[77]

It is important to note that these current rejection rates of top scoring applicants are vastly higher than during the 1950s or 1960s, when Harvard admitted six of every seven such students and Princeton adopted a 1959 policy in which no high scoring applicant could be refused admission without a detailed review by a faculty committee.[78] An obvious indication of Karabel's obtuseness is that he describes and condemns the anti-meritocratic policies of the past without apparently noticing that they have actually become far worse today. An admissions framework in which academic merit is not the prime consideration may be directly related to the mystery of why Harvard's ethnic skew differs in such extreme fashion from that of America's brightest graduating seniors. In fact, Harvard's apparent preference for academically weak Jewish applicants seems to be reflected in their performance once they arrive on campus.[79]

Having considered and largely eliminated these several possible explanatory factors, we can only speculate as to the true causes of such seemingly anomalous enrollment statistics at our Ivy League universities. However, we cannot completely exclude the possible explanation that these other top students are simply not wanted at such elite institutions, perhaps because their entrance in large numbers might drastically transform the current ethnic and cultural mix. After all, Karabel devoted hundreds of pages of his text to documenting exactly this pattern of Ivy League admissions behavior during the 1920s and 1930s, so why should we be surprised if it continues today, at least at an unconscious level, but simply with the polarities reversed?

It would be unreasonable to ignore the salient fact that this massive apparent bias in favor of far less-qualified Jewish applicants coincides with an equally massive ethnic skew at the topmost administrative ranks of the universities in question, a situation which once again exactly parallels Karabel's account from the 1920s. Indeed, Karabel points out that by 1993 Harvard, Yale, and Princeton all had presidents of Jewish ancestry,[80] and the same is true for the current presidents of Yale, Penn, Cornell, and possibly Columbia, as well as

Princeton's president throughout during the 1990s and Yale's new incoming president, while all three of Harvard's most recent presidents have either had Jewish origins or a Jewish spouse.[81]

At most universities, a provost is the second-ranking official, being responsible for day-to-day academic operations. Although Princeton's current president is not Jewish, all seven of the most recent Princeton provosts stretching back to 1977 have had such ancestry, with several of the other Ivies not being far behind.[82] A similar degree of massive overrepresentation is found throughout the other top administrative ranks of the rest of the Ivy League, and across American leading educational institutions in general, and these are the institutions which select our future national elites.

I have not the slightest reason to doubt that the overwhelming majority of these individuals are honest and sincere, and attempt to do their best for their institutions and their students. But as our liberal intellectual elites regularly emphasize, unconscious biases or shared assumptions can become a huge but unnoticed problem when decision-making occurs within a very narrow circle, whose extreme "non-diversity" may lead to lack of introspection, and what else can be said when for the last two decades almost all of the leaders of our most elite universities have been drawn from an ethnic community constituting just 2 percent of America's population?

As a perfect example of such a situation, consider an amusing incident from the mid-1980s, when Asian groups first noticed a sharp decline in Asian admissions rates to Harvard and accused the university of having begun a quiet effort to restrict Asian numbers, criticism which was vigorously resisted by senior Harvard officials. During this period, Henry Rosovsky, Harvard's Dean of the Faculty of Arts and Sciences (and later Acting President), referred to Asian American students as "no doubt the most over-represented group in the university."[83] At that point, Harvard's Asian students were enrolled at 300 percent of parity, while those of Rosovsky's own ethnicity were probably at 900 percent or more of parity.[84]

Unconscious biases may become especially serious when combined with an admissions system based on the extreme flexibility and subjectivity that exists at these colleges. As mentioned, three of Caltech's last six presidents have been of Jewish origins, but the objective admissions system has produced no sign of ethnic favoritism, and largely meritocratic MIT also seems unaffected by having had two Jewish presidents of the last five.[85] But when machinery already exists for admitting or rejecting whomever a university wishes, on any

grounds whatsoever, that machinery may be unconsciously steered in a particular direction by the shared group biases of the individuals controlling it.

## The Disturbing Reality of the Elite College Admission System

Perhaps the most detailed statistical research into the actual admissions practices of American universities has been conducted by Princeton sociology professor Thomas J. Espenshade and his colleagues, whose results were summarized in his 2009 book *No Longer Separate, Not Yet Equal*, co-authored with Alexandria Walton Radford. Their findings provide an empirical look at the individual factors that dramatically raise or lower the likelihood of acceptance into the leading American universities which select the next generation of our national elites.

The research certainly supports the widespread perception that non-academic factors play a major role in the process, including athletic ability and legacy status. But as we saw earlier, even more significant are racial factors, with black ancestry being worth the equivalent of 310 points, Hispanics gaining 130 points, and Asian students being penalized by 140 points, all relative to white applicants on the 1600 point Math and Reading SAT scale.[86]

Universities always emphasize the importance of non-academic (and subjective) leadership traits as a central reason why they do not rely upon grades and academic test scores to select at least their white students, arguing that evidence of such personal initiative and leadership should often outweigh somewhat lower academic performance in predicting future success and value to our society. And on the face of it, these claims may seem plausible.

But the difficulty comes from the fact that such subjective factors must necessarily be assessed subjectively, by the particular individuals sitting in the Yale or Columbia admissions offices, and their cultural or ideological background may heavily taint their decision-making. One of Espenshade's most striking findings was that excelling in certain types of completely mainstream high school activities actually *reduced* a student's admission chances by 60–65 percent, apparently because teenagers with such interests were regarded with considerable disfavor by the sort of people employed in admissions; these were ROTC, 4-H Clubs, Future Farmers of America, and various similar organizations.[87] Consider that these reported activities were totally

mainstream, innocuous, and non-ideological, yet might easily get an applicant rejected, presumably for being cultural markers. When we recognize the overwhelmingly liberal orientation of nearly all our elite universities and the large communities of academics and administrators they employ, we can easily imagine what might become of any applicants who proudly proclaimed their successful leadership roles in an activity associated with conservative Christianity or rightwing politics as their extracurricular claim to fame.

Our imagination is given substance by *The Gatekeepers*, a fascinating and very disturbing inside look at the admissions system of Wesleyan, an elite liberal arts college in Middleton, Conn. The author was Jacques Steinberg, a veteran National Education Correspondent at the *New York Times*, and now its editor focusing on college admissions issues. Although Wesleyan definitely ranks a notch or so below the Ivies in selectivity, Steinberg strongly suggests that the admissions decision-making process is very similar, and while his 2002 book described the selection of the Fall 2000 entering class, his afterword to the 2012 edition states that the overall process has remained largely unchanged down to the present day. Whether or not Steinberg himself recognizes it, the most striking fact—which would surely shock students almost anywhere else in the Developed World—is the enormous focus on ideology and ethnic background compared to academic achievement or evidence of intellectual ability, as well as the powerful role of ﬀconnectionsﬀ and clout.

Consider the case of Tiffany Wang, a Chinese immigrant student raised in the Silicon Valley area, where her father worked as an engineer. Although English was not her first language, her SAT scores were over 100 points above the Wesleyan average, and she ranked as a National Merit Scholarship semifinalist, putting her in the top 0.5 percent of high school students (not the top 2 percent as Steinberg mistakenly claims). Nevertheless, the admissions officer rated her just so-so in academics, and seemed far more positively impressed by her ethnic activism in the local school's Asian-American club. Ultimately, he stamped her with a ﬀReject,ﬀ but later admitted to Steinberg that she might have been admitted if he had been aware of the enormous time and effort she had spent campaigning against the death penalty, a political cause near and dear to his own heart. Somehow I suspect that a student who boasted of leadership in pro-death penalty activism among his extracurriculars might have fared rather worse in this process. And presumably for similar reasons, Tiffany was also rejected by all her other prestigious college choices, including Yale, Penn, Duke, and Wellesley, an outcome which greatly surprised and

disappointed her immigrant father.[88]

There was also the case of half-Brazilian Julianna Bentes, with slight black ancestry, who came from a middle-class family and attended on a partial scholarship one of America's most elite prep schools, whose annual tuition now tops $30,000; her SAT scores were somewhat higher than Tiffany's, and she was an excellent dancer. The combination of her academic ability, dancing talent, and multiracial background ranked her as one of America's top college recruitment prospects, gaining her admission and generous financial packages from Harvard, Yale, Stanford and every other elite university to which she applied, including the University of Chicago's most prestigious academic scholarship award and a personal opportunity to meet Chelsea Clinton while visiting Stanford, which she did, before ultimately selecting Yale.[89]

Finally, there was the case of Becca Jannol, a girl from a very affluent Jewish family near Beverly Hills, who attended the same elite prep school as Julianna, but with her parents paying the full annual tuition. Despite her every possible advantage, including test-prep courses and retaking the exam, her SAT scores were some 240 points lower on the 1600 point scale, placing her toward the bottom of the Wesleyan range, while her application essay focused on the philosophical challenges she encountered when she was suspended for illegal drug use. But she was a great favorite of her prep school counselor, who was an old college friend of the Wesleyan admissions officer, and using his discretion, he stamped her Admit. Her dismal academic record then caused this initial decision to be overturned by a unanimous vote of the other members of the full admissions committee, but he refused to give up, and moved heaven and earth to gain her a spot, even offering to rescind the admissions of one or more already selected applicants to create a place for her. Eventually he got her shifted from the Reject category to wait-list status, after which he secretly moved her folder to the very top of the large waiting list pile.[90]

In the end connections triumphed, and she received admission to Wesleyan, although she turned it down in favor of an offer from more prestigious Cornell, which she had obtained through similar means. But at Cornell, she found herself miserable, hating the classes and saying she didn't see the usefulness of [her] being there. However, her poor academic ability proved no hindrance, since the same administrator who had arranged her admission also wrangled her a quick entrance into a special honors program he personally ran, containing just 40 of the 3500 students in her year. This exempted her

from all academic graduation requirements, apparently including classes or tests, thereby allowing her to spend her four college years mostly traveling around the world while working on a so-called "special project." After graduation, she eventually took a job at her father's successful law firm, thereby realizing her obvious potential as a member of America's ruling Ivy League elite, or in her own words, as being one of "the best of the best."[91]

Steinberg's description of the remaining handful of Wesleyan applicants seems to fall into a very similar pattern, indicating that our elite admissions process operates under the principle of "Ideology and Diversity tempered by Corruption." Certainly the majority of the decisions made seem to demonstrate that although the Maoist doctrine of favoring "Red over Expert" was abandoned decades ago in China, it is still alive and well in America's elite university admissions process, though sometimes mitigated by factors of wealth and influence.[92] The overwhelmingly liberal orientation of the elite university community, the apparent willingness of many liberals to actively discriminate against non-liberals, and the fact that American Jews remain perhaps the most liberal ethnic community may together help explain a significant portion of our skewed enrollment statistics.[93]

We should also note that although admissions officers are poorly paid, earning less than public school teachers,[94] they nevertheless control a very valuable resource. According to Steinberg's account, when individual officers are particularly forceful in their advocacy for an obviously under-qualified applicant, their colleagues regularly ask them, perhaps jokingly, "how much are they paying you to get that student admitted?"[95] Indeed, Golden states that admissions officers at top universities are constantly being offered explicit bribes, sometimes even including promises of houses or cruises.[96] And although Steinberg's presentation of Wesleyan's admissions practices was glowingly favorable, it may have been more than pure coincidence that the particular admissions officer who was the focus of his reporting decided to seek employment elsewhere just before the book was scheduled to appear in print.[97]

Steinberg's narrative is engagingly written and he makes no effort to conceal his own ideological orientation, but some of his major lapses are troubling. For example, he accepts without question the notion that Asian-American applicants receive a racial "diversity" boost in elite admissions, though it has been obvious for decades that the exact opposite is true. And in his introduction, he describes the disturbingly exclusionary world of the past, explaining that until the late 1950s

Jews "need not have bothered trying" to enroll at Harvard or the other Ivies.[98] Yet in fact, Jews were heavily, often massively over-represented in the Ivy League throughout the entire Twentieth Century, and by 1952 constituted 25 percent of Harvard undergraduates, a rate some 700 percent higher than their share of the general population.[99]

Steinberg is an award-winning journalist who has spent most of the last 15 years covering education for the *New York Times*, and surely ranks near the very top of his profession; his book was widely reviewed and almost universally praised. For such huge factual errors to pass unnoticed is a very disturbing indication of the knowledge and assumptions of the individuals who shape our public perceptions on the realities of higher education in our society.

In fact, it seems likely that some of these obvious admissions biases we have noticed may be related to the poor human quality and weak academic credentials of many of the university employees making these momentous decisions. As mentioned above, the job of admissions officer is poorly paid, requires no professional training, and offers few opportunities for career advancement; thus, it is often filled by individuals with haphazard employment records. As one of the "Little Ivies," Wesleyan is among America's most prestigious liberal arts colleges, and Steinberg's description of the career paths of its handful of admissions officers is eye-opening: the interim Director of Admissions had most recently screened food-stamp recipients and run a psychiatric half-way house; another had worked as an animal control officer and managed a camera store; a third unsuccessfully sought a job as a United Airlines flight attendant; others were recent college graduates, whose main college interests had been sports or ethnic studies.[100] The vast majority seem to possess minimal academic expertise and few intellectual interests, raising serious questions about their ability to reasonably evaluate their higher-quality applicants.

As additional evidence, we can consider *What It Really Takes to Get into the Ivy League*, a 2003 advice book written by Chuck Hughes, who spent five years as a Senior Admissions Officer at Harvard, after having himself graduated from that university. Although he strongly emphasizes his own college participation in varsity sports, he never says a word about any personal academic interests, and near the end of his book on elite college admissions, he appears to describe Duke, Northwestern, and Rice as being members of the Ivy League.[101]

A more explicit statement of this exact problem is found in *A for Admission*, a very candid 1997 description of the admissions process at elite private universities written by Michele A. Hernandez, who had spent four years as Dartmouth's Assistant Director of Admissions. Near the beginning of her book, Hernandez explains that over half of Ivy League admissions officers are individuals who had not attended such academically challenging universities, nor probably had the intellectual capability to do so, and were sometimes confused about the relative ranking of SAT scores and other basic academic credentials. She also cautions students to avoid any subtlety in their essays, lest their words be misunderstood by their readers in the admissions office, whose degrees are more likely to have been in education than in any serious academic discipline.[102]

It seems quite possible that poorly-paid liberal arts or ethnic-studies majors, probably with few quantitative skills and a vaguely "progressive" ideological focus, could implement highly unfair admissions decisions without even realizing their actions. According to Steinberg, admissions officers seem to assume that an important part of their duty is maximizing non-white enrollment, and this is especially true if they themselves are non-white, while there is no indication that they are actually aware of America's overall population distribution.[103]

The last point is not a trivial one, since although our country is only about 13 percent black, according to a 2001 Gallup survey most people thought the figure was 33 percent, with the average non-white putting it at 40 percent.[104] This was roughly confirmed by the GSS respondents in 2000, who also believed that nearly 18 percent of Americans were Jewish, a figure more than eight times too large.[105] A very recent 2012 survey found that Americans believe Protestants outnumber Jews in this country by only 2.5 to 1, when the actual ratio is ten times greater.[106]

Such shocking demographic ignorance is hardly confined solely to the uneducated. For example, soon after Karabel's book appeared, a prominent Massachusetts law school dean with a major interest in ethnic discrimination issues devoted two hours of his televised public affairs program to a detailed discussion of the topic with the author, but at the end let slip that he believed California's population was 50 percent Asian, an utter absurdity.[107] So perhaps many college administrators may have little idea about which ethnic groups are already enrolled above parity and which are below, instead taking their marching orders from an amorphous academic narrative which valorizes "racial diversity."

Meanwhile, any hint of "anti-Semitism" in admissions is regarded as an absolutely mortal sin, and any significant reduction in Jewish enrollment may often be denounced as such by the hair-trigger media. For example, in 1999 Princeton discovered that its Jewish enrollment had declined to just 500 percent of parity, down from more than 700 percent in the mid-1980s, and far below the comparable figures for Harvard or Yale. This quickly resulted in four front-page stories in the *Daily Princetonian*, a major article in the *New York Observer*, and extensive national coverage in both the *New York Times* and the *Chronicle of Higher Education*.[108] These articles included denunciations of Princeton's long historical legacy of anti-Semitism and quickly led to official apologies, followed by an immediate 30 percent rebound in Jewish numbers. During these same years, non-Jewish white enrollment across the entire Ivy League had dropped by roughly 50 percent, reducing those numbers to far below parity, but this was met with media silence or even occasional congratulations on the further "multicultural" progress of America's elite education system.

I suspect that the combined effect of these separate pressures, rather than any planned or intentional bias, is the primary cause of the striking enrollment statistics that we have examined above. In effect, somewhat dim and over-worked admissions officers, generally possessing weak quantitative skills, have been tasked by their academic superiors and media monitors with the twin ideological goals of enrolling Jews and enrolling non-whites, with any major failures risking harsh charges of either "anti-Semitism" or "racism." But by inescapable logic maximizing the number of Jews and non-whites implies minimizing the number of non-Jewish whites.

## Problems with Pure Diversity and Pure Meritocracy

In recent decades, elite college admissions policy has frequently become an ideological battlefield between liberals and conservatives, but I would argue that both these warring camps have been missing the actual reality of the situation.

Conservatives have denounced "affirmative action" policies which emphasize race over academic merit, and thereby lead to the enrollment of lesser qualified blacks and Hispanics over their more qualified white and Asian competitors; they argue that our elite institutions should be color-blind and race-neutral. Meanwhile, liberals have countered that the student body of these institutions

should ﷺlook like America,ﷺ at least approximately, and that ethnic and racial diversity intrinsically provide important educational benefits, at least if all admitted students are reasonably qualified and able to do the work.

My own position has always been strongly in the former camp, supporting meritocracy over diversity in elite admissions. But based on the detailed evidence I have discussed above, it appears that both these ideological values have gradually been overwhelmed and replaced by the influence of corruption and ethnic favoritism, thereby selecting future American elites which are not meritocratic nor diverse, neither being drawn from our most able students nor reasonably reflecting the general American population.

The overwhelming evidence is that the system currently employed by most of our leading universities admits applicants whose ability may be unremarkable but who are beneficiaries of underhanded manipulation and favoritism. Nations which put their future national leadership in the hands of such individuals are likely to encounter enormous economic and social problems, exactly the sort of problems which our own country seems to have increasingly experienced over the last couple of decades. And unless the absurdly skewed enrollments of our elite academic institutions are corrected, the composition of these feeder institutions will ensure that such national problems only continue to grow worse as time passes. We should therefore consider various means of correcting the severe flaws in our academic admissions system, which functions as the primary intake valve of our future national elites.

One obvious approach would be to wave a magic wand and make the existing system ﷺwork betterﷺ by replacing many thousands of college admissions officers by individuals more competent and less venal, guardians of the common good who would properly balance objective academic merit against other intrinsic student qualities, while avoiding any lapse into rank favoritism. But this same simple solution could always be proposed for any other obviously failing system, including Soviet-style Communism.

A more fundamental change might be to directly adopt the implicit logic of America's ﷺacademic diversityﷺ movement—whose leadership has been overwhelmingly Jewish[109]—and require our elite universities to bring their student bodies into rough conformity with the overall college-age population, ethnicity by ethnicity, in which case the Jewish presence at Harvard and the rest of the Ivy League would drop to between 1.5 and 2 percent.[110]

However, even leaving aside the rights and wrongs of such a proposal, it would be extremely difficult to implement in practice. The pattern of American ethnic origins is complex and interwoven, with high intermarriage rates, leading to categories being fluid and ambiguous. Furthermore, such an approach would foster clear absurdities, with wealthy Anglo-Saxons from Greenwich, Conn. being propelled into Yale because they fill the "quota" created on the backs of the impoverished Anglo-Saxons of Appalachia or Mississippi.

An opposite approach would be to rely on strictest objective meritocracy, with elite universities automatically selecting their students in academic rank-order, based on high school grades and performance on standardized exams such as the SAT. This approach would be similar to that used in many other developed countries around the world, but would produce severe social problems of its own.

Consider the notorious examples of the single-minded academic focus and testing-frenzy which are already sometimes found at many predominantly Asian immigrant high schools, involving endless cram-courses and massive psychological pressure. This seems very similar to the stories of extreme educational effort found in countries such as Japan, South Korea, and China, where educational success is an overriding social value and elite admissions are fully determined by rank-order academic performance. At present, these severe educational pressures on American teenagers have been largely confined to a portion of our small Asian-American population and perhaps some of their non-Asian schoolmates, but if Harvard and its peers all selected their students based on such criteria, a huge fraction of American students would be forced to adopt similar work-habits or lose any hope of gaining admission. Do we really want to produce an entire nation of "Asian Tiger Moms" of all ethnicities and backgrounds, probably with horrible consequences for the future mental health, personal creativity, and even long-term academic performance of the next generation?

Also, we would expect such a system to heavily favor those students enrolled at our finest secondary schools, whose families could afford the best private tutors and cram-courses, and with parents willing to push them to expend the last ounce of their personal effort in endless, constant studying. These crucial factors, along with innate ability, are hardly distributed evenly among America's highly diverse population of over 300 million, whether along geographical, socio-economic, or ethnic lines, and the result would probably be an extremely unbalanced enrollment within the ranks of our top universities,

perhaps one even more unbalanced than that of today. Although American cultural elites may currently pay too much lip service to "diversity" as a value, there is also such a thing as too little educational diversity. Do we really want a system in which all of America's top 100 universities selected their students much like Caltech does today, and therefore had a similar academic environment?

We should also consider that under such a selection system, any interest or involvement not directly contributing to the academic transcript—including activities associated with artistic talent, sports ability, or extra-curricular leadership—would disappear from our top universities, since students who devoted any significant time to those pursuits would tend to lose out to those who did not. Even those highest-ability students who gained admission would tend to forego the benefits of encountering classmates with a somewhat more balanced mix of interests and abilities, a group closer to the American mainstream, and might therefore develop a very one-sided and unrealistic view of our national population. And if every student admitted to Harvard believed, not without some justification, that he had been objectively determined to be among the smartest and hardest working 0.05 percent of all Americans his age, that might not be the best psychological starting point for a teenager just entering his adult life and future career.

These same problems would also manifest themselves in an admissions system based on strict meritocracy as adjusted by socio-economic status, which Richard Kahlenberg prominently advocated in his 1996 book *The Remedy*, and various other writings. Although this approach has always seemed reasonably attractive to me and the results would certainly provide more socio-economical balance than straight meritocracy, other "diversity" enhancements might be minimal. We should remember that a significant fraction of our Asian immigrant population combines very low socio-economic status with extremely strong academic performance and educational focus, so it seems likely that this small group would capture a hugely disproportionate share of all admissions spots influenced by these modifying factors, which may or may not be fully realized by advocates of this approach.

## An Inner Ring and an Outer Ring

But if selecting our future elites by purest "diversity" wouldn't work, and using purest "meritocracy" would seem an equally bad idea, what would be the right approach to take as a replacement for today's

complex mixture of diversity, meritocracy, favoritism, and corruption?

Perhaps an important starting point would be to recognize that in any normal distribution curve, numbers widen greatly and differences become far less significant below the very top. Today's academic supporters of "affirmative action" frequently claim that beneath the strongest tier of academic applicants to Yale or Stanford, the differences between particular students become relatively small, only slightly indicative of how they will perform at the college if they are enrolled;[111] and this claim is not entirely false. A large fraction of all the students applying have demonstrated that they have the ability and commitment to adequately perform the college work in question, and although they are unlikely to graduate in the top 5 percent of Princeton's class, the same is also true of the vast majority of their classmates. The average student at Harvard is going to be an average Harvard student, and perhaps it would be better if a large majority of the admitted students would not find this prospect a horrifying disappointment after their previously stellar career of having always been the biggest student fish in their smallish academic ponds.

The notion of top universities only selecting a slice of their students based on purest academic merit certainly seems to be the standard today, and was so in the past as well. Karabel recounts how during the 1950s and 1960s, Harvard reserved about 10 percent of its spots for "top brains," while selecting the remainder based on a mixture of different factors.[112] In *Choosing Elites*, Robert Klitgaard indicates that roughly this same approach continued into the 1980s, with only a fraction of admitted students being classified and admitted as "first-class scholars."[113] As already mentioned, according to Hughes, who served five years as a Harvard Senior Admissions Officer at Harvard, by the mid-2000s only 5 percent or less of Harvard undergraduates were selected purely on academic merit, with extracurricular activities and a wide variety of unspecified other criteria being used to choose among the other 80–85 percent of applicants who could actually handle the academic work; and this same pattern is found at most other highly selective universities.[114] Given a widening funnel of ability, it is absurd to base admissions decisions on just a small difference of twenty or thirty points on the SAT, which merely encourages students to spend thousands of hours cramming in order to gain those extra crucial twenty or thirty points over their competitors.

But if our elite colleges were to select only a portion of their students based on purest academic merit, how should they pick the remainder, merely by flipping a coin? Actually, that might not be such a terrible

idea, at least compared with the current system, in which these decisions are often seemingly based on massive biases and sometimes even outright corruption. After all, if we are seeking a student body which is at least somewhat diverse and reasonably representative of the American population, random selection is hardly the least effective means of ensuring that outcome. And the result would be true diversity, rather than the dishonest and ridiculous pseudo-diversity of our existing system.

The notion of using random selection to overcome the risk of unfair bias has been used for centuries, including in our own country, and is regularly found in matters of the greatest civic importance, especially those involving life and death. Our jury system relies on the random selection of a handful of ordinary citizens to determine the guilt or innocence of even the most eminent and powerful individuals, as well as to render corporate verdicts with penalties reaching into the billions. The millions of Americans ordered to fight and perhaps die in our major wars were generally called into the military by the process of a random draft lottery. And today, the enormous growth of games of chance and financial lotteries, often government-run, have become an unfortunate but very popular aspect of our entire economic system. Compared to these situations, requiring an excellent but hardly spectacular student to take his chances on winning a spot at Harvard or Yale hardly seems unreasonable.

In *The Big Test*, journalist Nicholas Lemann traces the history of meritocratic admissions policy, and the philosophical conflicts which liberals faced once that policy first came into direct conflict with the racial diversity they also favored, beginning when the *DeFunis* "reverse discrimination" case reached the U.S. Supreme Court in 1974. At that point, one of the high court's strongest liberal voices was Justice William O. Douglas, and he repeatedly considered the possible use of random lotteries as the fairest means of allocating college admissions slots below the top tier of most highly qualified applicants. [115]

Let us explore the likely social implications of such an admissions policy, focusing solely on Harvard and following a very simple model, in which (say) 300 slots or around 20 percent of each entering class are allocated based on pure academic merit (the "Inner Ring"), with the remaining 1300 slots being randomly selected from the 30,000 or so American applicants considered able to reasonably perform at the school's required academic level and thereby benefit from a Harvard education (the "Outer Ring").

First, we must recognize that the 300 applicants admitted by straight merit would be an exceptionally select group, representing just the top 2 percent of America's 16,000 NMS semifinalists. Also, almost any American students in this group or even reasonably close would be very well aware of that fact, and more importantly, nearly all other students would realize they were far too distant to have any chance of reaching that level, no matter how hard they studied or how many hours they crammed, thus freeing them from any terrible academic pressure. Under today's system, the opaque and haphazard nature of the admissions process persuades tens of thousands of students they might have a realistic shot at Harvard if only they would study a bit harder or participate in one more resume-stuffing extracurricular, [116] but that would no longer be the case, and they would be able to relax a bit more during their high school years, just so long as they did well enough to qualify and try their luck as one of the "Outer Ring" of applicants.

The 300 Inner Ring students would certainly be quite different in all sorts of ways from the average high school student, even aside from their greater academic ability and drive; they might not be "diverse" in any sense of the word, whether geographically, ethnically, or socio-economically. But the remaining 1300 Outer Ring students would represent a random cross-section of the tens of thousands of students who applied for admission and had reasonably good academic ability, and since they would constitute 80 percent of the enrollment, Harvard would almost certainly become far more diverse and representative of America's total population in almost all ways than is the case today, when 30 percent of its students come from private schools, often the most elite and expensive ones.[117]

Furthermore, the vast majority of Harvard graduates—and everyone who later dealt with them—would know perfectly well that they had merely been "lucky" in gaining their admission, thereby tempering the sort of arrogance found among too many of today's elite college graduates. And our vast and growing parasitic infrastructure of expensive cram-schools, private tutors, special academies, and college application consultants would quickly be reduced to what was merited by their real academic value, which may actually be close to nil. A general armistice would have been declared in America's endlessly growing elite admissions arms-race.

Under such a system, Harvard might no longer boast of having America's top Lacrosse player or a Carnegie Hall violinist or a Senatorial scion. But the class would be filled with the sort of reasonably talented and reasonably serious athletes, musicians, and

activists drawn as a cross-section from the tens of thousands of qualified applicants, thereby providing a far more normal and healthier range of students.

The terrible family pressure which students, especially immigrant students, often today endure in the college admissions process would be greatly reduced. Even the most ambitious parents would usually recognize that their sons and daughters are unlikely to ever outrank 99.99 percent of their fellow students academically, so their only hope of reaching a school like Harvard would be the same as that of everyone else, via the admissions lottery. And losing in a random drawing can hardly be a source of major shame to any family.

One of the most harmful aspects of recent American society has been the growth of a winner-take-all mentality, in which finishing even just slightly below the top rung at any stage of the career ladder seems to amount to economic and sometimes personal failure. An aspect of this is that our most elite businesses tend to only recruit from the top universities, assuming that these possess a near-monopoly on the brightest and most talented students, even though it actually appears that favoritism and corruption these days are huge factors in admission. But if it were explicitly known that the vast majority of Harvard students had merely been winners in the application lottery, top businesses would begin to cast a much wider net in their employment outreach, and while the average Harvard student would probably be academically stronger than the average graduate of a state college, the gap would no longer be seen as so enormous, with individuals being judged more on their own merits and actual achievements. A Harvard student who graduated *magna cum laude* would surely have many doors open before him, but not one who graduated in the bottom half of his class.

This same approach of an Inner Ring and an Outer Ring of admissions could similarly be applied to most of America's other selective colleges, perhaps with some variations in the relative sizes of the two groups. It is possible that some universities such as Caltech, which today selects its 200 entering freshmen by purely meritocratic academic rank-order, might prefer to retain that system, in which case the Inner Ring would constitute the entire enrollment. Other universities, which glorify the extremes of total diversity, might choose to select almost all their students by random lot. But for most, the sort of split enrollment I have outlined might work reasonably well.

Since colleges would still be positioned in a hierarchy of national

excellence and prestige, those students whose academic record just missed placing them within the Inner Ring of a Harvard or a Yale would almost certainly gain automatic admission to a Columbia, Cornell, or Duke, and the same sort of cascading effect would be found down through all subsequent layers of selectivity. Thus, although America's top couple of thousand students each year would not all be found among the 4000 entering Harvard, Yale, or Princeton, they would at least gain admission to some Ivy or its equivalent, in contrast to the shocking examples of admissions injustice recounted by Golden.

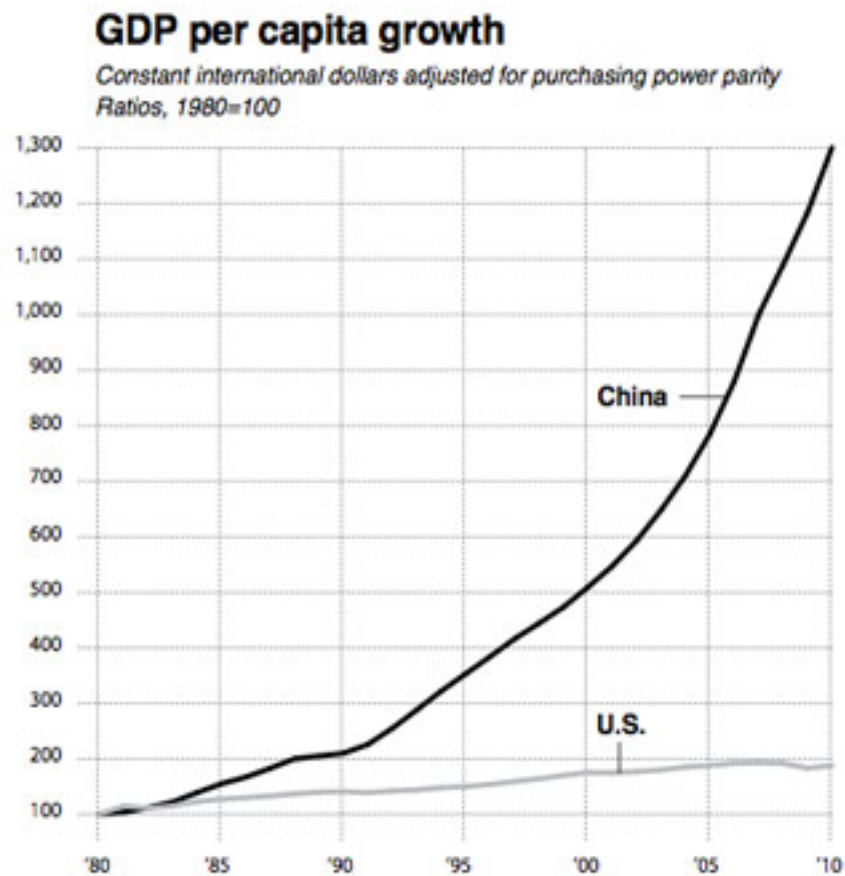
Since essays, personal statements, lists of extracurricular achievements and so many other uniquely complex and time-consuming elements of the American admissions process would no longer exist, students could easily apply to long lists of possible colleges, ranking them in order of personal preference. Meanwhile, the colleges themselves could dispense with nearly their entire admissions staff, since the only remaining part of the admissions process would be determining the academic ranking of the tiny fraction of top applicants, which could be performed quickly and easily. Harvard currently receives almost 35,000 applications, which must each be individually read and evaluated in a massive undertaking, but applying a crude automatic filter of grades and test scores would easily winnow these down to the 1,000 plausible candidates for those 300 Inner Ring slots, allowing a careful evaluation of those highest-performing students on pure academic grounds.

Eliminating at a stroke the enormous expense and complexity of our baroque admissions process might actually raise the quality of the students attending elite colleges by drawing more applicants into the system, especially if, as I suggest elsewhere, tuition at our top private colleges were drastically reduced or even eliminated (See Paying Tuition to a Giant Hedge Fund).

The late James Q. Wilson certainly ranked as one of America's most highly-regarded social scientists of the second half of the twentieth century, and when he was awarded the Gold Medal of the National Institute of Social Sciences in 2011, his remarks provided some fascinating details of his own educational background. Although an outstanding high school student in Southern California, no one in his family had ever previously attended college nor had he himself given it any thought, instead starting work in his father's auto repair shop after graduation in order to learn the trade of a car mechanic. However, one of his teachers arranged his admission to a small college on a full scholarship, which launched him on his stellar academic

career.[118]

It seems likely that the vast paperwork and expense of today's admissions system, with its endless forms, intrusive questionnaires, fee-waiver-applications, and general bureaucracy intimidates many bright students, especially those from impoverished or immigrant backgrounds, and deters them from even considering an application to our elite colleges, especially since they perhaps wrongly assume that they would stand no chance of success. But filling out a few very simple forms and having their test scores and grades scores automatically forwarded to a list of possible universities would give them at least the same chance in the lottery as any other applicant whose academic skills were adequate.



Following the 1991 collapse and disintegration of the Soviet Union, some observers noted with unease that the United States was left as about the only remaining large and fully-functional multi-ethnic

society, and the subsequent collapse and disintegration of ethnically diverse Yugoslavia merely strengthened these concerns. China is sometimes portrayed by the ignorant American media as having large and restive minority populations, but it is 92 percent Han Chinese, and if we exclude a few outlying or thinly populated provinces—the equivalents of Alaska, Hawaii, and New Mexico—closer to 95 percent Han, with all its top leadership drawn from that same background and therefore possessing a natural alignment of interests. Without doubt, America's great success despite its multiplicity of ethnic nationalities is almost unique in modern human history. But such success should not be taken for granted.

Many of the Jewish writers who focus on the history of elite university admissions, including Karabel, Steinberg, and Lemann, have critiqued and rebuked the America of the first half of the Twentieth Century for having been governed by a narrow WASP ascendency, which overwhelmingly dominated and controlled the commanding heights of business, finance, education, and politics; and some of their criticisms are not unreasonable. But we should bear in mind that this dominant group of White Anglo-Saxon Protestants—largely descended from among the earliest American settlers and which had gradually absorbed and assimilated substantial elements of Celtic, Dutch, German, and French background—was generally aligned in culture, religion, ideology, and ancestry with perhaps 60 percent of America's total population at the time, and therefore hardly represented an alien presence.[119] By contrast, a similarly overwhelming domination by a tiny segment of America's current population, one which is completely misaligned in all these respects, seems far less inherently stable, especially when the institutional roots of such domination have continually increased despite the collapse of the supposedly meritocratic justification. This does not seem like a recipe for a healthy and successful society, nor one which will even long survive in anything like its current form.

Power corrupts and an extreme concentration of power even more so, especially when that concentration of power is endlessly praised and glorified by the major media and the prominent intellectuals which together constitute such an important element of that power. But as time goes by and more and more Americans notice that they are poorer and more indebted than they have ever been before, the blandishments of such propaganda machinery will eventually lose effectiveness, much as did the similar propaganda organs of the decaying Soviet state. Kahlenberg quotes Pat Moynihan as noting that the stagnant American earnings between 1970 and 1985 represented the longest stretch of 'flat' income in the history of the European

settlement of North America.[120] The only difference today is that this period of economic stagnation has now extended nearly three times as long, and has also been combined with numerous social, moral, and foreign policy disasters.

Over the last few decades America's ruling elites have been produced largely as a consequence of the particular selection methods adopted by our top national universities in the late 1960s. Leaving aside the question of whether these methods have been fair or have instead been based on corruption and ethnic favoritism, the elites they have produced have clearly done a very poor job of leading our country, and we must change the methods used to select them. Conservative William F. Buckley, Jr. once famously quipped that he would rather entrust the government of the United States to the first 400 names listed in the Boston telephone directory than to the faculty of Harvard. So perhaps an important step in solving our national problems would be to apply a similar method to selecting the vast majority of Harvard's students.

[3]See Ho (2009) pp. 11, 13, 40-69 *passim*, 256 for an extensive

discussion of the college background and recruitment choices made by Wall Street firms in recent years. According to her "ethnography" of Wall Street, major financial firms recruit very heavily from Harvard and Princeton, somewhat less at the remaining Ivy League schools and a few others such as Stanford and MIT, and rarely anywhere else, partly because they believe admission to elite universities provide evidence of "smartness," which Wall Street values above all else (p. 38).

The claim that attendance at an Ivy League or other elite university provides a substantial advantage over similarly talented individuals has been disputed by the recent research of Stacy Dale and Alan B. Krueger, but their findings are based on students who graduated college almost two decades ago, and probably do not capture the dramatic recent changes in the American economy and Wall Street practices since that time. [17] Admittedly, surveys show that the vast majority of Asian-Americans do not believe their racial background hurts their chances of college admission, but such factors would obviously apply primarily only at the elite, highly selective universities, which only a small fraction of Asians seek to attend. [19] Espanshade (2009) p. 92-93.

[20] Golden (2006) p. 200.

[21] The elite university enrollment statistics for Asians and other racial and ethnic groups derived from the NCES data are provided in Appendix C. All the Asian figures provided by the NCES exclude "mixed race" individuals, who were previously included in the "Race Unknown" category but since 2009 have been provided separately.

[22] Hsia (1988) pp. 93-148, Takagi (1992/1998).

[23] For example, see Oren (1985) pp. 320-322 and Synnott

(1979/2010) pp. 112,195.

[24] A portion of this decline in relative Asian enrollment may be apparent rather than real. As noted earlier, some Asian applicants, especially those of mixed parentage and without an identifying Asian name, may attempt to conceal their non-white ancestry in hopes of enhancing their likelihood of admission. But such a situation can hardly be used to justify Ivy League policy, and since the numbers are unknown, we must generally confine our analysis to the officially reported statistics.

[25] It should be noted that some former Ivy League admissions officers strongly deny such charges of anti-Asian bias. For example, Chuck Hughes, who spent five years as a Harvard Senior Admissions Officer, claims in his 2003 book that Asian American applicants—just like blacks, Hispanics, American Indians, and other non-whites—actually receive a beneficial "tip" in evaluating their application packages. It should also be noted that Hughes strongly emphasizes his own enthusiastic participation in varsity sports as a Harvard undergraduate, while avoiding mention of any academic interests. See Hughes (2003) pp. 86, 145.

[26] Hsia (1988) pp. 98-99; Karabel (2005) p. 500.

[27] Indeed, Dean L. Fred Jewett of Harvard suggested in 1985 that among Asians "family pressure makes more marginal students apply" but provided no evidence for this claim, which seems contradicted by the objective evidence. See Hsia (1988) p. 97.

[28] College Confidential, September 16, 2011: http://talk.collegeconfidential.com/13210307-post724.html .

[29] One apparent difficulty in such Asian surname analysis might be the case of mixed-race individuals with Asian names, but this difficulty is quite insignificant. First, mixed-race Asians are only about 15% of the total Asian population, and are excluded from our Asian statistics for college enrollments. Meanwhile, until quite recently, the overwhelming majority of marriages between Asians and non-Asians involved an Asian wife, hence the last names of any children would tend not to be Asian and would be excluded from our list analysis. Thus, both our college enrollment figures and our academic performance estimates tend to exclude part-Asians and should be fully consistent.

[30] The 2000 Census lists 310,125 Nguyens, or about 1 in 3.6 of the

total Vietnamese population of 1,122,528. Meanwhile, there were 194,067 Kims, representing 1 in 5.5 of the 1,076,872 Koreans.

[31] Weyl (1987) pp. 26-27.

[32] Stephan and Abigail Thernstrom, *America in Black and White* (1997) pp. 398-400 provides some racial statistics on the past distribution of top SAT scores which would strongly support this conclusion. In 1981, Asians were just 2% of the college-age population but accounted for over 4% of students with Verbal scores of 700 or above and 11% of those with Math scores of 750 or above. By 1995, college-age Asians were still just 3% of the total, but produced over 14% of those high Verbal scores and a remarkable 28% of the high Math scores. Since Asian-Americans have now increased to roughly 5% of students of college age and have also become much more affluent, we would expect such figures to be far higher today.

[33] Although the primary measure of human "fluid intelligence"—so-called "g"—is measured consistently across different groups, for reasons not entirely clear the three principal subcomponents of Verbal, Mathematical, and Visuospatial abilities sometimes vary substantially across racial or ethnic lines. For example, East Asians tend to be especially strong in Visuospatial ability but much less so in Verbal ability, Jews are extremely strong in Verbal but mediocre in Visuospatial skills, while most white Europeans tend to be intermediate in both these different categories. See Vernon (1982) pp. 20-21, 160-163, 178-180, 272-277.

[34] Suein Hwang, "The New White Flight," *The Wall Street Journal*, November 19, 2005: http://online.wsj.com/article/SB113236377590902105-search.html .

[35] At his 1992 Milwaukee trial, Jeffrey Dahmer freely admitted torturing, killing, and cannibalizing 17 young men, but vigorously denied he had selected his mostly black victims out of any racial bias. In a more typical case, after black Connecticut truck driver Omar Thornton massacred five of his white co-workers, the media focused considerable attention on whether they had been innocent victims or "racists" as Thornton had alleged.

[36] In recent years, the Reading and Writing SAT scores for entering freshmen at all four universities have been almost identical, while the Math SAT scores at Caltech have been significantly higher, as have been the percentages of National Merit Scholars. See the NCES website: http://nces.ed.gov/collegenavigator/ and Steve Hsu, "Elite

Universities and Human Capital Mongering,” October 10, 2010: http://infoproc.blogspot.com/2010/10/elite-universities-and-human-capital.html .

[37] Indeed, the 1988 official register of Harvard, intended for prospective applicants, actually described the Harvard admissions process as “complex, subjective, and sometimes difficult to comprehend.” See Takagi (1992/1998) p. 63.

[38] As Asian applications to the University of California system grew rapidly during the 1980s, there were major efforts to replace a simple and objective meritocratic admissions system with a “holistic” and opaque system, closer to that of the Ivies, which had the initial effect of sharply reducing Asian admissions. See Hsia (1988) pp. 106-119, Takagi (1992/1998). However, political resistance by Asian groups in California and especially the subsequent passage of Proposition 209 eventually overcame these policies.

[39] Earlier this month, a lengthy New York Times article on Asian admissions issues written by the newspaper's former Education Editor argued that the use of objective admissions standards had caused the Berkeley and UCLA campuses to become more than half Asian, and suggested that this had led to adverse social and educational consequences. However, this claim contains serious factual errors, given that the 2011 Asian undergraduate enrollments were just 37% and 34% respectively, and had never come close to half at any point in history. See Ethan Bronner, “Asian-Americans in the Argument,” *The New York Times*, November 4, 2012: http://www.nytimes.com/2012/11/04/education/edlife/affirmative-action-a-complicated-issue-for-asian-americans.html .

[40] Asians are currently 72% of the students at Stuyvesant and 63% at Bronx Science, while the latter school was just 20% Asian in 1986. See Kyle Spencer, “For Asians, School Tests Are Vital Steppingstones,” *The New York Times*, October 28, 2012: http://www.nytimes.com/2012/10/27/education/a-grueling-admissions-test-highlights-a-racial-divide.html and Deborah Anderluh, “High School for Gifted Kids May Open in L.A.,” *The Los Angeles Herald-Examiner*, September 28, 1986:

PATIO COVER & ENCLOSURE

[41] In the mid-1980s, charges that anti-Asian discrimination in the UC system were similar to the old "Jewish quotas" of the Ivy League quickly provoked television network coverage. See Takagi (1992/1998) pp. 50-51.

[42] Media coverage played a huge role in influencing the growth and outcome of the battle over the admissions of Asians to the UC system. See Takagi (1992/1998) pp.49-51, 74-77, 100-103.

[43] Asian-Americans had 2010 median annual household income of $66,000, about 22% higher than the white figure and were almost 60% more likely to have graduated from college, in each case ranking the highest of any racial group. See "The Rise of Asian Americans," *Pew Research Center*, June 19, 2012: http://www.pewsocialtrends.org/2012/06/19/the-rise-of-asian-americans/ .

[44] In defending Harvard against 1980s accusations of anti-Asian discrimination in admissions, Dean Fred Jewett made exactly this point regarding the impact of Asian geographical concentration. See Takagi (1992/1998) p. 69.

[45] These were exactly the arguments made by a relatively recent Harvard graduate who had served as Editor-in-Chief of the *Harvard Independent* and also reported on admissions practices. See Matthew Yglesias, "Harvard and Princeton Clearly Discriminate Against Asian Applicants; the Question Is Whether It's Illegal," *Slate.com*, February

14, 2012: http://www.slate.com/blogs/moneybox/2012/02/14/harvard_and_princeton_clearly_discriminate_against_asian_appliants_the_question_is_whether_it_s_illegal.html

[46] Daniel Golden, "Harvard Targeted in U.S. Asian-American Discrimination Probe, *Bloomberg News*, February 2, 2012: http://www.bloomberg.com/news/2012-02-02/harvard-targeted-in-u-s-asian-american-discrimination-probe.html ; Daniel E. Slotnik, "Do Asian-Americans Face Bias in Admissions at Elite Colleges?," *The New York Times*, February 8, 2012: http://thechoice.blogs.nytimes.com/2012/02/08/do-asian-americans-face-bias-in-admissions-at-elite-colleges/ ; Editorial, "A Ludicrous Lawsuit," *The Harvard Crimson*, February 8, 2012: http://www.thecrimson.com/article/2012/2/8/lawsuit-admissions-fair/ .

[47] Dana Vachon, "The Code of the Winklevii," *Vanity Fair*, December 2011: http://www.vanityfair.com/business/features/2011/12/winklevosses-201112 .

[48] For decades, comparing and contrasting Asian-Americans with Jews has been a commonplace in public policy analysis, given that both groups are small but high-performing minorities in American society. See, for example, "The Triumph of Asian-Americans" and "Asians and Jews," David A. Bell, *The New Republic*, July 15-22, 1985 and Michael Barone, *The New Americans* (2001) pp. 193-274. Indeed, one-third of Barone's book consists of the section entitled "Jews and Asians." Most recently, the entire front page of the *Wall Street Journal* Weekly Review section was devoted to exactly this topic; see Lee Siegel, "Rise of the Tiger Nation," *Wall Street Journal*, October 27-28, 2012: http://online.wsj.com/article/SB10001424052970204076204578076613986930932.html .

[49] Jewish enrollment estimates for elite universities are summarized in Appendix D.

[50] Karabel (2005) p. 536.

[51] Since the overwhelming majority of Harvard's foreign students are drawn from non-white countries or countries with negligible Jewish populations, it is likely that nearly all the Jewish students reported by Hillel are American. However, 6.2% of Harvard undergraduates refused to report their race in 2011, and many of these, possibly a majority, may actually be white. This "Race Unknown" category has typically ranged between 5% and 15% of Harvard undergraduates over the last couple of decades, with roughly

similar numbers at most other Ivy League schools.

[52] For all these Jewish demographic estimates, see Appendix B.

[53] The combined undergraduate enrollment of the eight Ivy League universities includes roughly 12,000 Jews, 9,000 Asians, and 13,000 non-Jewish whites, as well as 5,000 students whose racial background is unknown. The population of college-age Americans consists of roughly 10 million whites, including 300,000 Jews, and 800,000 Asians.

[54] Steve Sailer, "National Merit Semifinalists by School and Name," September 18, 2010: http://isteve.blogspot.com/2010/09/national-merit-semifinalists-by-school.html ; "The Far East Rises in the West," Takimag.com, February 29, 2012: http://takimag.com/article/the_far_east_rises_in_the_west_steve_sailer/print ; "More Views on California Surnames of Semifinalists," February 29, 2012: http://isteve.blogspot.com/2012/02/more-views-on-california-sunrnames-of.html . Obviously such a Jewish surname analysis would miss the children of intermarried families in which the husband was non-Jewish, hence only count half the half-Jews. However, any such errors introduced are probably small relative to the broader uncertainty in defining and estimating total Jewish numbers, the ambiguity in identifying Jewish names, and the likely estimation errors in the Jewish college enrollment statistics.

[55] Fernanda Santos, "To Be Black at Stuyvesant High," *The New York Times*, February 25, 2012: http://www.nytimes.com/2012/02/26/education/black-at-stuyvesant-high-one-girls-experience.html . In 2012, Asians were 72.5% of Stuyvesant students, with all whites at just 24%, of whom an unspecified fraction were Jewish. Charles Murray has noted that in 1954, Jewish children comprised 24/28 or 85% of the highest-scoring students in NYC on a citywide IQ test, although at that point Jews were probably a little less than 30% of the city's total white population, so a similar degree of over-representation at the local elite academic schools seems plausible. See Charles Murray, "Jewish Genius," *Commentary*, April 2007.

[56] Weyl (1989) p. 26-27.

[57] Vernon (1982) 160-162, 178-179, 273; Richard Lynn, "The Intelligence of American Jews," *Personality and Individual Differences*, January 2004; Margaret E. Backman, "Patterns of Mental Abilities: Ethnic, Socioeconomic, and Sex Differences," *American Educational*

*Research Journal*, Winter 1972.

[58] Evidence that these low Jewish enrollments are due to meritocratic admissions factors rather than merely lack of possible applicants may be seen if we compare different UC campuses. Berkeley and UCLA are the most selective, and at those Jewish enrollment averages about 9.5% or about one-quarter the Asian total; meanwhile, Santa Cruz and Santa Barbara are much less selective, and the Jewish percentages are nearly twice as high and also close to the local Asian figures. Jewish enrollments are also very substantial at the lower-tier California State University system, with numbers being much higher both at CS Northridge than nearby UCLA and at San Diego State compared to UCSD. Large numbers of Jewish students also attend the schools in the lowest-tier community college system as well, such as Pierce College in the San Fernando Valley. If these Jewish students had had higher academic performance, most would almost certainly have selected the much more prestigious University of California campuses.

[59] Kimball A. Milton and Jagdish Mehra, *Climbing the Mountain: The Scientific Biography of Julian Schwinger*, 2003, p. 218.

[60] Weyl (1989) p. 26-27 estimates Jews as having a "performance coefficient" of 339 on the 1987 NMS semifinalist list. Since Jews were then approximately 2.4% of the American population, they would have been roughly 8.1% of the 1987 NMS semifinalists.

[61] David W. Murray, "The War Against Testing," *Commentary*, September 1998.

[62] California contains a large fraction of America's mainland Japanese-Americans, who represent approximately 1.1% of the state's population, while roughly 0.8% of the state's NMS semifinalists have Japanese surnames. However, the older mean age of this group implies that it probably represents a relatively reduced fraction of the high school population.

[63] Weyl (1966) pp. 53-54, 83-84.

[64] Most recently, Judge Richard Posner, one of America's most highly regarded jurists, made such a claim that Jews have a mean IQ of 115 on his blog, together with an even more absurd claim that the same was also true for Asian-Americans. See "Rating Teachers," The Becker-Posner Blog, September 23, 2012, http://www.becker-posner-blog.com/2012/09/rating-teachersposner.html .

[77] Hughes (2003) 49, 57-58.

[78] Karabel (2005) pp. 292, 311.

[79] Privacy considerations prevent the public release of information on honors degrees awarded to graduates, but the top 10% of each Harvard class is inducted into Phi Beta Kappa, the national honors society, and the university's PBK rosters of the last fifty years are available on the Internet: http://isites.harvard.edu/icb/icb.do?keyword=k19082&pageid=icb.page189954 . Thirty or forty years ago, Jewish names were very common on the PBK lists, but more recently they have dropped to fairly low levels. It appears that Harvard's non-Jewish whites are now perhaps five times as likely as their Jewish classmates to achieve such high academic performance, with Asian students doing nearly as well. See Appendix G.

In recent years, Jewish conservatives have often been in the forefront of accusations that ethnic favoritism leads elite academic institutions to unfairly admit large numbers of blacks and Hispanics, who subsequently underperform once on campus. But perhaps such critics should consider looking into a mirror.

[80] Karabel (2005) p. 667n95.

[81] Harvard's most recent presidents have been Neil Rudenstine (1991-2001), Larry Summers (2001-2006), and Drew Faust (2007-present); the first two were of Jewish ancestry, while the last has been married to Charles E. Rosenberg since 1980. Richard Levin has served as president of Yale since 1993, as did Harold Shapiro at Princeton (1988-2001), while the current presidents of Penn and Cornell are Amy Gutmann (2004-present), and David Skorton (2006-present) respectively, all of Jewish origins, as is Yale's newly named incoming president Peter Salovey. In addition, former NYC Mayor Ed Koch identified Columbia President Lee Bollinger (2002-present) as being of Jewish ancestry in an angry column regarding Iran, but I have been unable to independently verify that claim. See Ed Koch, "Columbia Prez Should Have Stood Up for America, Too," *Jewish World Review*, September 26, 2007.

[82] Princeton's last seven provosts have been Neil Rudenstine (1977-1987), Paul Benacerraf (1988-1991), Hugo Sonnenschein (1991-1993), Stephen Goldfeld (1993-1995), Jeremiah Ostriker (1995-2001), Amy Guttmann (2001-2004), and Christopher Eisgruber (2004-present), and all were of Jewish ancestry. Four of Harvard's last five provosts have had similar ethnicity, as well as three of three at Brown and two of five at Yale, including in each case the current officeholder.

[83] Fox Butterfield, "Harvard's "Core' Dean Glances Back," *The New York Times*, June 2, 1984.

[84] See Appendix D. It is also curious that the weighty 1998 defense of preferential ethnic admissions policies at elite institutions written by former Harvard President Derek Bok and former Princeton President William G. Bowen contains no mention whatsoever of the widespread claims of anti-Asian discrimination at their own institutions, and does not even include a single reference to "Jews" in their very detailed index. See Bowen (1998).

[85] Three of Caltech's most recent six presidents have been Harold Brown (1969-1977), Marvin Goldberger (1978-1987), and David Baltimore (1997-2006), all of Jewish ancestry. Two of MIT's most recent five presidents have been Jerome Wiesner (1971–1980) and Leo Reif (2012–present), who have the same ethnic background.

[86] Espenshade (2009) pp. 92-93.

[92] For example, Harvard President Derek Bok once denigrated the compensatory rational for affirmative action, instead praising "diversity" as "the hallmark" and the "core" of a university experience. As a positive instance of such "diversity," he cited the benefits of enrolling a friend of his who had served as a captain of the women's track team, and came from a background wealthy enough that she celebrated her birthday with a trip to Italy. �Princeton Tries to Explain a Drop in Jewish Enrollment,� *The Chronicle of Higher Education*, May 14, 1999; Caroline C. Pam, "Enrollment of Jews at Princeton Drops by 40% in 15 Years," *The New York Observer*, May 31, 1999; Karen W. Arenson, "Princeton Puzzle: Where Have Jewish Students Gone?," *The New York Times*, June 2, 1999. It should be noted that Princeton's president at the time was Harold Shapiro, of Jewish ancestry, and just a few years earlier, the university had opened a $4.5 million Center for Jewish Life. See Synnott (1979/2010) p. xxvi-xxvii.

[109] See William Lind, "The Origins of Political Correctness," February 5, 2000, Accuracy in Academia: http://www.academia.org/the-origins-of-political-correctness/ . Nearly all the figures mentioned were of Jewish origins.

[110] As discussed earlier, the recent accusations of Harvard racial discrimination from a rejected Asian applicant were denounced as "ludicrous" and "surreal" by the student editors of the *Harvard Crimson*, who emphasized the tremendous importance of affirmative action policies in maintaining student ethnic "diversity" at elite colleges and pointed out that Asians were anyway already over-represented by 200% relative to their portion of the American population. It so happens that the two top names on the *Crimson* masthead both came from an ethnic group over-represented at Harvard by nearly 1300%.

[111] For example, Bowen (1998) p. 37-39 attempts to compare the academic strength of black students admitted under affirmative action policies with the bottom decile of admitted white students, as a proxy for those whites rejected under affirmative action, and notes that the gap is smaller than often believed. The authors, former presidents of Harvard and Princeton, also emphasize that the crucial factor is to ensure that all admitted are above a high academic threshold and able to reasonably perform the work in question (p. 23). One obvious problem with this analysis is that if elite universities admit many under-qualified white students based on favoritism or corruption, these would constitute the bottom decile in question, and the comparison made would merely highlight this fact.

[112] Karabel (2005) p. 292.

[113] Klitgaard (1985) pp. 23-30.

[114] Hughes (2003) pp. 15, 49, 56. Also, in 1990 Harvard officials told federal investigators that 80-90% of applicants could probably do

the academic work and 50-60% could do superb work. See Takagi (1992/1998) p. 194.

[115] Lemann (1999) pp. 206-207.

[116] Examples of the extreme effort students take in building their resumes for elite college admissions purposes are discussed throughout Newport (2010) and Harvard Crimson Editors (2005).

[117] See for example Austin Bramwell, "Top of the Class," *The American Conservative*, March 13, 2012: http://www.theamericanconservative.com/articles/top-of-the-class/ .

[118] Quoted in Heather Higgins, "Remembering James Q. Wilson," *US News and World Report*, March 5, 2012: http://www.usnews.com/opinion/articles/2012/03/05/remembering-james-q-wilson .

[119] The quota provisions of the 1924 Immigration Act were based on the national origins of the existing American population and therefore required a detailed analysis of existing ethnicities, and the totals for 1920 are presented in Madison Grant, *Conquest of a Continent* (1933) pp. 278-280. Around that time, well over one-third of all Americans were of British ancestry, 80 percent were Protestant, and 85% of whites had origins in Northwestern Europe.

[120] Quoted in Kahlenberg (1996) p. 115.

# Our American Pravda

*The major media overlooked Communist spies and Madoff's fraud. What are they missing today?*

April 29, 2013 • 4,500 Words

In mid-March, the *Wall Street Journal* carried a long discussion of the origins of the Bretton Woods system, the international financial framework that governed the Western world for decades after World War II. A photo showed the two individuals who negotiated that agreement. Britain was represented by John Maynard Keynes, a towering economic figure of that era. America's representative was Harry Dexter White, assistant secretary of the Treasury and long a central architect of American economic policy, given that his nominal superior, Secretary Henry Morgenthau Jr., was a gentleman farmer with no background in finance. White was also a Communist agent.

Such a situation was hardly unique in American government during the 1930s and 1940s. For example, when a dying Franklin Roosevelt negotiated the outlines of postwar Europe with Joseph Stalin at the 1945 Yalta summit, one of his important advisors was Alger Hiss, a State Department official whose primary loyalty was to the Soviet side. Over the last 20 years, John Earl Haynes, Harvey Klehr, and other scholars have conclusively established that many dozens or even hundreds of Soviet agents once honeycombed the key policy staffs and nuclear research facilities of our federal government, constituting a total presence perhaps approaching the scale suggested by Sen. Joseph McCarthy, whose often unsubstantiated charges tended to damage the credibility of his position.

The Cold War ended over two decades ago and Communism has been relegated to merely an unpleasant chapter in the history books, so today these facts are hardly much disputed. For example, liberal *Washington Post* blogger Ezra Klein matter-of-factly referred to White as a "Soviet spy" in the title of his column on our postwar financial system. But during the actual period when America's government was heavily influenced by Communist agents, such accusations were widely denounced as "Red-baiting" or ridiculed as right-wing conspiracy paranoia by many of our most influential journalists and publications. In 1982 liberal icon Susan Sontag ruefully acknowledged that for decades the subscribers to the lowbrow *Readers Digest* had received a more realistic view of the world than those who drew their

knowledge from the elite liberal publications favored by her fellow intellectuals. I myself came of age near the end of the Cold War and always vaguely assumed that such lurid tales of espionage were wildly exaggerated. I was wrong.

The notion of the American government being infiltrated and substantially controlled by agents of a foreign power has been the stuff of endless Hollywood movies and television shows, but for various reasons such popular channels have never been employed to bring the true-life historical example to wide attention. I doubt if even one American in a hundred today is familiar with the name "Harry Dexter White" or dozens of similar agents.

The realization that the world is often quite different from what is presented in our leading newspapers and magazines is not an easy conclusion for most educated Americans to accept, or at least that was true in my own case. For decades, I have closely read the *New York Times*, the *Wall Street Journal*, and one or two other major newspapers every morning, supplemented by a wide variety of weekly or monthly opinion magazines. Their biases in certain areas had always been apparent to me. But I felt confident that by comparing and contrasting the claims of these different publications and applying some common sense, I could obtain a reasonably accurate version of reality. I was mistaken.

Aside from the evidence of our own senses, almost everything we know about the past or the news of today comes from bits of ink on paper or colored pixels on a screen, and fortunately over the last decade or two the growth of the Internet has vastly widened the range of information available to us in that latter category. Even if the overwhelming majority of the unorthodox claims provided by such non-traditional web-based sources is incorrect, at least there now exists the possibility of extracting vital nuggets of truth from vast mountains of falsehood. Certainly the events of the past dozen years have forced me to completely recalibrate my own reality-detection apparatus.

Thoughtful individuals of all backgrounds have undergone a similar crisis of confidence during this same period. Just a few months after 9/11 *New York Times* columnist Paul Krugman argued that the sudden financial collapse of the Enron Corporation represented a greater shock to the American system than the terrorist attacks themselves, and although he was widely denounced for making such an "unpatriotic" claim, I believe his case was strong. Although the name "Enron" has largely vanished from our memory, for years it

had ranked as one of America's most successful and admired companies, glowingly profiled on the covers of our leading business magazines, and drawing luminaries such as Krugman himself to its advisory board; Enron Chairman Kenneth Lay had been a top contender for Treasury secretary in President George W. Bush's administration. Then in the blink of an eye, the entire company was revealed to be an accounting fraud from top to bottom, collapsing into a $63 billion bankruptcy, the largest in American history. Other companies of comparable or even greater size such as WorldCom, Tyco, Adelphia, and Global Crossing soon vanished for similar reasons.

Part of Krugman's argument was that while the terrorist attacks had been of an entirely unprecedented nature and scale, our entire system of financial regulation, accounting, and business journalism was designed to prevent exactly the sort of frauds that brought down those huge companies. When a system fails so dramatically at its core mission, we must wonder which of our other assumptions are incorrect.

Just a few years later, we saw an even more sweeping near-collapse of our entire financial system, with giant institutions such as Fannie Mae, Freddie Mac, Bear Stearns, Lehman Brothers, Wachovia, and AIG falling into bankruptcy, and all our remaining major banks surviving only due to the trillions of dollars in government bailouts and loan guarantees they received. Once again, all our media and regulatory organs had failed to anticipate this disaster.

Or take the remarkable case of Bernie Madoff. His colossal investment swindle had been growing unchecked for over three decades under the very noses of our leading financial journalists and regulators in New York City, ultimately reaching the sum of $65 billion in mostly fictional assets. His claimed returns had been implausibly steady and consistent year after year, market crashes or not. None of his supposed trading actually occurred. His only auditing was by a tiny storefront firm. Angry competitors had spent years warning the SEC and journalists that his alleged investment strategy was mathematically impossible and that he was obviously running a Ponzi scheme. Yet despite all these indicators, officials did nothing and refused to close down such a transparent swindle, while the media almost entirely failed to report these suspicions.

In many respects, the non-detection of these business frauds is far more alarming than failure to uncover governmental malfeasance. Politics is a partisan team sport, and it is easy to imagine Democrats

or Republicans closing ranks and protecting their own, despite damage to society. Furthermore, success or failure in public policies is often ambiguous and subject to propagandistic spin. But investors in a fraudulent company lose their money and therefore have an enormous incentive to detect those risks, with the same being true for business journalists. If the media cannot be trusted to catch and report simple financial misconduct, its reliability on more politically charged matters will surely be lower.

The circumstances surrounding our Iraq War demonstrate this, certainly ranking it among the strangest military conflicts of modern times. The 2001 attacks in America were quickly ascribed to the radical Islamists of al-Qaeda, whose bitterest enemy in the Middle East had always been Saddam Hussein's secular Baathist regime in Iraq. Yet through misleading public statements, false press leaks, and even forged evidence such as the "yellowcake" documents, the Bush administration and its neoconservative allies utilized the compliant American media to persuade our citizens that Iraq's nonexistent WMDs posed a deadly national threat and required elimination by war and invasion. Indeed, for several years national polls showed that a large majority of conservatives and Republicans actually believed that Saddam was the mastermind behind 9/11 and the Iraq War was being fought as retribution. Consider how bizarre the history of the 1940s would seem if America had attacked China in retaliation for Pearl Harbor.

True facts were easily available to anyone paying attention in the years after 2001, but most Americans do not bother and simply draw their understanding of the world from what they are told by the major media, which overwhelmingly—almost uniformly—backed the case for war with Iraq; the talking heads on TV created our reality. Prominent journalists across the liberal and conservative spectrum eagerly published the most ridiculous lies and distortions passed on to them by anonymous sources, and stampeded Congress down the path to war.

The result was what my late friend Lt. Gen. Bill Odom rightly called the "greatest strategic disaster in United States history." American forces suffered tens of thousands of needless deaths and injuries, while our country took a huge step toward national bankruptcy. Economics Nobel Laureate Joseph Stiglitz and others have estimated that with interest the total long-term cost of our two recent wars may reach as high as $5 or $6 trillion, or as much as $50,000 per American household, mostly still unpaid. Meanwhile, economist Edward Wolff has calculated that the Great Recession and its aftermath cut the

personal net worth of the median American household to $57,000 in 2010 from a figure nearly twice as high three years earlier. Comparing these assets and liabilities, we see that the American middle class now hovers on the brink of insolvency, with the cost of our foreign wars being a leading cause.

But no one involved in the debacle ultimately suffered any serious consequences, and most of the same prominent politicians and highly paid media figures who were responsible remain just as prominent and highly paid today. For most Americans, reality is whatever our media organs tell us, and since these have largely ignored the facts and adverse consequences of our wars in recent years, the American people have similarly forgotten. Recent polls show that only half the public today believes that the Iraq War was a mistake.

Author James Bovard has described our society as an attention deficit democracy, and the speed with which important events are forgotten once the media loses interest might surprise George Orwell.

Consider the story of Vioxx, a highly lucrative anti-pain medication marketed by Merck to the elderly as a substitute for simple aspirin. After years of very profitable Vioxx sales, an FDA researcher published a study demonstrating that the drug greatly increased the risk of fatal strokes and heart attacks and had probably already caused tens of thousands of premature American deaths. Vioxx was immediately pulled from the market, but Merck eventually settled the resulting lawsuits for relatively small penalties, despite direct evidence the company had long been aware of the drug's deadly nature. Our national media, which had earned hundreds of millions of dollars in advertising revenue from Vioxx marketing, provided no sustained coverage and the scandal was soon forgotten. Furthermore, the press never investigated the dramatic upward and downward shifts in the mortality rates of elderly Americans that so closely tracked the introduction and recall of Vioxx; as I pointed out in a 2012 article, these indicated that the likely death toll had actually been several times greater than the FDA estimate. Vast numbers Americans died, no one was punished, and almost everyone has now forgotten.

Or take the strange case of Bernard Kerik, New York Mayor Rudolph Giuliani's police commissioner during 9/11, later nominated by President Bush to be America's first director of national intelligence, a newly established position intended to oversee all of our various national-security and intelligence agencies. His appointment seemed likely to sail through the Republican-controlled Senate until derailed by accusations he had employed an undocumented nanny. With his

political rise having been blocked, the national media suddenly revealed his long history of association with organized-crime figures, an indictment quickly followed, and he is currently still serving his federal prison sentence for conspiracy and fraud. So America came within a hairbreadth of placing its entire national-security apparatus under the authority of a high-school dropout connected with organized crime, and today almost no Americans seem aware of that fact.

Through most of the 20th century, America led something of a charmed life, at least when compared with the disasters endured by almost every other major country. We became the richest and most powerful nation on earth, partly due to our own achievements and partly due to the mistakes of others. The public interpreted these decades of American power and prosperity as validation of our system of government and national leadership, and the technological effectiveness of our domestic propaganda machinery—our own American *Pravda*—has heightened this effect. Furthermore, most ordinary Americans are reasonably honest and law-abiding and project that same behavior onto others, including our media and political elites. This differs from the total cynicism found in most other countries around the world.

Credibility is a capital asset, which may take years to accumulate but can be squandered in an instant; and the events of the last dozen years should have bankrupted any faith we have in our government or media. Once we acknowledge this, we should begin to accept the possible reality of important, well-documented events even if they are not announced on the front pages of our major newspapers. When several huge scandals have erupted into the headlines after years or decades of total media silence, we must wonder what other massive stories may currently be ignored by our media elites. I think I can provide a few possibilities.

Consider the almost forgotten anthrax mailing attacks in the weeks after 9/11, which terrified our dominant East Coast elites and spurred passage of the unprecedented Patriot Act, thereby eliminating many traditional civil-libertarian protections. Every morning during that period the *New York Times* and other leading newspapers carried articles describing the mysterious nature of the deadly attacks and the complete bafflement of the FBI investigators. But evenings on the Internet I would read stories by perfectly respectable journalists such as *Salon*'s Laura Rozen or the staff of the *Hartford Courant* providing a

wealth of additional detail and pointing to a likely suspect and motive.

Although the letters carrying the anthrax were purportedly written by an Arab terrorist, the FBI quickly determined that the language and style indicated a non-Arab author, while tests pointed to the bioweapons research facility at Ft. Detrick, Md., as the probable source of the material. But just prior to the arrival of those deadly mailings, military police at Quantico, Va., had also received an anonymous letter warning that a former Ft. Detrick employee, Egyptian-born Dr. Ayaad Assaad, might be planning to launch a national campaign of bioterrorism. Investigators quickly cleared Dr. Assaad, but the very detailed nature of the accusations revealed inside knowledge of his employment history and the Ft. Detrick facilities. Given the near-simultaneous posting of anthrax envelopes and false bioterrorism accusations, the mailings almost certainly came from the same source, and solving the latter case would be the easiest means of catching the anthrax killer.

Who would have attempted to frame Dr. Assaad for bioterrorism? A few years earlier he had been involved in a bitter personal feud with a couple of his Ft. Detrick coworkers, including charges of racism, official reprimands, and angry recriminations all around. When an FBI official shared a copy of the accusatory letter with a noted language-forensics expert and allowed him to compare the text with the writings of 40 biowarfare lab employees, he found a perfect match with one of those individuals. For years I told my friends that anyone who spent 30 minutes with Google could probably determine the name and motive of the likely anthrax killer, and most of them successfully met my challenge.

This powerful evidence received almost no attention in the major national media, nor is there any indication that the FBI ever followed up on any of these clues or interrogated the named suspects. Instead, investigators attempted to pin the attacks on a Dr. Steven Hatfill based on negligible evidence, after which he was completely exonerated and won a $5.6 million settlement from the government for its years of severe harassment. Later, similar hounding of researcher Bruce Ivins and his family led to his suicide, after which the FBI declared the case closed, even though former colleagues of Dr. Ivins demonstrated that he had had no motive, means, or opportunity. In 2008, I commissioned a major 3,000-word cover story in my magazine summarizing all of this crucial evidence, and once again almost no one in the mainstream media paid the slightest attention.

An even more egregious case followed a couple of years later, with regard to the stunning revelations of Pulitzer Prize winner Sydney Schanberg, one of America's foremost Vietnam War reporters and a former top editor at the *New York Times*. After years of research, Schanberg published massive evidence demonstrating that the endlessly ridiculed claims of America's Vietnam MIA movement of the 1970s and 1980s were correct: the Nixon administration had indeed deliberately abandoned many hundreds of American POWs in Vietnam at the close of the war, and our government afterward spent decades covering up this shameful crime. Schanberg's charges were publicly confirmed by two former Republican House members, one of whom had independently co-authored a 500 page book on the subject, exhaustively documenting the POW evidence.

Although a major focus of Schanberg's account was the central role that Sen. John McCain had played in leading the later cover-up, the national media ignored these detailed charges during McCain's bitter 2008 presidential campaign against Barack Obama. One of America's most distinguished living journalists published what was surely "the story of the century" and none of America's newspapers took notice.

In 2010 Schanberg republished this material in a collection of his other writings, and his work received glowing praise from Joseph Galloway, one of America's top military correspondents, as well as other leading journalists; his charges are now backed by the weight of four *New York Times* Pulitzer Prizes. Around that same time, I produced a 15,000-word cover-symposium on the scandal, organized around Schanberg's path-breaking findings and including contributions from other prominent writers. All of this appeared in the middle of Senator McCain's difficult reelection campaign in Arizona, and once again the material was totally ignored by the state and national media.

An argument might be made that little harm has been done to the national interest by the media's continued silence in the two examples described above. The anthrax killings have largely been forgotten and the evidence suggests that the motive was probably one of personal revenge. All the government officials involved in the abandonment of the Vietnam POWs are either dead or quite elderly, and even those involved in the later cover-up, such as John McCain, are in the twilight of their political careers. But an additional example remains completely relevant today, and some of the guilty parties hold high office.

During the mid-2000s I began noticing references on one or two small

websites to a woman claiming to be a former FBI employee who was making the most outlandish and ridiculous charges, accusing high government officials of selling our nuclear-weapons secrets to foreign spies. I paid no attention to such unlikely claims and never bothered reading any of the articles.

A couple of years went by, and various website references to that same woman—Sibel Edmonds—kept appearing, although I continued to ignore them, secure that the silence of all my newspapers proved her to be delusional. Then in early 2008, the London *Sunday Times*, one of the world's leading newspapers, ran a long, three-part front-page series presenting her charges, which were soon republished in numerous other countries. Daniel Ellsberg described Edmonds's revelations as "far more explosive than the Pentagon Papers" and castigated the American media for completely ignoring a story that had reached the front pages of newspapers throughout the rest of the world. Such silence struck me as rather odd.

Philip Giraldi, a former CIA official who regularly writes for this magazine, suggested he investigate her charges. He found her highly credible, and his 3,000-word article in *TAC* presented some astonishing but very detailed claims.

Edmonds had been hired by the FBI to translate wiretapped conversations of a suspected foreign spy ring under surveillance, and she had been disturbed to discover that many of these hundreds of phone calls explicitly discussed the sale of nuclear-weapons secrets to foreign intelligence organizations, including those linked to international terrorism, as well as the placement of agents at key American military research facilities. Most remarkably, some of the individuals involved in these operations were high-ranking government officials; the staffs of several influential members of Congress were also implicated. On one occasion, a senior State Department figure was reportedly recorded making arrangements to pick up a bag containing a large cash bribe from one of his contacts. Very specific details of names, dates, dollar amounts, purchasers, and military secrets were provided.

The investigation had been going on for years with no apparent action, and Edmonds was alarmed to discover that a fellow translator quietly maintained a close relationship with one of the key FBI targets. When she raised these issues, she was personally threatened, and after appealing to her supervisors, eventually fired.

Since that time, she has passed a polygraph test on her claims, testified under oath in a libel lawsuit, expanded her detailed charges in a 2009 *TAC* cover story also by Giraldi, and most recently published a book recounting her case. Judiciary Committee Senators Chuck Grassley and Patrick Leahy have publicly backed some of her charges, a Department of Justice inspector general's report has found her allegations "credible" and "serious," while various FBI officials have vouched for her reliability and privately confirmed many of her claims. But none of her detailed charges has ever appeared in any of America's newspapers. According to Edmonds, one of the conspirators routinely made payments to various members of the media, and bragged to his fellow plotters that "We just fax to our people at the *New York Times*. They print it under their names."

At times, Congressional Democratic staff members became interested in the scandal, and promised an investigation. But once they learned that senior members of their own party were also implicated, their interest faded.

These three stories—the anthrax evidence, the McCain/POW revelations, and the Sibel Edmonds charges—are the sort of major exposés that would surely be dominating the headlines of any country with a properly-functioning media. But almost no American has ever heard of them. Before the Internet broke the chokehold of our centralized flow of information, I would have remained just as ignorant myself, despite all the major newspapers and magazines I regularly read.

Am I absolutely sure that any or all of these stories are true? Certainly not, though I think they probably are, given their overwhelming weight of supporting evidence. But absent any willingness of our government or major media to properly investigate them, I cannot say more.

However, this material does conclusively establish something else, which has even greater significance. These dramatic, well-documented accounts have been ignored by our national media, rather than widely publicized. Whether this silence has been deliberate or is merely due to incompetence remains unclear, but the silence itself is proven fact.

A likely reason for this wall of uninterest on so many important issues is that the disasters involved are often bipartisan in nature, with both Democrats and Republicans being culpable and therefore equally eager to hide their mistakes. Perhaps in the famous words of Benjamin Franklin, they realize that they must all hang together or they will

surely all hang separately.

We always ridicule the 98 percent voter support that dictatorships frequently achieve in their elections and plebiscites, yet perhaps those secret-ballot results may sometimes be approximately correct, produced by the sort of overwhelming media control that leads voters to assume there is no possible alternative to the existing regime. Is such an undemocratic situation really so different from that found in our own country, in which our two major parties agree on such a broad range of controversial issues and, being backed by total media dominance, routinely split 98 percent of the vote? A democracy may provide voters with a choice, but that choice is largely determined by the information citizens receive from their media.

Most of the Americans who elected Barack Obama in 2008 intended their vote as a total repudiation of the policies and personnel of the preceding George W. Bush administration. Yet once in office, Obama's crucial selections—Robert Gates at Defense, Timothy Geither at Treasury, and Ben Bernanke at the Federal Reserve—were all top Bush officials, and they seamlessly continued the unpopular financial bailouts and foreign wars begun by his predecessor, producing what amounted to a third Bush term.

Consider the fascinating perspective of the recently deceased Boris Berezovsky, once the most powerful of the Russian oligarchs and the puppet master behind President Boris Yeltsin during the late 1990s. After looting billions in national wealth and elevating Vladimir Putin to the presidency, he overreached himself and eventually went into exile. According to the *New York Times*, he had planned to transform Russia into a fake two-party state—one social-democratic and one neoconservative—in which heated public battles would be fought on divisive, symbolic issues, while behind the scenes both parties would actually be controlled by the same ruling elites. With the citizenry thus permanently divided and popular dissatisfaction safely channeled into meaningless dead-ends, Russia's rulers could maintain unlimited wealth and power for themselves, with little threat to their reign. Given America's history over the last couple of decades, perhaps we can guess where Berezovsky got his idea for such a clever political scheme.

This was correct. However, President George W. Bush had nominated him to run America's Department of Homeland Security rather than to be America's Director of National Intelligence.]**

# Who Shot Down Flight MH17 in Ukraine?

August 14, 2014 • 1,600 Words

Last year I published Our American Pravda, making the case for the utter corruption and unreliability of the mainstream American media, both in the past and especially in recent years. The enormous lacunae I daily noticed in the pages of *The New York Times*, *The Wall Street Journal*, and other leading media outlets were a major motivation behind my creation of *The Review*, whose readership has grown enormously in recent weeks.

A perfect example of this dangerous MSM "conspiracy of silence" may be found in the growing confrontation with Russia over Ukraine, greatly accelerated by the death of almost 300 passengers aboard Malaysian Airlines Flight 17, shot down last month over Eastern Ukraine. The American media and its Western counterparts have almost unanimously placed the blame on anti-government rebels backed by Russia, and darkly insinuate that Russian President Vladimir Putin has the blood of those hundreds of innocent lives on his hands. London's once-respected *Economist* magazine has repeatedly run shrill covers promoting the great threat of Putin and Russia to world peace, even featuring a photo of the former under the stark title "A Web of Lies." There is the serious likelihood of a renewed Cold War against Russia and with the neoconized Republicans in Congress proposing legislation to incorporate Ukraine as an American military ally and deploy American forces there, the actual possibility of a military clash near the Russian border.

As readers know, I have been overwhelmingly consumed with my own software work in recent months and aside from closely reading the *NYT* and *WSJ* every morning, have devoted little time or effort to following the disastrous Ukraine situation. But just carefully reading between the lines of our elite MSM outlets and glancing at a few contrary perspectives presented on alternative websites have left me highly suspicious of our media narrative, leading me to wonder where the finger of guilt actually points.

For example, according to the official American story, MH17 was downed by rebels armed with a BUK anti-aircraft missile battery. As it happens, the pro-American Ukraine government possesses a large

inventory of exactly those weapons, while it is far from clear that the rebels have a single unit, let alone the expertise to operate such sophisticated devices. Furthermore, there apparently exists radar evidence demonstrating that Ukraine fighter planes were in the immediate vicinity of MH17 just before it was shot down and there are firsthand reports from investigators on the ground that portions of the crashed fuselage showed strong evidence of having been hit the sort of heavy machine-gun fire employed in air combat. I find it extremely suspicious that the American government has repeatedly refused to release the evidence supporting its own narrative, while the Russian government has released copious evidence backing the opposing perspective.

We must bear in mind that the downing of MH17 and the deaths of the hundreds of mostly European passengers came as a fortuitous stroke of fortune for the embattled Kiev government and its neoconservative American backers, given that Germany and most of the other major European governments had just balked at approving the harsh anti-Russian economic sanctions being proposed by the White House. *Cui bono*?

Furthermore, this terrible suspicion that 300 innocent lives may have been sacrificed in a ghastly false-flag operation by an American-supported government is somewhat buttressed by earlier events. Consider that the overthrow of the democratically-elected and neutralist Ukrainian government was sparked by the massive bloodshed that erupted between riot police and pro-American demonstrators in the Kievan capital, as many hundreds on both sides were suddenly killed or wounded by an outbreak of heavy gunfire over a couple of nights. I found it very intriguing that soon afterward an intercepted telephone call between the pro-Western foreign minister of Estonia and European High Commissioner Catherine Ashton, later confirmed to be genuine, revealed that the bullets found in the bodies of both government police and anti-government demonstrators had apparently come from the same guns. The most plausible explanation of this strange detail is that the snipers responsible were professionals brought in to cause the massive bloodshed necessary to overthrow the government, which is exactly what soon followed. Again *cui bono*?

Am I certain about these facts, let alone the analysis built upon them? Absolutely not! As emphasized, I've been entirely preoccupied with other matters over the last few months. But if such obvious suspicions are apparent to someone who occasionally glances at the news reports out of the corner of his mind's eye, the total silence of the American

media and its huge corps of full-time professional journalists constitutes a very telling indictment. Personally, I think there's a high likelihood that forces aligned with current pro-Western regime were responsible for the massacre in Kiev's Maidan Square and a better than fifty-fifty chance they more recently shot down MH17, but I really can't be sure about either of these things. However, I am absolutely 100% certain that the American MSM has been revealed as a totally worthless source of information on these crucial world events, although it can be relied upon to provide every last detail of Robin Williams' troubled life or the endless foibles of the Kardashians.

In the interests of providing our readers at least some access to alternate accounts of why we may now be heading into a new Cold War against Russia—or even a hot one— I've recently republished a couple of Mike Whitney's fine Counterpunch columns on the mysteries of Flight MH17, which cautiously raised questions rather than claimed to answer them, as well as those of the redoubtable Paul Craig Roberts.

Aside from attracting considerable debate from our website's often "excitable" commenters, whose views range from the sensible to the deranged, our Whitney columns regarding MH17 had a far more important consequence. One of our left-liberal readers was shocked to read facts totally absent from the pages of *The Nation*, the *Huffington Post*, or any of the other left-liberal sites she visits. Out of curiosity, she contacted a very prominent left-liberal American academic, someone with special expertise in exactly that area of Europe. To her considerable surprise, he largely confirmed the outlandish "conspiracy theory," saying that the evidence increasingly indicated that the American-backed Kiev government had shot down Flight MH17, either accidentally or otherwise.

Based on his remarks, it sounded like he and his friends had devoted 100x the time and effort that I had to investigating the incident, thereby reassuring me that my casual conclusions were at least not wholly ridiculous. Yet it also appeared that neither he or any of the other American experts in his circle who apparently share his views had seen fit to publish their opinions in any of the numerous media outlets to which they have easy access, presumably for fear of being denounced and stigmatized as "conspiracy nuts." They may regard the possibility of an American military confrontation with nuclear-armed Russia as a terrible danger, but it pales compared to the horrifying risk that the 22-year-old bookers at MSNBC chat shows might decide to put a black mark down next to their names.

The following day I lamented this cowardice of our *intelligentsia* to another prominent liberal academic with whom I'm friendly, and he immediately sent me the draft by a friend of his on that very topic that I am now greatly honored to publish. Most of the dead on MH17 were Dutch citizens and Karel van Wolferen ranks as one of the world's most prominent Dutch journalists, winner of major awards and someone whose numerous books that have sold well over a million copies worldwide. His article describes the evidence regarding MH17, but more importantly focuses on the totally corrupted worlds of journalism and politics that have enabled this dangerous situation to develop.

I urge everyone to read van Wolferen's long and thoughtful piece and ask themselves why such basic facts and simple analysis appear nowhere within the mainstream American media. Given his standing and his credibility, the *New York Times* should have long since featured his byline on a major opinion piece, and the absence constitutes powerful evidence. During our disastrous Iraq War the American media applied exactly the same boycott to the views of my old friend Bill Odom, the three-star general who had run the NSA for President Ronald Reagan and ranked as one of Washington's leading experts on national security issues. Our totally incompetent ruling elites refuse to let discordant voices puncture their bubble of unreality.

For those readers who refuse to admit the possibility that our vaunted MSM might conceal such vital facts, consider the important point I made at the beginning of my 2013 article. In recent years, leading scholars have conclusively established that for a decade or two during the 1930s and 1940s, a small network of Communist spies quietly gained substantial control of our national government in Washington, DC, successfully diverting the actions of the United States to their own nefarious ends. If our mainstream media had failed to notice or report that situation at the time and then spent the next half century ridiculing anyone who suggested this possibility, why should anyone believe that the media can be trusted on the question of who actually shot down Flight MH17 in Ukraine? Our American Pravda indeed.

- The Ukraine, Corrupted Journalism, and the Atlanticist Faith
  By Karel van Wolferen • August 14, 2014 • 3,900 Words

**UPDATE:** Our long, detailed article by distinguished Dutch journalist Karel van Wolferen has had enormous traffic, and is now on the verge of becoming the most heavily read piece in the history of our young webzine, while the nearly 600 Tweets it has so far received indicate

distribution comparable to that of a major New York Times article. All this has happened in just the last couple of days.

Furthermore, just as I had hoped, the very lengthy comment threads of the two articles have provided a wealth of additional information, far beyond anything I had previously encountered, given my slight familiarity with this issue.

First, I learned that a group of highly-experienced former intelligence officers from the CIA, FBI, NSA, and other government agencies has issued a public statement sharply criticizing the lack of evidence substantiating the claims made by American government officials.

http://www.noquarterusa.net/blog/77302/77302/#more-77302

Also, the blogsite of Col. Patrick Lang, a very highly regarded former Defense Intelligence official, has published a lengthy and detailed analysis of the MH17 Incident, raising many of the same issues:

http://turcopolier.typepad.com/sic_semper_tyrannis/2014/08/on-truth-and-honor-the-mh17-shootdown-and-the-centenary-of-world-war-i-.html#more

Furthermore, one of the commenters on our website, who purportedly has a military intelligence background, pointed us to the very detailed analysis he had published on his own blogsite regarding MH17:

http://ronaldthomaswest.com/2014/07/19/black-boxes-dark-arts-geopolitics/

And I also discovered that a prominent leftist journalist had also published a lengthy reconstruction of the shoot-down:

http://www.washingtonsblog.com/2014/08/systematically-reconstructing-shoot-malaysian-airliner-guilt-clear-damning.html

Although I claim no great expertise in military affairs, these analyses certainly seem to strengthen my suspicions that the Official Story almost universally accepted by the Western MSM is far from solid and may indeed be a ridiculous fabrication. I urge others to follow the links I have provided, and draw their own conclusions, perhaps different from my own. But they should ask themselves why so many highly-regarded former U.S. intelligence professionals would be raising these serious doubts and why our mainstream media has totally failed to report them.

As for me, I've noticed a curious fact. It appears that the people and organizations promoting the current Official Line on Ukraine have a huge overlap with the people and organizations that promoted the disastrous Iraq War, based on the notorious WMD Hoax. Meanwhile, the people providing serious skepticism about government accusations regarding MH17 are exactly the same people who raised doubts and skepticism about Iraq's alleged WMD and the wisdom of attacking Iraq, while being just as totally ignored by the MSM then as now.

Since none of the Iraq War or WMD Hoax culprits ever received proper punishment for their crimes, they've mostly remained alive and free and able to promote equally disastrous foreign policy adventures in the media they continue to control. But that doesn't mean we must be so gullible as to believe what they say.

Going forward, the crucial unknown is whether our timorous media or even its ideological fringes, will begin to seriously report these issues, or whether they'll all get into line just as they did during the WMD Hoax.

**UPDATE 2:**

Scott Horton has a podcast interview of Karel van Wolferen

# John McCain: When "Tokyo Rose" Ran for President

*What Was John McCain's True Wartime Record in Vietnam?*

March 09, 2015 • 4,200 Words

Although the memory has faded in recent years, during much of the second half of the twentieth century the name "Tokyo Rose" ranked very high in our popular consciousness, probably second only to "Benedict Arnold" as a byword for American treachery during wartime. The story of Iva Ikuko Toguri, the young Japanese-American woman who spent her wartime years broadcasting popular music laced with enemy propaganda to our suffering troops in the Pacific Theater was well known to everyone, and her trial for treason after the war, which stripped her of her citizenship and sentenced her to a long prison term, made the national headlines.

The actual historical facts seem to have been somewhat different than the popular myth. Instead of a single "Tokyo Rose" there were actually several such female broadcasters, with Ms. Toguri not even being the earliest, and their identities merged in the minds of the embattled American GIs. But she was the only one ever brought to trial and punished, although her own radio commentary turned out to have been almost totally innocuous. The plight of a young American-born woman alone on a family visit who became trapped behind enemy lines by the sudden outbreak of war was obviously a difficult one, and desperately taking a job as an English-language music announcer hardly fits the usual notion of treason. Indeed, after her release from federal prison, she avoided deportation and spent the rest of her life quietly running a grocery shop in Chicago. Postwar Japan soon became our closest ally in Asia and once wartime passions had sufficiently cooled she was eventually pardoned by President Gerald Ford and had her U.S. citizenship restored.

Despite these extremely mitigating circumstances in Ms. Toguri's particular case, we should not be too surprised at America's harsh treatment of the poor woman upon her return home from Japan. All normal countries ruthlessly punish treason and traitors, and these terms are often expansively defined in the aftermath of a bitter war. Perhaps in a topsy-turvy Monty Python world, wartime traitors would be given medals, feted at the White House, and become national

heroes, but any real-life country that allowed such insanity would surely be set on the road to oblivion. If Tokyo Rose's wartime record had launched her on a successful American political career and nearly gave her the presidency, we would know for a fact that some cruel enemy had spiked our national water supply with LSD.

The political rise of Sen. John McCain leads me to suspect that in the 1970s some cruel enemy had spiked our national water supply with LSD.

My earliest recollections of John McCain are vague. I think he first came to my attention during the mid-1980s, perhaps after 1982 when he won an open Congressional seat in Arizona or more likely once he was elected in 1986 to the U.S. Senate seat of retiring conservative icon Barry Goldwater. All media accounts about him seemed strongly favorable, describing his steadfastness as a POW during more than five grim years of torture by his Vietnamese jailers, with the extent of his wartime physical suffering indicated by the famous photo showing him still on crutches as he was greeted by President Nixon many months after his return from enemy captivity. I never had the slightest doubts about this story or his war-hero status.

Former POW John McCain on Crutches, Greeting President Richard Nixon

McCain's public image took a beating at the end of the 1980s when he

became one of the senators caught up in the Keating Five financial scandal, but he managed to survive that controversy unlike most of the others. Soon thereafter he became prominent as a leading national advocate of campaign finance reform, a strong pro-immigrant voice, and also a champion of normalizing our relations with Vietnam, positions that appealed to me as much as they did to the national media. By 2000 my opinion had become sufficiently favorable that I donated to his underdog challenge to Gov. George W. Bush in the Republican primaries of that year, and was thrilled when he did surprisingly well in some of the early contests and suddenly had a serious shot at the nomination. However, he then suffered an unexpected defeat in South Carolina, as the large block of local military voters swung decisively against him. According to widespread media reports, the main cause was an utterly scurrilous whispering campaign by Karl Rove and his henchmen, which even included appalling accusations that the great war-hero candidate had been a traitor in Vietnam. My only conclusion was that the filthy lies sometimes found in American politics were even worse than I'd ever imagined.

Although in the aftermath of the 9/11 attacks, I turned sharply against McCain due to his support for an extremely bellicose foreign policy, I never had any reason to question his background or his integrity, and my strong opposition to his 2008 presidential run was entirely on policy grounds: I feared his notoriously hot temper might easily get us into additional disastrous wars.

Everything suddenly changed in June 2008 when I read a long article by an unfamiliar writer on the leftist *Counterpunch* website. Shocking claims were made that McCain may never have been tortured and that he instead spent his wartime captivity collaborating with his captors and broadcasting Communist propaganda, a possibility that seemed almost incomprehensible to me given all the thousands of contrary articles that I had absorbed over the decades from the mainstream media. How could this one article on a small website be the truth about McCain's war record and everything else be total falsehood? The evidence was hardly overwhelming, with the piece being thinly sourced and written in a meandering fashion by an obscure author, but the claims were so astonishing that I made some effort to investigate the matter, though without any real success.

However, those new doubts about McCain were still in my mind a few months later when I stumbled upon Sidney Schanberg's massively documented expose about McCain's role in the POW/MIA cover up, a vastly greater scandal. This time I was presented with a mountain of

hard evidence gathered by one of America's greatest wartime journalists, a Pulitzer Prize winning former top editor at *The New York Times*. In the years since then, other leading journalists have praised Schanberg's remarkable research, now giving his conclusions the combined backing of four *New York Times* Pulitzer Prizes, while two former Republican Congressmen who had served on the Intelligence Committee have also strongly corroborated his account.

In 1993 the front page of the *New York Times* broke the story that a Politburo transcript found in the Kremlin archives fully confirmed the existence of the additional POWs, and when interviewed on the *PBS Newshour* former National Security Advisors Henry Kissinger and Zbigniew Brzezinski admitted that the document was very likely correct and that hundreds of America's Vietnam POWs had indeed been left behind. In my opinion, the reality of Schanberg's POW story is now about as solidly established as anything can be that has not yet received an official blessing from the American mainstream media. And the total dishonesty of that media regarding both the POW story and McCain's leading role in the later cover up soon made me very suspicious of all those other claims regarding John McCain's supposedly heroic war record. Our American Pravda is simply not to be trusted on any touchy topics.

I have no personal knowledge of the Vietnam War myself nor do I possess expertise in that area of history. But after encountering Schanberg's expose in 2008, I soon got in touch with someone having exactly those strengths, a Vietnam veteran who later became a professor at one of our military service academies. At first, he was quite cagey regarding the questions I raised, but once he had read through Schanberg's lengthy article, he felt he could respond more freely and he largely confirmed the claims, partly based on certain information he personally possessed. He said he found it astonishing that in these days of the Internet the POW scandal had not attracted vastly more attention, and he couldn't understand why the media was so uniformly unwilling to touch the topic.

He also had some very interesting things to say about John McCain's wartime record. According to him, it was hardly a secret in veterans' circles that McCain had spent much of the war producing Communist propaganda broadcasts since these had regularly been played in the prisoner camps as a means of breaking the spirits of those American POWs who resisted collaboration. Indeed, he and some of his friends had speculated about who currently possessed copies of McCain's damning audio and video tapes and wondered whether they might come out during the course of the presidential campaign. Over the

years, other Vietnam veterans have publicly leveled similar charges, and Schanberg had suggested that McCain's leading role in the POW cover up might have been connected with the pressure he faced due to his notorious wartime broadcasts.

In late September 2008 another fascinating story appeared in my morning *New York Times*. An intrepid reporter decided to visit Vietnam and see what McCain's former jailers thought of the possibility that their onetime captive might soon reach the White House, that the man they had spent years brutally torturing could become the next president of the United States. To the journalist's apparent amazement, the former jailers seemed enthusiastic about the prospects of a McCain victory, saying that they hoped he would win since they had become such good friends during the war and had worked so closely together; if they lived in America, they would certainly all vote for him. When asked about McCain's claims of "cruel and sadistic" torture, the head of the guard unit dismissed those stories as being just the sort of total nonsense that politicians, whether in America or in Vietnam, must often spout in order to win popularity. A *BBC* correspondent reported the same statements.

Let us consider the implications of this story. Throughout his entire life John McCain has been notable for having a very violent temper and also for holding deep grudges. How plausible does it seem that the men who allegedly spent years torturing him would be so eager to see him reach a position of supreme world power?

But what about the famous photo, showing McCain still on crutches even months after his release from captivity? In early September 2008, someone discovered archival footage from a Swedish news crew which had filmed the return of the POWs, and uploaded it to YouTube. We see a healthy-looking John McCain walking off the plane from Vietnam, having a noticeable limp but certainly without any need of crutches. After returning home he had eventually entered Bethesda Naval Hospital for corrective surgery on some of his wartime injuries, and that recent American surgery was what explained his crutches in the photo with Nixon.

It is certainly acknowledged that considerable numbers of American POWs were indeed tortured in Vietnam, but it is far from clear that McCain was ever one of them. As the original *Counterpunch* article pointed out, throughout almost the entire war McCain was held at a special section for the best-behaving prisoners, which was where he allegedly produced his Communist propaganda broadcasts and perhaps became such good friends with his guards as they later claimed. Top-ranking former POWs held at the same prison, such as Colonels Ted Guy and Gordon "Swede" Larson, have gone on the record saying they are very skeptical regarding McCain's claims of torture.

I have taken the trouble to read through John McCain's earliest claims of his harsh imprisonment, a highly detailed 12,000 word first person account published under his name in *U.S. News & World Report* in May 1973, just a few weeks after his release from imprisonment. The editorial introduction notes the "almost total recall" seemingly demonstrated by the young pilot just out of captivity, and portions of the story strike me as doubtful, perhaps drawn from the long history of popular imprisonment fiction stretching back to Dumas's *Count of Monte Cristo*. Would a young navy pilot so easily develop and remember a "tap code" to extensively communicate with others across thick prison walls? And McCain describes himself as having a "philosophical bent," spending his years of solitary confinement

reviewing in his head all the many history books he had read, trying to make sense of human history, a degree of intellectualizing never apparent in his life either before or after.

One factual detail, routinely emphasized by his supporters, is his repeated claim that except for signing a single written statement very early in his captivity and also answering some questions by a visiting French newsman, he had staunchly refused any hint of collaboration with his captors, despite torture, solitary confinement, endless threats and beatings, and offers of rewards. Perhaps. But that original *Counterpunch* article provided the link to the purported text of one of McCain's pro-Hanoi propaganda broadcasts as summarized in a 1969 *UPI* wire service story, and I have confirmed its authenticity by locating the resulting article that ran in *Stars & Stripes* at the same time. So if crucial portions of McCain's account of his imprisonment are seemingly revealed to be self-serving fiction, how much of the rest can we believe? If his pro-Communist propaganda broadcasts were so notable that they even reached the news pages of one of America's leading military publications, it seems quite plausible that they were as numerous, substantial, and frequent as his critics allege

When I later discussed these troubling matters with an eminent political scientist who has something of a military background, he emphasized that McCain's history can only be understood in the context of his father, a top-ranking admiral who then served as commander of all American forces in the Pacific Theater, including our troops in Vietnam. Indeed, the alleged headline of the *UPI* wire story had been "PW [Prisoner of War] Songbird Is Pilot Son of Admiral," highlighting that connection. Obviously, for reasons both of family loyalty and personal standing it would have been imperative for John McCain's father and namesake to hush up the terrible scandal of having had his son serve as a leading collaborator and Communist propagandist during the war and his exalted rank gave him the power to do so. Furthermore, just a few years earlier the elder McCain had himself performed an extremely valuable service for America's political elites, organizing the official board of inquiry that whitewashed the potentially devastating "Liberty Incident," with its more than 200 dead and wounded American servicemen, so he certainly had some powerful political chits he could call in.

Placed in this context, John McCain's tales of torture make perfect sense. If he had indeed spent almost the entire war eagerly broadcasting Communist propaganda in exchange for favored treatment, there would have been stories about this circulating in private, and fears that these tales might eventually reach the

newspaper headlines, perhaps backed by the hard evidence of audio and video tapes. An effective strategy for preempting this danger would be to concoct lurid tales of personal suffering and then promote them in the media, quickly establishing McCain as the highest profile victim of torture among America's returned POWs, an effort rendered credible by the fact that many American POWs had indeed suffered torture.

Once the public had fully accepted McCain as our foremost Vietnam war-hero and torture-victim, any later release of his propaganda tapes would be dismissed as merely proving that even the bravest of men have their breaking point. Given that McCain's father was one of America's highest-ranking military officers and both the Nixon Administration and the media had soon elevated McCain to a national symbol of American heroism, there would have been enormous pressure on the other returning POWs, many of them dazed and injured after long captivity, not to undercut such an important patriotic narrative. Similarly, when McCain ran for Congress and the Senate a decade or so later, stories of his torture became a central theme of his campaigns and once again constituted a powerful defense against any possible rumors of his alleged "disloyalty."

And so the legend grew over the decades until it completely swallowed the man, and he became America's greatest patriot and war hero, with almost no one even being aware of the Communist propaganda broadcasts that had motivated the story in the first place. I have sometimes noticed this same historical pattern in which fictional accounts originally invented to excuse or mitigate some enormous crime may eventually expand over time until they totally dominate the narrative while the original crime itself is nearly forgotten. The central theme of McCain's presidential campaign was his unmatched patriotism and when he went down to defeat at the hands of Barack Obama, the widespread verdict was that even the greatest of war-heroes may still lose an election.

I must reemphasize that I am not an expert on the Vietnam War and my cursory investigation is nothing like the sort of exhaustive research that would be necessary to establish a firm conclusion on this troubling case. I have merely tried to provide a plausible account of McCain's war record and highlight some of the important pieces of evidence that a more thorough researcher should consider. Unlike the documentation of the POW cover up accumulated by Schanberg and others, which I regard as overwhelmingly conclusive, I think the best that may be said about my reconstruction of McCain's wartime history is that it seems more likely correct than not. However, I should

mention that when I discussed some of these items with Schanberg in 2010 and suggested that John McCain had been the Tokyo Rose of the Vietnam War, he considered it a very apt description.

John McCain is hardly the only prominent political figure whose problematic Vietnam War activities have at times come under harsh scrutiny but afterwards been airbrushed away and forgotten by our subservient corporate media. Just as McCain was widely regarded as the most prominent Republican war-hero of that conflict, his Democratic counterpart was probably Vietnam Medal of Honor winner Bob Kerrey, a former Nebraska governor and senator who had run for president in 1992 and then considered doing so again in the late 1990s.

His seemingly unblemished record of wartime heroism suddenly collapsed in 2001 with the publication of a devastating 8,000 word expose in *The New York Times Magazine* together with a *Sixty Minutes II* television segment. Detailed eyewitness testimony and documentary evidence persuasively established that Kerrey had ordered his men to massacre over a dozen innocent Vietnamese civilians—women, children, and infants—for being witnesses to his botched SEAL raid on a tiny Vietnamese hamlet, an action that somewhat recalled the infamous My Lai massacre of the previous year, though certainly on a much smaller scale. Kerrey's initial response to these horrific accusations—that his memory of the incident was "foggy"—struck me as near-certain proof of his guilt, and others drew similar conclusions.

As a supposed war-hero and a moderate Democrat, Kerrey had always been very popular in political circles, but even the once-friendly *New Republic* was shocked by the alacrity with which pundits and the media sought to absolve him of his apparent crimes. The revelations also seem to have had no impact on his tenure as president of the prestigious New School in New York, an academic institution with an impeccable liberal reputation, which he held for another decade before leaving to make an unsuccessful attempt to recapture his old Senate seat in Nebraska. Bob Dreyfuss, a principled left-liberal journalist, might still characterize him as a "mass murderer" in a 2012 blog post at *The Nation*, but for years almost no one in the mainstream media had ever alluded to the incident in any of the articles mentioning Kerrey's activities, just as the media also totally ignored all of Schanberg's remarkable revelations.  I suspect that Kerrey's war crimes have almost totally vanished from public

consciousness.

We must always draw an important distinction between the actions of individual journalists and the behavior of the American media taken as a whole. I believe that the overwhelming majority of reporters and editors are honest and sincere, and although their coverage may sometimes be slanted or mistaken, they do seek to inform rather than to mislead. Consider how many of the explosive facts discussed above or in Schanberg's massive expose were drawn directly from the *New York Times* and other leading media outlets. But after those crucial stories run, the facts they have established often seem to vanish from subsequent coverage, causing them to be forgotten by most casual readers. Thus, the detailed account of Kerrey's apparent massacre of civilians received the greatest possible initial coverage—a huge cover story in *The New York Times Magazine* and a top-rated *CBS News* television segment—but within a year or so the history had seemingly been flushed down the memory hole by almost all political reporters. The facts are still available for interested readers to uncover, but they must do the work themselves rather than simply relying on the summary narratives produced by mainstream publications.

The realization that many of our political leaders may be harboring such terrible personal secrets, secrets that our media outlets regularly conceal, raises an important policy implication independent of the particular secrets themselves. In recent years I have increasingly begun to suspect that some or even many of our national leaders may occasionally make their seemingly inexplicable policy decisions under the looming threat of personal blackmail, and that this may have also been true in the past.

Consider the intriguing case of J. Edgar Hoover, who spent nearly half a century running our domestic intelligence service, the FBI. Over those many decades he accumulated detailed files on vast numbers of prominent people and most historians agree that he regularly used such highly sensitive material to gain the upper hand in disputes with his nominal political masters and also to bend other public figures to his will. Meanwhile, he himself was hardly immune from similar pressures. These days it is widely believed that Hoover lived his long life as a deeply closeted homosexual and there are also serious claims that he had some hidden black ancestry, a possibility that seems quite plausible to me given his features. Such deep personal secrets may be connected with Hoover's long denials that organized crime actually existed in America and his great reluctance to allocate significant FBI resources to combat it.

Today when we consider the major countries of the world we see that in many cases the official leaders are also the leaders in actuality: Vladimir Putin calls the shots in Russia, Xi Jinping and his top Politburo colleagues do the same in China, and so forth. However, in America and in some other Western countries, this seems to be less and less the case, with top national figures merely being attractive front-men selected for their popular appeal and their political malleability, a development that may eventually have dire consequences for the nations they lead. As an extreme example, a drunken Boris Yeltsin freely allowed the looting of Russia's entire national wealth by the handful of oligarchs who pulled his strings, and the result was the total impoverishment of the Russian people and a demographic collapse almost unprecedented in modern peacetime history.

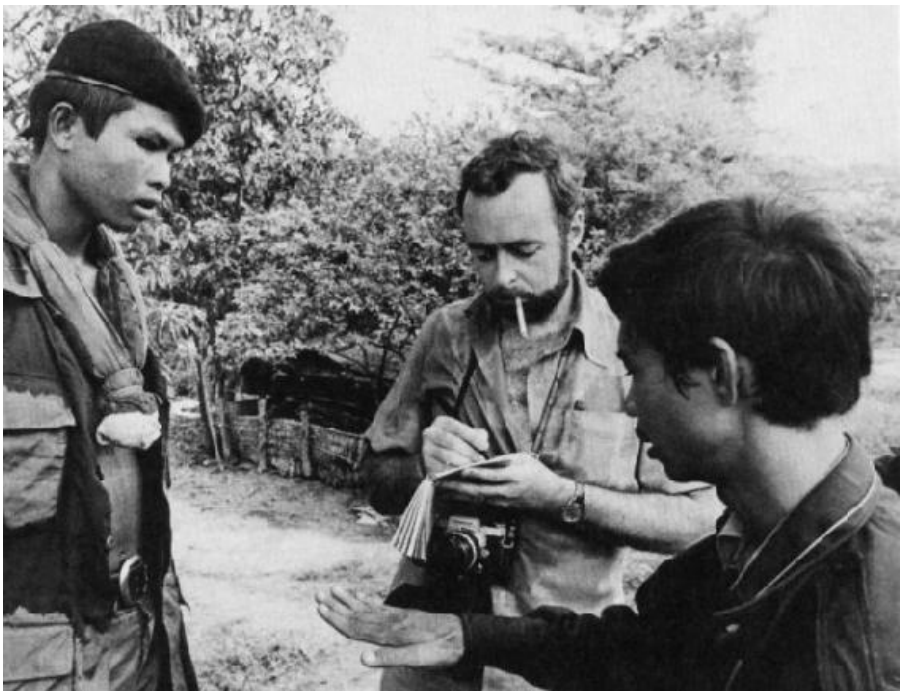
An obvious problem with installing puppet rulers is the risk that they will attempt to cut their strings, much like Putin soon outmaneuvered and exiled his oligarch patron Boris Berezovsky. One means of minimizing such risk is to select puppets who are so deeply compromised that they can never break free, knowing that the political self-destruct charges buried deep within their pasts could easily be triggered if they sought independence. I have sometimes joked with my friends that perhaps the best career move for an ambitious young politician would be to secretly commit some monstrous crime and then make sure that the hard evidence of his guilt ended up in the hands of certain powerful people, thereby assuring his rapid political rise.

Such notions may seem utterly absurd, but let us step back and consider recent American history. Just a few years ago an individual came very close to reaching the White House almost entirely on the strength of his war record, a war record that considerable evidence suggests was actually the sort that would normally get a military man hanged for treason at the close of hostilities. I have studied many historical eras and many countries and no parallel examples come to mind.

Perhaps the cause of this bizarre situation merely lies in the remarkable incompetence and cowardice of our major media organs, their herd mentality and their insouciant unwillingness to notice evidence that is staring them in the face. But we should also at least consider the possibility of a darker explanation. If Tokyo Rose had nearly been elected president in the 1980s, we would assume that the American political system had taken a very peculiar turn.

# The Legacy of Sydney Schanberg

July 13, 2016 • 3,500 Words



*Sydney H. Schanberg, center, in Cambodia, August 1973*

The death on Saturday of Sydney Schanberg at age 82 should sadden us not only for the loss of one of our most renowned journalists but also for what his story reveals about the nature of our national media.

Syd had made his career at the *New York Times* for 26 years, winning a Pulitzer Prize, two George Polk Memorial awards, and numerous other honors. His passing received the notice it deserved, with the world's most prestigious broadsheet devoting nearly a full page of its Sunday edition to his obituary, a singular honor that in this degraded era is more typically reserved for leading pop stars or sports figures. Several photos were included of his Cambodia reporting, which had become the basis for the Oscar-winning film *The Killing Fields*, one of Hollywood's most memorable accounts of our disastrous Indo-Chinese War.

But for all the 1,300 words and numerous images charting his long and illustrious journalistic history, not even a single mention was

made of the biggest story of his career, which has seemingly vanished down the memory hole without trace.  And therein lies a tale.

Could a news story ever be "too big" for the media to cover?  Every journalist is always seeking a major expose, a piece that not merely reaches the transitory front pages but also might win a journalistic prize or even change the history books.  Stories such as these appear rarely but can make a reporter's career, and it is difficult to imagine a writer turning one down, or an editor rejecting it.

But what if the story is *so* big that it actually reveals dangerous truths about the real nature of the American media, portrays too many powerful people in a very negative light, and perhaps leads to a widespread loss of faith in our major news media?  If readers were to see a story like that, they might naturally begin to wonder "why hadn't we ever been told?" or even "what else might be out there?"

Towards the end of the 2008 presidential campaign, while John McCain battled Barack Obama for the White House, I clicked an intriguing link on a small website and discovered Syd's remarkable expose, one which had been passed over or rejected by every major media outlet in the country, his enormous personal reputation notwithstanding.

The basic outline of events he described was a simple one.  During the Paris Peace Talks that ended the Vietnam War, the U.S. government had committed to pay its Hanoi adversaries $3.25 billion in war reparations, and in exchange would receive back the American POWs held by the Vietnamese.  The agreement was signed and the war officially ended, but the Vietnamese, suspecting a possible financial double-cross, kept back many hundreds of the imprisoned Americans until they received the promised payment.

For domestic political reasons, the Nixon Administration had characterized the billions of dollars pledged as "humanitarian assistance" and Congress balked at appropriating such a large sum for a hated Communist regime.  Desperate for "peace with honor" and already suffering under the growing Watergate Scandal, Nixon and his aides could not admit that many hundreds of the POWs remained in enemy hands, and so declared them all returned, probably hoping to quietly arrange a trade of money for prisoners once the dust had settled.  Similarly, Hanoi's leaders falsely claimed that all the captives had been released, while they waited for their

money to be paid. As a result, the two governments had jointly created a Big Lie, one which has largely maintained itself right down to the present day.

In the troubled aftermath of America's military defeat and the Nixon resignation, our entire country sought to forget Vietnam, and neither elected officials nor journalists were eager to revisit the issue, let alone investigate one of the war's dirtiest secrets. The Vietnamese continued to hold their American prisoners for most of the next twenty years, periodically making attempts to negotiate their release in exchange for the money they were still owed, but never found a American leader daring enough to take such a bold step. The Big Lie had grown just too enormous to be overturned.

Over the years, rumors surrounding the remaining POWs became widespread in veterans' circles, and eventually these stories inspired a series of blockbuster Hollywood movies such as *Rambo*, *Missing in Action*, and *Uncommon Valor*, whose plots were all naturally dismissed or ridiculed as "rightwing conspiracy theories" by our elite media pundits. But the stories were all true, and even as American filmgoers watched Sylvester Stallone heroically free desperate American servicemen from Vietnamese prisons, the real-life American POWs were still being held under much those same horrible conditions, with no American leader willing to take the enormous political risk of attempting either to rescue or ransom them. Over the years, many of the POWs had died from ill-treatment, and the return of the miserable survivors after their secret captivity would unleash a firestorm of popular anger, surely destroying the many powerful individuals who had long known of their abandonment.

Eventually, America's bipartisan political leadership sought to reestablish diplomatic relations with Hanoi and finally put the Vietnam War behind the country, but this important policy goal was obstructed by the residual political pressure from the resolute POW families. So a Senate Select Committee on the POWs was established in order to declare their non-existence once and for all. Sen. John McCain, a very high profile former POW himself, led the cover-up, perhaps because the very dubious nature of his own true war record left him eager to trade secrecy for secrecy. Despite considerable evidence to the contrary, our media declared that the abandoned POWs had never existed and closed the books on the long, lingering controversy.

As it happens, not long after the committee issued its final report and shut down, a stunning document was unearthed in the newly-opened

Kremlin archives. In the transcript of a Hanoi Politburo meeting, the Communist leadership discussed the true number of POWs they then held and made their decision to keep half of them back to ensure that America paid the billions of dollars it had promised. Former National Security Advisors Zbigniew Brzezinski and Henry Kissinger both stated on national television that the document appeared genuine and it seemed undeniable that American POWs had indeed been left behind. Although the national media devoted a couple of days of major coverage to this uncomfortable revelation, it then reported denials from both the U.S. and Vietnamese governments, and quickly dropped the story, returning to the official narrative: There were no abandoned POWs and never had been.

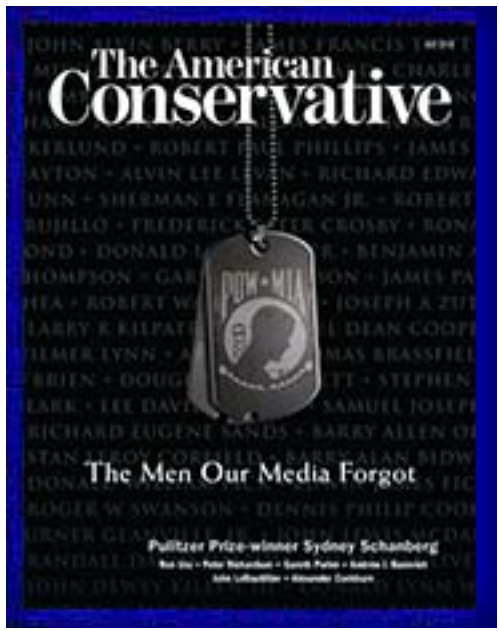
As I reviewed Syd's massively-documented 8,000 word exposition, and confirmed for myself that the bylined Sydney Schanberg was indeed *the* Sydney Schanberg, I experienced a growing sense of unreality. I was reading what might rank as "the story of the century," a scandal vastly greater and more gripping than the sordid political abuses of Watergate or Iran-Contra, a tale of national treachery suppressed for forty years by our government and our media, but now broken by one of America's most distinguished journalists. The gravest possible charges were being levied against Sen. John McCain, the Republican nominee, coming right at the height of his presidential campaign. And not one word of this was being mentioned in any of our mainstream media outlets, while almost all of the thousands of political websites, large and small alike, remained just as silent. From that day forward, I have never looked upon our national media with the same eye.

Everyone to whom I showed the article was just as shocked as myself, except for one or two individuals with a strong Vietnam War background, who privately confirmed that it was all probably true.

The election came and went with McCain's defeat, and the incoming Obama Administration began coping with the intensifying financial crisis, but I still couldn't put Syd's remarkable article out of my mind, nor the deafening silence it had received. Perhaps, I thought to myself, the piece had been ignored because it appeared on a small website with few readers, and the unprepossessing circumstances of its release had raised serious doubts about its credibility.

At that time I served as publisher of *The American Conservative*, a small but generally well-regarded opinion magazine, and I eventually

decided to commit my publication to providing the story the wider attention it so obviously deserved. By October I had gotten in touch with Syd, and spent several hours with him on the phone, explaining my interest, gaining his trust, and also assuring myself that he was still just as solid and sober a journalist as he had always been. I began preparations to republish his long expose as the cover story of one of my issues, making it the centerpiece of a symposium on government cover-ups and media lapses, with a special focus on the POW issue.



As part of that plan, I recruited a number of strong participants for the symposium, including Andrew Bacevich, the well-known military writer, the late Alex Cockburn, and even a former Republican House Member, who had independent evidence confirming the POW facts. Syd wrote a 2,000 word introductory piece entitled "Silent Treatment," recounting his unsuccessful efforts to persuade any mainstream media outlet to investigate the scandal, and I added an introduction, providing my own perspective on the story and its implications.

My magazine had tens of thousands of regular readers, and with the story's prestigious placement and Syd's stature bolstered by the symposium contributors, I felt confident we would attract a great deal of mainstream attention. I was on friendly terms with quite a number of established reporters and opinion columnists, and sent them advance copies of the material, speaking with some of them by phone, and discovering that all were as shocked by Syd's revelations as I had

been. Yet the result once again was utter and complete silence from mainstream media outlets, and no response to any of my follow-up notes. I was later told that one of America's best-known investigative reporters read the story and found it stunning, yet he never said a word about it in public.

Although totally boycotted by the establishment media, the article and the related pieces were heavily discussed and reviewed on several popular alternative media websites, left, right, and libertarian, so the facts must have come to the attention of many of the regular journalists who frequent those sources of information, and the cover story of our very next issue provoked considerable mainstream coverage. But Syd's "scandal of the century" had seemingly vanished into the ether.

Not long afterward, Syd published a collection of his articles in book form, with his McCain/POW expose being one of the last and longest pieces. David Rohde, a two-time Pulitzer Prize winning war reporter then at *The New York Times*, described the outstanding journalism contained within, writing that "Sydney Schanberg is one of the greatest war correspondents of the twentieth century," and the praise from Pulitzer Prize winner Russell Baker was equally fulsome. Joseph Galloway, a journalist who had authored major books on the Vietnam War, explicitly contrasted Syd's integrity with the shameful reticence of nearly all other journalists who failed to acknowledge the reality of America's hundreds of abandoned Vietnam POWs. So the historical truth seems to be known and generally accepted within informed circles, but no mainstream publication has been willing to allow it to reach the eyes or ears of the general population.

I do believe that the evidence is simply overwhelming to anyone with an open mind, and the universal silence of our media is the only slight contrary indicator. A few months ago I served on a government secrecy panel with Daniel Ellsberg, whose role in leaking the Pentagon Papers had established him one of America's leading voices on cover-ups of embarrassing military secrets. A major portion of my talk focused on Syd's POW findings, and the way in which the government and media had successfully colluded to keep the story hidden for over four decades. Ellsberg found the claims totally astonishing, and saying he'd never previously heard a word about them, eagerly took home copies of the article and some related material. At the dinner reception the next evening, he told me he'd carefully read them, and was fully convinced that everything was probably true.

At one point I also received a note from an elderly, rather prominent

mainstream conservative academic. He told me that at the end of the Vietnam War he had been a young intelligence officer in Washington, and even after all these decades the abandonment of American POWs still made him sick to his stomach. He said he hoped that someday there might be a U.S. President willing to tell the American people the truth of what had actually happened. I asked him for permission to publish his remarks, even anonymously, but got no reply.

Syd had always believed that the American media was simply scared of his story, with its troubling implications, and I tend to agree with him. Just as the government has maintained its cover-up for all these years because admitting the truth would destroy too many reputations, crucial elements of the media may feel the same way. There is the famous precedent of Pulitzer Prize winning *New York Times* correspondent Walter Duranty, whose reports from the Soviet Union regularly ridiculed claims of any significant Ukrainian famine during the 1930s and thereby helped ensure that nearly all of America's elite media discounted and ignored the reports that millions were dying. The *Times* took nearly sixty years before finally admitting its error.

And the cautious and hierarchical structure of mainstream journalism probably produces a cascading effect. The editor of any media outlet who might consider covering the POW scandal would naturally conclude that "it can't possibly be true or it would have already reached the headlines of one of America's leading publications." Meanwhile, the editors of any one of those latter outlets would note Syd's 26 years as a star journalist at the *New York Times*, and wonder why our national newspaper of record would be ignoring the story if it had any substantial basis in reality. And perhaps the editors making such decisions at the august *Times* itself would be ashamed to admit that they had completely ignored the facts for so long. A story which is "hot" will surely boost a journalist's career, but one which is "too hot" might risk destroying it.

Sometimes lower-ranking individuals are reluctant to stick their necks out on something so explosive, or even to trouble their superiors on the matter. Syd once told me that some years ago, he had dinner at his home with a retired Executive Editor of the *Times*, who was astonished to learn of the explosive POW findings, and dismayed that his own newspaper had never covered any of it at the time. "Why didn't you come to me yourself?," he asked. Syd responded that he considered it inappropriate to make a personal appeal for coverage on a story of such great significance, and that the material should stand or fall on its own journalistic merits. They parted with some angry

words.

The historical events under discussion took place over forty years ago, and I am sure that many would suggest that they have little relevance today. I was just a child when the Vietnam War ended, and barely have a memory of it. The American troops deliberately left behind to die by our own government numbered less than one percent of their comrades who fell in battle, and merely the tiniest sliver of the millions of overall fatalities in that misbegotten war.

But I have never believed that Syd's remarkable findings would significantly alter our view of the Vietnam War or even of our political leadership. The meaningful issue is not whether the Vietnamese Communists held our prisoners for ransom or whether American leaders sought to escape embarrassment by hiding that reality, but rather whether our supposedly free and vibrant mainstream press can be trusted on anything important, with a cover-up of such length and magnitude suggesting a negative conclusion. I think it would be an important and absolutely fascinating exercise for some enterprising media journalist to go around to a considerable number of the appropriate editors and reporters, bring them face to face with Syd's remarkable findings, and ask them what did they know, when did they know it, and why did none of them ever decide to report it?

The media is an enormously powerful and shaping force in our society, and receives far less scrutiny than it should. Taken together, it constitutes the sensory organs of the body politic, and if these grow unreliable, the results for our society can be disastrous, just as an animal in the wild with failing eyesight must surely face its doom.

Twelve months ago I would have been quite pessimistic that Syd's revelations might reach the media headlines in the foreseeable future, but today a confluence of independent factors may have made that a real possibility.

Most pundits have been flummoxed by the recent rise of Donald Trump and Bernie Sanders, whose repeated victories over their establishmentarian opponents seemed to violate every rule of modern political campaigns. But I think the obvious explanation is the visceral, burning hatred of so many Americans, both left and right, toward what they perceive to be the total dishonesty and corruption of their reigning political and media elites.

Last year I published an article gathering together the limited available evidence concerning John McCain's true wartime record, and demonstrating that it seemed at utter variance with that presented by the media. In many respects, my piece was a coda to Syd's own POW expose, and I was gratified at the very kind words he extended to my work. John McCain is currently up for reelection in Arizona this year and deeply unpopular, with the latest poll putting him at below 40% in his own Republican primary.

Much of my analysis had focused on the strong indications that McCain spent nearly his entire imprisonment as a leading Communist collaborator, whose widespread propaganda broadcasts rendered him the "Tokyo Rose" of that era; later he concocted false claims of torture in order to protect himself against plausible accusations of treason. Although the evidence I found of McCain's broadcasts seemed persuasive, it was from secondary sources and inexact. But now the actual McCain tapes have been located and may soon be released. I've listened to one of them myself and it exactly matches the descriptions contained in my article, while an actual audio file naturally carries much greater evidentiary weight. And the very tight connection between McCain's deep wartime secrets and those surrounding the abandoned POWs ensure that if the first gains the awareness of the general public, the second will almost inevitably follow. McCain's sordid wartime record would represent the triggering fuse that might ignite a massive national political explosion.

Will the Arizona voters learn the true facts about John McCain? Perhaps, perhaps not. Trump is very much a loose cannon, whose 10 million agitated Twitter followers constitute an enormous alternative media distribution channel, and one which served him very well during the primaries. Just a few days ago, Trump held a remarkably hostile meeting with all the Republican senators, at which he threatened to personally ensure the defeat this year of Arizona Senator Jeff Flake. Apparently, he confused Flake, who is not up for reelection in 2016, with McCain, who is, and the latter has also been a major target of his political wrath.

Syd despised Donald Trump and everything he stood for, so it would be ironic indeed if Trump became the inadvertent vehicle of "the great cleansing of the Augean Stables" that Syd had sought for so many years.

I doubt if one Americans in twenty is aware that over forty years ago,

his government deliberately abandoned hundreds of POWs in Vietnam, and then spent four decades desperately covering up that enormous crime, with the media being a willing co-conspirator. But even if our citizens remain ignorant of that particular dark deed, over the years they have strongly come to suspect their elites are guilty of a vast number of equally heinous offenses, some of which are plausible and others ridiculous; and who can reasonably blame them? If our entire media would willfully ignore ?the story of the century? as massively documented by one of its most distinguished members, who can say what other matters might remain hidden from public view?

For years I've been telling my friends that unless and until our major media publications are finally willing to report Sydney Schanberg's stunning POW expose, I simply won't trust a word they write about anything else. And perhaps that is the most important legacy of one of America's greatest journalists.

# Relying Upon Maoist Professors of Cultural Studies

***The Unz Review*** • July 18, 2016 • 1,900 Words

Last week America suffered the loss of Sydney Schanberg, widely regarded as one of the greatest journalists of his generation. Yet as I'd previously noted, when I read his long and glowing obituary in the *New York Times*, I was shocked to see that it included not a single word concerning the biggest story of his career, which had been the primary focus of the last quarter century of his research and writing.

The cynical abandonment of hundreds of American POWs at the end of the Vietnam War must surely rank as one of the most monumental scandals of modern times, and the determined effort of the mainstream media to maintain this enormous governmental cover-up for over four decades raises serious doubts about whether we can believe what our newspapers report about anything else.

A couple of mainstream academics, one liberal and one conservative, whose names would be recognized as those of prominent public intellectuals, dropped me notes strongly applauding my effort to reopen the POW controversy and help get the truth out at last.

But the vast majority of my readers, perhaps being of a younger generation, were quite surprised to read my presentation, presumably having always vaguely assumed that talk of the "abandoned POWs" was just some Hollywood-inspired myth of the 1980s, generated by the success of the *Rambo* movies of the Reagan Era and continued by the populist paranoia of Ross Perot, before gradually fading away with the passage of time. I can't really blame them because until just a few years ago that was exactly my own impression.

As someone who was just a child during the Vietnam War and had no familial connection to the conflict, I'd paid little attention to the history. During the late 1970s and afterward, the newspapers had gradually informed me of the POW activists, with their wild talk of Americans still held for years after the war in secret prisons of Communist Vietnam and the dark accusations they made of government conspiracies working to suppress that truth.

Naturally, I'd discounted such claims as the most obvious lunacy, on a par with UFO abductions, and never doubted that the advocates were

exactly the sort of rightwing crackpots the media had always suggested. Every now and then lengthy cover stories had appeared in *The New Republic or The Atlantic Monthly,* among my favorite publications, strongly reinforcing that established verdict, and I always read those, nodded my head, and thought no more of the topic. For thirty-five years I never once considered the possibility that the POWs might have actually existed.

But perhaps it is exactly that past ignorance and disinterest in the Vietnam War and the ensuing POW controversy that affords me some reasonable objectivity on the issue, allowing me to analyze the facts much as I would a historical puzzle from Ancient Greece. And once I finally encountered both sides of the story in late 2008, the evidence in favor of the reality of the POWs seemed absolutely overwhelming.

When I discovered Schanberg's stunning 8,000 word expose online, an article rejected by nearly every significant publication in America, my first step was to locate copies of the conflicting articles that had once seemed so persuasive to me, and reread them much more carefully. Once I did that I realized that the factual argumentation they had provided had been extremely thin. Their contents heavily focused on the cultural and ideological aspects of the POW movement, with the possible reality of any POWs casually dismissed upon rather scanty evidence. What I had been reading was cultural criticism rather than investigative journalism.

To a considerable extent, the rightwing POW activists played into the hands of their critics by presenting the facts of the case upside down, framing their arguments in a way sure to attract the scorn of most reporters. Activist rhetoric was heavy with denunciations of the "treacherous" Communists in Hanoi, who cruelly kept our American POWs still imprisoned despite the peace agreement that ended the war. To any objective journalist, this surely sounded paranoid and ridiculous. Why would the Communists want to keep the American POWs? Out of pure evilness or something?

But the reality was exactly the opposite. It was the *American* government that had been treacherous, by refusing to pay the Vietnamese the $3.25 billion in reparations that they had demanded at the Paris Peace Talks as a price for ending the war and returning the POWs. If you buy a car and you refuse to pay, is it "treacherous" if the car dealer never delivers your vehicle?

The problem had been that for domestic political reasons the Nixon Administration chose to pretend that the promised payment of the money was unconnected with the prisoner return, instead labelling it "humanitarian assistance." Unsurprisingly, Congress balked at providing billions in foreign aid to a hated Communist adversary, and Nixon, weakened by the growing Watergate Scandal, couldn't admit that unless the money were delivered, Hanoi would refuse to return the remaining POWs.

This very simple and plausible reconstruction seems to have been completely ignored by the prestigious magazines that covered the controversy. For example, the July 1985 *TNR* cover story by James Rosenthal, a television journalist, ran nearly 3,000 words, but never raised this possibility, instead being overwhelmingly devoted to ridiculing the POW activists and their celebrity enablers, while questioning their motives. The supposed non-existence of the POWs was established by quoting a few government reports and official declarations. Rosenthal particularly emphasized that the head of the Defense Intelligence Agency (DIA) discounted any evidence of surviving POWs, apparently being unaware that, as Schanberg notes, his immediate DIA predecessor had long held exactly the opposite position, believing that the data indicated the existence of live POWs; after a bitter bureaucratic struggles, he had been forced into retirement over that very issue. Missing that sort of important detail represents the difference between publishing a solidly researched article and just a bit of casual beltway opinion journalism.

Even more drastic was my reappraisal of the December 1991 *Atlantic Monthly* cover story by H. Bruce Franklin. Entitled "The POW/MIA Myth" and running a remarkable 15,000 words, this lengthy debunking had appeared in one of America's most prestigious outlets for longform journalism at the very start of the Senate POW Hearings and must have heavily influenced the perceptions and tone of the daily print journalists who covered the hearings, while reporting the public statements of the various witnesses and the positions taken by Senators John McCain, John Kerry, and the other Committee members.

The very first sentence of Franklin's article noted that 69% of the American public then believed that live POWs were still being held in Southeast Asia, but he not unreasonably attributed much of this belief to the various popular Hollywood movies of the 1980s. Franklin is a cultural historian rather than an investigative journalist and he seems

to draw on few sources of information beyond the regular newspapers, yet casually ridicules a *60 Minutes* producer whose five year investigation had concluded that the POWs definitely existed. Given his own expertise and background, it is hardly surprising that Franklin devotes as much as 90% of the piece to the "cultural" aspects of the POW phenomenon—the rightwing activists who believed it, the hucksters who profited from it, the unrealistic plots of the Hollywood action movies that glorified it.

In a particularly ironic turn, he mocked anyone who might believe in an "enormous conspiracy" by the various arms of the U.S government to suppress the truth about the POWs. Ironic, because Franklin himself was an unrepentant radical Maoist who been one of the very few tenured professors fired during the campus turmoil of the 1960s when he incited riots at Stanford and organized attacks on university buildings. Apparently, he firmly believed that government officials all lied about Vietnam during the war itself, but became scrupulously honest once it had ended.

Franklin's naivete is almost charming. In 1985 President Reagan's National Security Advisor was secretly caught on tape admitting that POWs were probably still alive, a statement exactly contrary to his official public position. But Franklin attributes this stunning gaffe to the distorting psychological influence of the *Rambo* movies then playing in the theaters.

He also persuasively argues that Reagan himself firmly believed in the reality of the POWs and during his term of office made various secret attempts to rescue them, but uses these facts merely to portray the Gipper as ignorant and delusional, never apparently considering the possibility that the president of the United States might have access to better intelligence sources than those of a Maoist professor of cultural studies.

Meanwhile, Schanberg noted sworn testimony by Reagan's National Security Advisor, revealing that early in the administration an offer had been received via a third country suggesting Hanoi would return the surviving POWs in exchange for a payment of $4 billion (the difference from the original $3.25 billion presumably representing nearly a decade of accrued interest). Perhaps this development, rather than Hollywood action movies, helped explain the president's beliefs.

Indeed, perhaps the most remarkable aspect of Franklin's piece is that although he devotes 21 pages of magazine text to exhaustively exploring almost every cultural aspect of the so-called "POW Myth,"

including detailed plot summaries of several Hollywood action movies, he never once even mentions the $3.25 billion in reparations that America had promised Vietnam and then never paid, which likely constitutes the key to the entire political mystery. I find that omission highly suspicious and wonder whether he (or his editor) feared that providing such a telling clue might lead his readers to reconsider the entire logical framework being presented to them.

As mentioned, Franklin was an especially fervent opponent of the Vietnam War and he surely must have retained a burning political hatred for Henry Kissinger and the other Nixon Administration alumni whom he blamed for the disaster. But these individuals were obviously also the central figures behind the POW cover-up, and by applying a thick whitewash of cultural critique to the massive scandal, he helped ensure that none of them were ever called to account for their misdeeds by the American people. The term "useful idiot" surely comes to mind.

Over the years it has become quite apparent that major media outlets are sometimes enlisted as weapons in a subterranean propaganda war, and one must wonder whether publication of the massive Franklin cover story, timed to precisely coincide with the launch of the Senate POW Hearings, might have been an instance of this. Certainly there were powerful political figures very eager to bury the scandal once and for all, and what better way to do so than by providing a prestigious national platform for a cultural critic whose greatest personal specialty was the literary interpretation of science fiction, having him produce an article focusing so heavily upon the cultural and ideological shortcomings of the POW advocates while rather casually dismissing the possible factual basis of their case. Surely there must have been numerous investigative journalists available who might have used the same venue to provide the magazine's elite national readership with a much more realistic and balanced assessment of the facts. But perhaps that's exactly the point.

# Will There Be a *Spotlight* Sequel to *The Killing Fields*?

***The Unz Review*** • July 25, 2016 • 2,700 Words

The Best Picture winner at this year's Academy Awards was *Spotlight*, which seemed an excellent choice to me. That powerful ensemble performance showed a handful of daring investigative reporters at *The Boston Globe* taking on the political and cultural establishment of their city, breaking the story of how the Catholic Church had long shielded its numerous pedophile priests. The focus was less on the scandal itself and more on the obstacles faced by the journalists, including the widespread disbelief that a cover-up so vast could have remained in place for so long.

A couple of decades earlier, a college friend of mine then living in DC would occasionally regale me with stories of the bizarre lunatics he encountered in his neighborhood. There was one gentleman who regularly occupied a particular street corner with a home-made sign, declaring that he had been sexually molested by a Catholic priest and denouncing his church for protecting such individuals by concealing their abuses. Sometimes all that separates the discounted ravings of street madmen and a long series of international headlines is merely the willingness of a few bold journalists to ask some probing questions.

These thoughts came to mind as I read the various public tributes to Sydney Schanberg, whose distinguished journalistic history came to its end a few weeks ago. Naturally, the majority of the coverage focused on the years he had risked his life during the war in Cambodia, since those had led to his Pulitzer Prize, and later gained him permanent fame in the Oscar-winning film *The Killing Fields*. But his career spanned more than half a century, of which only a few years were spent overseas as a foreign correspondent, and in many respects those other, later years provide a story every bit as interesting, and perhaps even more relevant today, given the ills that currently plague our society. The plot lacks an uplifting happy ending, but that just makes the tale a more realistic one.

Soon after his return from Cambodia and his Pulitzer Prize, he was named Metropolitan Editor at the *New York Times*, with one-third of all the newspaper's journalists serving under him. But just a few years

later, he was gone, and his lengthy *Times* obituary devoted only a couple of sentences to his post-Cambodia years at the newspaper, though his longtime friend Charles Kaiser provided far more of the details in a recent *Vanity Fair* piece.

In one of our conversations, Syd casually mentioned that although major newspapers are very eager to uncover corrupt practices in distant lands such as Afghanistan or Bosnia, they are less happy when their employees undertake similar efforts closer to home, especially in their own city. And although I never pressed him to clarify what he meant, I sensed he was speaking from personal experience.

According to my late friend Alex Cockburn, the long-time *Press Clips* media critic at *The Village Voice*, Schanberg's focus on the more sordid aspects of his newspaper's editorial support for the West Side highway project eventually outraged top management, leading to his removal. He had spent 26 years at the *Times* and the 1984 triumph of *The Killing Fields* had established him as one of the world's most famous journalists, perhaps only trailing Woodward and Bernstein of Watergate fame; but in August 1985 he was supposedly escorted from his desk out the front door in the course of a single day.***[See below]***

Even while still at the *Times*, he had grown concerned at the decline of journalistic rectitude in the face of financial temptations, such as the growing possibilities for vast wealth opening to those newsmen who seized a lucky opportunity while never rocking the political boat. For example, he once told me the story of a newly hired network news anchor, just arrived in New York City, who joined a group of prominent local journalists for lunch. The newscaster's entire conversational focus was on the remarkably luxurious interiors of some of the Upper East Side co-op apartments he'd recently seen on a visit, and the chance he himself might have to live in such splendor. The anecdote was prompted by the case of a different network anchor, *ABC*'s Peter Jennings, who'd spent his entire career in the news business but managed to leave an estate worth $50 million to his heirs, an outcome that an old-fashioned reporter might view as unseemly.

Certainly, the remaining thirty years of Schanberg's own career demonstrated a very different lodestar. For years he had received reports from his military contacts of American POWs still held after the end of the Vietnam War, but his beat was the domestic politics of New York City and State, so he turned those tips over to his *Times* colleagues, who made little effort to energetically investigate them. However, once the Senate POW Committee hearings began in 1991,

he immersed himself in the issue, eventually publishing dozens of columns and articles on the topic over the next couple of years.

The great irony was that although the hearings actually caused the release of a vast quantity of new evidence, much of it strongly supporting the case for the abandoned POWs, the American political establishment instead seized the opportunity to end the nagging controversy by declaring the POWs a myth and the issue closed once and for all, with nearly our entire mainstream media following their lead. Thus, Schanberg began pursuing the massive scandal at exactly the point at which the American media had suddenly lost almost all interest, and he spent the remainder of his life doggedly pursuing a topic that caused him to receive what he later called the "Silent Treatment."

Schanberg's story might surely make a very powerful film or documentary, demonstrating the darker realities of contemporary American journalism, but only if the huge hidden scandal that he had spent a quarter century seeking to reveal were actually true. The evidence of the abandoned POWs seems overwhelming to me, but I am hardly an expert on Vietnam, and must simply weigh the facts and opinions presented by others.

For example, a few years ago Schanberg's journalistic integrity and excellence were hailed by Joseph Galloway, an award-winning military affairs writer specializing in the history of the Vietnam War, who included this appraisal:

> More recently, Schanberg's was among the few voices calling to account two U.S. senators, John McCain and John Kerry, both Vietnam veterans, for manipulating the findings of a special Senate committee to cover up the truth: that the Nixon White House, directed by President Nixon and his war planner, Henry Kissinger, left hundreds of living American POWs behind in the hands of their captors when we evacuated Vietnam.

On the other hand, I also recently discovered a totally contrary view advanced by Rick Perlstein, a highly-regarded author of books on the conservative political culture of the Goldwater and Nixon Eras, who denounced belief in the abandoned POWs as a ideological myth born of rightwing paranoia, tainted with sharp racialist sentiment. He favorably cited the views of H. Bruce Franklin, a Maoist cultural historian, whose 1991 analysis I have already rejected as factually

shallow, but he more heavily quoted from the conclusions of mainstream historian Michael J. Allen, whose work *Until the Last Man Comes Home* he described as "the definitive book on the subject."

Through the modern miracle of Amazon.com, Allen's book was soon in my hands, and I spent a day or two carefully reading it, hoping to decide how effectively the author refuted the factual claims of Schanberg and others.

In most respects, *Until the Last Man Comes Home* seems a fine work of academic scholarship, well-written, published by a university press, and featuring glowing blurbs from other historians. The main text runs 300 pages with over 100 additional pages of footnotes and bibliography, along with a lengthy index. But when I turned to that index, the name "Sydney Schanberg" was nowhere to be found.

The absence of any reference to the most prestigious figure in the pro-POW camp troubled me, but I explained it away. After all, Schanberg's remarkable 8,000 word expose on the POW cover-up had been rejected by every mainstream publication and had only been released on a website in late 2008, perhaps after the Allen's 2009 book had already gone to press, while nearly all his numerous earlier pieces from the early 1990s had either run as newspaper columns or otherwise appeared outside of mainstream outlets. Allen may have just disregarded these as superseded by later analysis.

However, the next lapse I discovered seemed completely inexcusable. The most comprehensive recent presentation of the pro-POW case is surely *An Enormous Crime* by former U.S. Rep. Bill Hendon, who also worked as a Pentagon intelligence analyst specializing in POW issues and as an investigator for the Senate POW Committee. Given Hendon's background, he seems well suited to provide an inside perspective on the topic, and his 600 page volume exhaustively documents the factual details and entire history surrounding the alleged abandonment of the POWs, providing a cornucopia of evidence, much of it seemingly persuasive. The hardcover edition was released in Spring 2007 by an imprint of Macmillan, a mainstream publishing house, but although Allen's very extensive bibliography lists some 250 books, Hendon's is not one of them. Refuting Hendon's arguments is one thing, but simply ignoring them is quite another.

As I started to read the actual Allen text, I better understood why including those missing works might have constituted a problematical distraction from the central flow of Allen's narrative. Although Allen thoroughly explores the political, ideological, social, cultural,

psychological, and historical aspects of the Vietnam POW movement, he devotes relatively little attention to the factual question itself: did the abandoned POWs actually exist? Page after page is given over to the complex internal politics and interpersonal disputes of the various POW activist groups, but it would also be nice to be able to decide whether their basic beliefs had indeed had merit.

Consider, for example, the claim that soon after Reagan took office in early 1981, Canada passed along a diplomatic overture by Hanoi offering to return the remaining American POWs they held in exchange for a payment of $4 billion, representing the cash they had been secretly promised in the original peace agreement but never received. Schanberg devotes several long paragraphs to this vital piece of evidence, and Hendon's book gives it four full pages. Together, these sources provide the names of several former government officials attesting to the reality of this crucial incident, including with sworn testimony, but it receives no mention whatsoever in Allen's book. On the other hand, Allen does devote nearly a dozen pages to the American Civil War and the stories of the missing soldiers and POWs in that 19th century conflict.

Going down the list of the major evidentiary findings provided by Schanberg, few of them are mentioned, let alone effectively refuted by Allen, who seems equally ignorant of the 600 pages of material provided by Hendon. If one side in an ongoing historical debate provides a vast quantity of seemingly persuasive evidence, while the other side simply avoids the argument, what conclusions should be drawn by a fair-minded outside observer? Attempting to debunk a controversial hypothesis by ignoring all the most powerful "smoking guns" then casually dismissing the remaining evidence as merely circumstantial is unlikely to persuade any neutral third-party who is provided the two opposing arguments. Perhaps this explains why the mainstream media has been so reluctant to offer space to both sides of the POW argument, and has instead declared the entire matter "Case Closed."

Allen's apparent unwillingness to pursue leads found in non-mainstream publications may have caused him to miss important and persuasive evidence. For example, he correctly emphasizes that Sen. John McCain played an absolutely pivotal role at the Senate POW Committee Hearings: he was only former POW among the members and also the most ferocious opponent of the POW activists. Indeed, Allen argues that McCain alone possessed the "moral authority" to defeat the POW advocates in the important arena of public opinion. Then, near the very end of his book, Allen separately mentions "the

furious smear campaign" McCain later endured at the hands of some of those activists and veterans groups, who accused him of wartime treason and all sorts of other moral failings, but dismisses these charges as the unsubstantiated attacks of extremists, who typified their ideological movement.

This might seem a plausible analysis, but additional facts change the picture. In an article last year, I pointed out that there seems to be overwhelming evidence that McCain did indeed spend his time as a POW doing enemy propaganda broadcasts for Hanoi, which would surely mark him as a "traitor," and that he very likely later invented his tales of torture as a preemptive defense against the risk of a court martial upon his return. McCain's wartime behavior was apparently quite well known in POW circles, and a short wire story in a 1969 edition of *Stars and Stripes* magazine described his radio broadcasts on behalf of his Communist captors. Indeed, I now possess a recently located audio file of one of McCain's wartime Hanoi broadcasts, which seems absolutely genuine to me.

The former top-ranking officials of the Nixon Administration and their Pentagon allies were obviously the persons most eager to expunge the widespread popular belief that they had abandoned American POWs, and these same individuals surely not only knew of McCain's true wartime record, but also possessed the hard evidence to prove it and destroy him politically. These hidden facts may easily explain why McCain acted as such a ferocious bulldog at the hearings, regularly denouncing both his opposing senatorial colleagues and even the relatives of unreturned POWs in extremely harsh and personal terms. Under such a reconstruction, the senator's "moral authority" may have been considerably less than what Allen assumes.

There are times when a concerted alliance of powerful American elites are determined to establish a particular narrative history of events, facts be damned, and under such circumstances the mainstream media often serves as their handmaiden. A massive and perfectly-timed cover story in *The Atlantic Monthly*, sharply slanted coverage in major newspapers, and selective statements by influential public officials may have succeeded in achieving this during the Senate POW Committee hearings. And once such an official narrative has been established, later editors may easily be persuaded that any attempts to reopen the issue are either just "old news" or instead are based on wild "conspiracy theories," long since debunked. Under such circumstances, even an individual of Sydney Schanberg's stellar journalistic reputation may find it impossible to break through these thick walls of silence.

Meanwhile, Michael J. Allen may be a perfectly fine young scholar, but he was apparently still untenured at the time this book, his first, appeared in print, and I suspect his academic career path would have become considerably more difficult if he had suggested factual conclusions totally divergent from those of nearly the entire American political and media establishment.

These sorts of practical realities must be considered whenever we analyze controversial topics upon which our elite establishment has already proclaimed its definitive and final verdict.  Principled journalists and historians may seek to speak truth to power, but the converse may be a more typical outcome.

***[Correction: I have been reliably informed that elements of Alex Cockburn's account of the circumstances surrounding Sydney Schanberg's departure from The New York Times were seriously mistaken. Although his Times column was cancelled, he was actually offered another position at the paper by the publisher, but preferred to leave instead and soon began writing a column for NY Newsday, where he remained for the next ten years.]***

# Mass Deaths and Morning Newspapers

August 1, 2016 • 1,700 Words

To recast a famous philosophical conundrum, what would happen if hundreds of thousands of Americans died, but the media never reported that calamity?

I spend hours each morning closely reading the print editions of my daily newspapers, and for over a decade that question has seemed real rather than merely hypothetical. The reason may be summarized in one word: ﷺ

Vioxx? What's Vioxx? I suspect that the overwhelming majority of Americans today would have only the vaguest recollection of that name, and if forced to guess, the largest number might respond: ﷺ

Actually, no. The Vioxx Scandal of the mid-2000s represented one of the greatest medical health disasters of modern times, almost entirely due to corporate greed. An ocean of Americans perished, tens of thousands by official government estimate, but with the true figure more likely ranging into the hundreds of thousands. Yet despite that huge body-count, no one was ever punished, and the entire affair was quickly shoved down the memory hole by our national media, perhaps because the media itself had been a major financial participant.

The story is a simple one. At the end of the 1990s, pharmaceutical giant Merck introduced a patented, vastly more expensive substitute for simple aspirin, which it marketed as a painkiller to the elderly by spending hundreds of millions of dollars on direct-to-consumer advertising through television and other media outlets. The advertising did the trick, and twenty-five million Americans were eventually prescribed Vioxx, generating over $2 billion in annual revenue.

The media benefited from the advertising, Merck benefited from the sales, and many millions of Americans benefited from an effective arthritis remedy that supposedly had fewer side-effects than old-fashioned aspirin. Unfortunately, one of these side-effects turned out to be a huge increase in the risk of strokes and heart attacks, many of them fatal.

Some of initial media reports indicated that Merck had desperately fought behind the scenes to suppress the FDA study demonstrating that their extremely lucrative drug had already killed at least 35,000 Americans, but then voluntarily recalled that drug just days before the research report was finally scheduled for release.

And there was a striking epilogue to this scandal, ignored by the media, but which I discussed in an article published a few years ago. Since the historical facts haven't changed, I quote a few of my crucial paragraphs:

> This story of serious corporate malfeasance largely forgiven and forgotten by government and media is depressing enough, but it leaves out a crucial factual detail that seems to have almost totally escaped public notice. The year after Vioxx had been pulled from the market, the *New York Times* and other major media outlets published a minor news item, generally buried near the bottom of their back pages, which noted that American death rates had suddenly undergone a striking and completely unexpected decline.
>
> The headline of the short article that ran in the April 19, 2005 edition of *USA Today* was typical: USA Records Largest Drop in Annual Deaths in at Least 60 Years. During that one year, American deaths had fallen by 50,000 despite the growth in both the size and the age of the nation's population. Government health experts were quoted as being greatly surprised and scratching [their] heads over this strange anomaly, which was led by a sharp drop in fatal heart attacks.
>
> On April 24, 2005, the *New York Times* ran another of its long stories about the continuing Vioxx controversy, disclosing that Merck officials had knowingly concealed evidence that their drug greatly increased the risk of heart-related fatalities. But the *Times* journalist made no mention of the seemingly inexplicable drop in national mortality rates that had occurred once the drug was taken off the market, although the news had been reported in his own paper just a few days earlier.
>
> A cursory examination of the most recent 15 years worth of national mortality data provided on the Centers for Disease Control and Prevention website offers some intriguing clues to this mystery. We find the largest rise in American mortality rates occurred in 1999, the year Vioxx was introduced, while the largest drop occurred in 2004, the year it was withdrawn. Vioxx

> was almost entirely marketed to the elderly, and these substantial changes in national death-rate were completely concentrated within the 65-plus population. The FDA studies had proven that use of Vioxx led to deaths from cardiovascular diseases such as heart attacks and strokes, and these were exactly the factors driving the changes in national mortality rates.
>
> The impact of these shifts was not small. After a decade of remaining roughly constant, the overall American death rate began a substantial decline in 2004, soon falling by approximately 5 percent, despite the continued aging of the population. This drop corresponds to roughly 100,000 fewer deaths per year. The age-adjusted decline in death rates was considerably greater.

Back in college I had a strong interest in the old Soviet Union, and was always amused when experts explained that some of the most important news developments were often tucked away as small items in the back pages of *Pravda* or *Izvestia*. I find it distressful that the same situation now seems true in our own society.

I was prompted to resurrect this old story after I attended a rare dinner party a few days ago with a group of Republican political activists. One of the individuals was quite agitated at the supposedly dangerous nature of our Chinese imports, and launched into a lengthy diatribe against that totally corrupt foreign government. He angrily reminded his listeners about the Melamine Scandal, in which baby food products sold in China were adulterated by a potentially harmful plastic chemical compound, leading to the illness of hundreds of thousands of infants and the death of six. Although I was too polite to interrupt his monologue, I knew those details quite well since I had directly contrasted that case—and the reaction of the Chinese government—with how America had handled the Vioxx disaster:

> China's leaders may not be democratically elected, but they pay close attention to strong popular sentiment. Once pressed, they quickly launched a national police investigation which led to a series of arrests and uncovered evidence that this widespread system of food adulteration had been protected by bribe-taking government officials. Long prison sentences were freely handed out and a couple of the guiltiest culprits were eventually tried and executed for their role, measures that gradually assuaged popular anger. Indeed, the former head of the Chinese FDA had been

executed for corruption in late 2007 under similar circumstances.

Obviously, the two situations were not exactly parallel, but consider the different reactions by the national government and media, and what it implies about the realities of popular control in the two societies. In China, a wave of illness culminating in the deaths of six infants became a gigantic national scandal, leading to prison sentences and even executions for the corrupt businessmen responsible and the government officials who facilitated their crimes.

Meanwhile, in the United States a somewhat similar medical scandal producing a body-count *perhaps fifty thousand times larger* was quickly hushed up and forgotten by the media, with no serious government investigation or significant punishment for any of the guilty parties. The Merck CEO was forced to resign and replaced by one of his top lieutenants, but allowed to keep his $50 million in past bonuses, greatly boosted by lucrative Vioxx sales. A lengthy class-action lawsuit was eventually settled, with the trial lawyers splitting almost $2 billion among themselves, while payouts to the actual victims amounted to roughly $100 per Vioxx user or perhaps $10,000 per American fatality. Given these facts, is it China or is it America that seemingly possesses a free and vigorous media, with a government responsive to the will of the people and protective of their best interests?

Nearly a half century ago, China was in the throes of Mao's Great Proletarian Cultural Revolution, and its government behaved very oddly, leading to all sorts of long-term problems for Chinese society. These days, China seems like a perfectly normal country with a perfectly normal government, and instead it is our own political leadership whose bad behavior may inspire much hand-wringing among future historians.

When ruling elites have little concern for the best interests of the populations they govern, the results can be dire. Under the drunken and totally corrupt Yeltsin Regime of the 1990s, Russia's national wealth was looted by its financial Oligarchs, who siphoned off vast quantities to their overseas holdings while reducing much of the Russian population to penury. As a direct consequence, Russia suffered one of the greatest peacetime demographic collapses in modern world history, a collapse that was quickly ended and gradually reversed once a patriotic nationalist such as Vladimir Putin came to power and implemented different policies.

Late last year a pair of prominent scholars revealed a stunning rise in

the death rates of white Americans over the last dozen years, and some have noted the intriguing parallel between Russia of the Yeltsin years and the situation in our own country. The rapid growth in the highly lucrative prescription drug industry seems a major contributor to this dire health situation, which is heavily concentrated among the non-affluent, whose real wages have stagnated or declined for most of the last 40 years. When large population groups gradually notice that their mortality rates are rising and their financial well-being is falling, they may grow dissatisfied with their existing national elites, and the widespread popularity of Donald Trump in such circles should hardly come as a great surprise.

In his most recent book, Prof. Michael Hudson, a distinguished international economist, has correctly emphasized the strong structural similarities between biological and economic systems. Based on this useful correspondence, he suggests that many of America's current problems may be best understood once we recognize that our society has been very heavily parasitized by its extractive elites. He further notes that parasites typically attempt to seize control of the sensory organs and central nervous system of their unfortunate host, thereby disorienting their victim or even convincing it that they represent an integral and necessary part of the organism's own tissue.

Since the mainstream media constitute the sensory organs of our body politic, Hudson's words often ring true as I read my morning newspapers.

# Did the US Plan a Nuclear First Strike Against Russia in the Early 1960s?

August 15, 2016 • 2,500 Words

Several years ago, my articles advocating a large hike in the minimum wage caught the attention of James Galbraith, the prominent liberal economist, and we became a little friendly. As president of Economists for Peace and Security, he invited me to speak on those issues at his DC conference in late 2013. And after the presentations, he arranged a meeting with a friend of his, influential in DC political circles, at which the two of us could present my minimum wage proposals.

While we were waiting for the taxi to take us to that meeting, I heard him quietly discussing a few other matters with a friend standing next to him. Phrases such as "attacking Russia," "a nuclear first strike," and "Kennedy and the Joint Chiefs" came to my ears. I can't recall the exact words, but the conversation stuck in my mind both at the time and on my later flight home that evening, and although I hadn't mentioned anything, I wondered what remarkable historical facts he had been discussing. His father, the legendary economist John Kenneth Galbraith, had spent decades as one of America's most prominent public intellectuals and was a very influential figure in the Kennedy Administration, so I assumed that he was not merely engaging in casual speculation.

Finally, a week or two later, my curiosity got the better of me, and I dropped him a note, gingerly raising the topic I'd accidentally overheard. I suggested that if he possessed any private information regarding so astonishing a possibility—that the Kennedy Administration might have considered a nuclear first strike against the USSR—perhaps he had a duty to bring the facts to public awareness lest they be lost to history.

He replied that he'd indeed found persuasive evidence that the US military had carefully planned a nuclear first strike against the Soviet Union in the early 1960s, and agreed about the historical importance. But he'd already published an article laying out the case. Twenty years earlier. In *The American Prospect*, a very respectable though liberal-leaning magazine. So I located a copy on the Internet:

- Did the U.S. Military Plan a Nuclear First Strike for 1963? Heather A. Purcell and James K. Galbraith, *The American Prospect*, Fall 1994

I quickly read the article and was stunned. The central document was a Top Secret/Eyes Only summary memo of a July 1961 National Security Council meeting written by Howard Burris, the military aide to then-Vice President Lyndon Johnson, which was afterward deposited in the Johnson Archives and eventually declassified. The discussion focused on the effectiveness of a planned nuclear first strike, suggesting that 1963 would be the optimal date since America's relative advantage in intercontinental nuclear missiles would be greatest at that point. Galbraith's student, Heather A. Purcell, had discovered the memo and co-authored the article with him, and as they pointed out, this meeting was held soon after the US military had discovered that the Soviet missile forces were far weaker than previously had been realized, leading to the plans for the proposed attack and also proving that the first strike under discussion could only have been an American one.

This history was quite different from the deterrent-based framework of American nuclear-war strategy that I had always absorbed from reading my textbooks and newspapers.

Obviously no nuclear attack took place, so the plans must have been changed at some point or discarded, and there were various indications that President Kennedy had had important doubts from the very beginning. But the argument made was that at the time, the first strike proposal was taken very seriously by America's top political and military leadership. Once we accept that idea, other historical puzzles more easily fall into place.

Consider, for example, the massive campaign of "civil defense" that America launched immediately thereafter, leading to the construction of large numbers of fallout shelters throughout the country, including the backyard suburban ones which generated some famously ironic images. Although I'm hardly an expert on nuclear war, the motivation had never made much sense to me, since in most cases the supplies would only have been sufficient to last a few weeks or so, while the deadly radioactive fallout from numerous Soviet thermonuclear strikes on our urban centers would have been long-lasting. But an American first strike changes this picture. A successful U.S. attack would have ensured that few if any bombs fell on American soil, with the shelters intended merely to provide a couple of weeks of useful protection until the global radioactive dust-clouds resulting from the nuclear

destruction of the Soviet Union had dissipated, and these anyway would have only reached America in highly attenuated form.

Furthermore, we must reassess the background to the 1962 Cuban Missile Crisis, certainly one of the most important and dangerous events of that era. If Soviet military analysts had reached conclusions similar to those of their American counterparts, it is hardly surprising that their political leaders would have taken the considerable risk of deploying nuclear warheads on intermediate range missiles close to American cities, thereby greatly multiplying their deterrent capability immediately prior to their point of greatest strategic vulnerability. And there was also the real possibility that their intelligence agents might have somehow gotten hints of the American plans for an actual nuclear first strike. The traditional view presented in the American media has always been that an unprovoked American attack was simply unimaginable, any Soviet paranoia notwithstanding, but if such an attack was not only imagined but actually planned, then our Cold War narrative must be significantly modified. Indeed, perhaps important aspects of the superpower confrontations of that era should be completely inverted.

Could such a momentous historical discovery have been so totally ignored by our mainstream journalists and historians that I'd never heard of it during the previous twenty years? Gossipy rumors of an additional JFK infidelity might periodically make the headlines, but why was there no discussion of serious plans to launch a non-defensive global thermonuclear war likely to kill many millions?

I have limited expertise in either analyzing nuclear warfare strategy or interpreting national security documents, so I could easily be making an error in evaluating the strength of the case. But in a later issue of *TAP*, William Burr and David Alan Rosenberg, scholars proficient in exactly those areas, published a lengthy rebuttal to the article, followed by a rejoinder from Galbraith and Purcell. And in my own opinion, the Burr/Rosenberg critique was quite unpersuasive.

- Correspondence: Nuclear Scare
  William Burr, David Alan Rosenberg, James K. Galbraith, Heather A. Purcell, *The American Prospect*, Spring 1995

In their arguments, they emphasized that the key document was found in the Vice Presidential archives, while the National Archives and those of President Kennedy himself are usually a far better source of important material. But perhaps that's exactly the point. The authenticity of the Burris document was never disputed, and Burr/

Rosenberg cite absolutely no contradictory archival material, implying that the documentary evidence was not available to them. So the materials dealing with such an extraordinarily explosive proposal had elsewhere either not been declassified or might even have been removed from the main archives, with only the less direct Burris summary memo in a secondary location surviving the purge and later being declassified, perhaps because its treatment of the subject was much less explicit.

Meanwhile, a careful reading of the Burris memo seems to strongly support the Galbraith/Purcell interpretation, namely that in July 1961 President Kennedy and his top national security officials discussed cold-blooded plans for a full nuclear attack against the Soviet Union in roughly two years' time, when the relative imbalance of strategic forces would be at its maximum. The proposal seemed quite concrete, rather than merely being one of the numerous hypotheticals endlessly produced by all military organizations.

In a later footnote, Galbraith even mentioned that he subsequently had his interpretation personally confirmed by Kennedy's former National Security Advisor: &#65533;When once I asked the late Walt Rostow if he knew anything about the National Security Council meeting of July 20, 1961 (at which these plans were presented), he responded with no hesitation: `Do you mean the one where they wanted to blow up the world?'&#65533;

Once I accepted the reasonable likelihood of the analysis, I was shocked at how little attention the remarkable article had received. When I simply Googled the names of the authors &#65533;Galbraith Heather Purcell&#65533; I mostly discovered very brief mentions scattered here and there, generally in specialized books or in articles written by Galbraith himself, and found absolutely nothing in the major media. Possibly one of the most important revisions to our entire history of the Cold War—with huge implications for the Cuban Missile Crisis—seems to have never achieved any significant public awareness.

And there is also a sequel on this same topic. In 2001 military affairs writer Fred Kaplan published a major article in *The Atlantic* with the explicit title &#65533;JFK's First-Strike Plan.&#65533; Drawing upon a wealth of newly declassified archival documents, he similarly described how the Kennedy Administration had prepared plans for a nuclear first strike against the Soviets. His analysis was somewhat different, suggesting that Kennedy himself had generally approved the proposal, but that

the attack was intended as an option to be used during a hypothetical future military confrontation rather than being aimed for a particular scheduled date.

- JFK's First-Strike Plan
  Fred Kaplan, *The Atlantic*, October 2001

The government plans unearthed by Kaplan are clearly referring to the same strategy discussed in the Burris memo, but since Kaplan provides none of the documents themselves, it is difficult to determine whether or not the evidence is consistent with the somewhat different Galbraith/Purcell interpretation. It is also decidedly odd that Kaplan's long article gives no indication that he was even aware of that previous theory or its differing conclusions, containing not a single sentence mentioning or dismissing it. I find it very difficult to believe that a specialist such as Kaplan remained totally unaware of the earlier *TAP* analysis, but perhaps this might possibly be explained given the near-total media blackout. Prior to the establishment of the Internet or even in its early days, important information ignored by the media might easily vanish almost without a trace.

Kaplan's long article seems to have suffered that similar fate. Aside from a few mentions in some of Kaplan's own later pieces, I found virtually no references anywhere in the last 15 years when I casually Googled it. Admittedly, the timing could not have been worse, with the article appearing in the October 2001 edition of the magazine, released in the immediate aftermath of the 9/11 attacks, but the silence is still troubling.

The unfortunate fact is that when a massively important story is reported only once, with virtually no follow-up, the impact may be minimal. Only a small slice of the public encounters that initial account, and the lack of any repetition would eventually lead even those individuals to forget it, or perhaps even vaguely assume that the subsequent silence implied that the claims had been mistaken or later debunked. Every standard historical narrative of the 1960s that continues to exclude mention of serious plans for an American nuclear first strike constitutes a tacit denial of that important reality, implicitly suggesting that the evidence does not exist or had been discredited. As a consequence, I doubt whether more than a sliver of those seemingly informed Americans who carefully read the NYT and WSJ each morning are aware of these important historical facts, and perhaps the same is even true of the journalists who write for those esteemed publications. Only repetition and continuing coverage gradually incorporates a story into our framework of the past.

It is easy to imagine how things might have gone differently. Suppose, for example, that similarly solid evidence of plans for a devastating and unprovoked nuclear attack on the Soviet Union had been found in the archival records of the presidential administrations of Richard Nixon or Ronald Reagan. Is there not a far greater likelihood that the story have been heavily covered and then endlessly repeated in our media outlets, until it had become full embedded in our standard histories and was known to every informed citizen?

In some respects, these discussions of events from over a half-century ago have little relevance for us today: the individuals involved are now all merely names in our history books and the world is a very different place. So although the sharp differences between the Galbraith/Purcell analysis and that of Kaplan might engage academic specialists, the practical differences would today be minimal.

But what has enormous significance is the media silence itself. If our media failed to report these shocking new facts about the early 1960s, how much can we rely upon it for coverage of present-day events of enormous importance, given the vastly more immediate pressures and political interests which are surely brought to bear? If our mainstream histories of what happened fifty years ago are highly unreliable, what does that suggest about the stories we read each morning concerning the ongoing conflicts in Ukraine or the South China Sea or the Middle East?

Consider a particularly troubling thought-experiment. Suppose that the proposed nuclear attack on Russia had actually gone ahead, resulting in millions or tens of millions dead from the bombs and worldwide radioactive fallout, perhaps even including a million or more American casualties if the first strike had failed to entirely eliminate all retaliatory capability. Under such a dire scenario, is it not likely that every American media organ would have been immediately enlisted to sanitize and justify the terrible events, with virtually no dissent allowed? Surely John F. Kennedy would have been enshrined as our most heroic wartime president—greater than Lincoln and FDR combined—the leader who boldly saved the West from an imminent Soviet attack, a catastrophic nuclear Pearl Harbor. How could our government ever admit the truth? Even decades later, this patriotic historical narrative, uniformly endorsed by newspapers, books, films, and television, would have become almost unassailable. Only the most marginal and anti-social individuals would dare to suggest that the facts might actually have been otherwise, and they

would be widely regarded as eccentric or even mentally ill for doing so. After all, how would the general public know anything different? As I always tell people, the media creates reality.

I am grateful that the world escaped this terrible nuclear disaster. But I find it disturbing that I spent decades religiously reading *The New York Times* every morning, but only discovered this crucial element of the Cold War by overhearing a conversation while waiting for a taxi.

**Postscript:**

Prof. James Galbraith has now provided a note, clarifying his own views on the issues discussed in this article:

http://www.unz.com/runz/american-pravda-did-the-us-plan-a-nuclear-first-strike-against-russia-in-the-early-1960s/?showcomments#comment-1531657

# Was General Patton Assassinated?

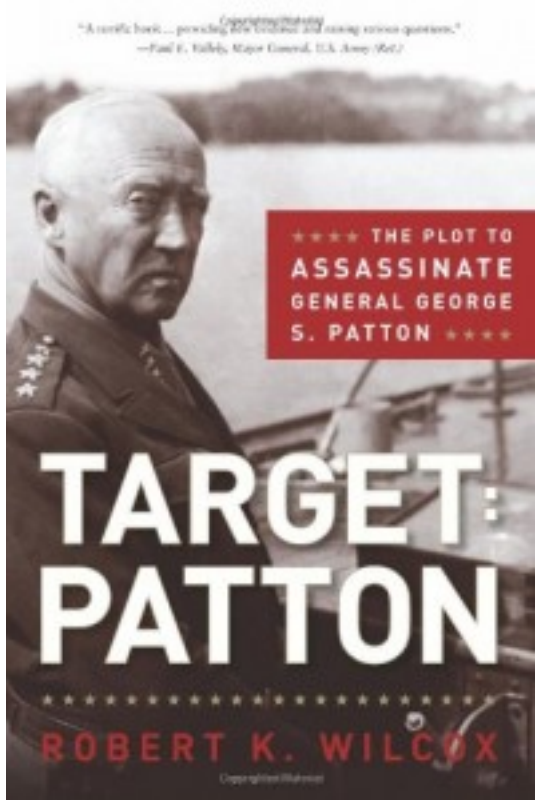
August 22, 2016 • 2,400 Words

During the long Cold War many Russians grew sufficiently disenchanted with the lies and omissions of their own news outlets that they turned to Western radio for a glimpse of the truth.

The growth of the Internet has now provided Americans with a similar opportunity to click on a foreign website and discover the important stories that have somehow escaped the attention of their own leading journalists. Ironically, much of such alternative media coverage actually appears in the leading British newspapers, eminently respectable and published in our closest historic ally.

For example, three or four years ago I noticed a link on a prominent libertarian website suggesting that George S. Patton, one of America's most renowned World War II military commanders, had been murdered by order of the U.S. government. Not being someone much drawn to conspiracy-mongering, the lurid claim seemed totally outlandish, but I decided to click my mouse and harmlessly examine a bit of Internet fringe-lunacy. However, the source turned out to be a lengthy article in Britain's *Sunday Telegraph*, one of the world's leading newspapers, describing a newly published book based on a decade of detailed research and interviews undertaken by an experienced American military affairs writer.

The book and the article had appeared in 2008 and I had never heard a word about the story in any of my major American newspapers. The description seemed sufficiently factual and detailed that I consulted a couple of prominent academics I know, with backgrounds in history and political science. They had also never encountered the theory, being just as surprised as I was by the material and by the fact that such remarkable revelations had never received any attention in our own country, home of the freest and most scandal-mongering media in the world.



With curiosity getting the better of me, I ordered the book for about $8 from Amazon.com.

Target Patton, written by Robert K. Wilcox and published by Regnery Press, runs over 450 pages, with an extensive bibliography and nearly 700 footnotes. The many years spent by the author on this project are clearly reflected in the contents, which include numerous personal interviews and the careful analysis of an enormous amount of primary and secondary source material. I've seldom encountered so detailed and seemingly exhaustive a work of investigatory journalism, quite understandable given the explosive nature of the charges being made. And yet the expose had never reached readers of the American mainstream media.

I personally found the evidence for Patton's assassination quite persuasive, even overwhelming, and any curious readers can currently order the book for as little as $2.93 plus shipping and judge for themselves.

Wilcox himself had been just as shocked as anyone else when he first encountered the surprising claims, but the initial evidence persuaded

him to invest years fully researching the theory before publishing the results. Some of his major findings seem quite telling.

In the months before his death, Patton had become a powerful critic of the American government, its conduct of World War II, and its policy toward the Soviets. He planned to resign from the military after returning to the U.S. and then begin a major public speaking tour against America's political leadership; as one of our most celebrated war heroes, his denunciations would certainly have had a huge impact. His fatal car accident took place the day before his scheduled departure home, and he had narrowly escaped death twice before under very strange circumstances.

There are extensive personal interviews with the self-confessed government assassin, then attached to America's OSS intelligence service, the wartime forerunner of the CIA. This operative had a long and substantially documented career in exactly that sort of activity, both during the war itself and for decades afterward, allegedly working internationally on a free-lance basis and "weeding" selected human targets both for the CIA and various other employers. Towards the end of his life, he became disgruntled over what he regarded as his ill-treatment by ungrateful U.S. government bureaucrats and also a bit guilt-ridden over having been responsible for the death of one of America's greatest military heroes, prompting his decision to go public, with his claims backed by a voluminous personal diary. Numerous other interviews with individuals connected with the circumstances of Patton's death seemed to largely corroborate the theory.

The assassin recounted that OSS Chief William Donovan had ordered the killing on the grounds that Patton had "gone crazy," becoming a major threat to American national interests. Around this same time, a military counter-intelligence field agent began encountering credible reports of a planned assassination plot against Patton and attempted to warn his superiors, including Donovan; not only were his warnings disregarded, but he was repeatedly threatened, and at one point, even placed under arrest. It seems clear that Donovan's orders came from his superiors, either in the White House or elsewhere.

The motivation may or may not have ultimately had a foreign origin. Over the last twenty years, scholars such as John Earl Haynes and Harvey Klehr have exhaustively demonstrated that during the 1930s and 1940s a large network of Communist spies had gained enormous influence in the uppermost reaches of the American government. Indeed, Wilcox carefully documents how the OSS itself had been

heavily infiltrated at the highest levels by elements of the Soviet NKVD, and that during this particular period, the two intelligence organizations were in an ambiguous quasi-partnership, with Donovan being especially eager to curry political favor with the pro-Soviet elements near the top of the U.S. government.

Meanwhile, Patton, a zealous anti-Communist, had very different views, urging an immediate military attack on the weakened forces of the Soviet Union. It is easy to understand how Stalin and those American leaders in his orbit might have decided that Patton's physical removal was an absolute priority.

At the time of his death, Patton was the highest ranking U.S. military officer in Europe, and the story naturally became front-page news throughout the world. Several official reports were produced regarding the exact circumstances of the very strange traffic accident responsible, but all of these have completely disappeared from U.S. government files. I find it difficult to imagine a non-sinister explanation for this.

These few paragraphs provide merely the smallest slice of the enormous amount of documentary material and painstaking analysis that Wilcox spent ten years compiling for his outstanding book. Obviously, many questions remain, and absolute proof is impossible seventy years after the event. But from my perspective, the likelihood of an assassination, almost certainly with the active involvement of top American officials, seems overwhelming.

I have also been reliably informed that for many years there has been a widespread belief within the American intelligence community that Patton was eliminated by the U.S. government for political reasons. Such quiet knowledge in those circles is hardly surprising. The alleged government assassin first publicly confessed his guilt in the plot decades ago in front of a journalist at an OSS reunion dinner in DC, while seated at the table of his longtime friend and colleague William Colby, former Director of the CIA. And although the resulting local news stories were completely ignored by the national media, it is hardly surprising that word soon got around within intelligence circles.

Perhaps some experienced scholar with a different perspective could invest time and effort attempting to refute the powerful case set forth by Wilcox, though none apparently has. But suppose that the evidence for this theory is not nearly as overwhelming as it appears, and only sufficient to provide a reasonable possibility that the story is

true, perhaps a 25% likelihood. I would argue that if there exists even a slight chance that one of America's most renowned generals—our top-ranking military officer in post-WWII Europe—was assassinated for political reasons by America's own government, the scandal would surely rank among the greatest in modern U.S. history.

The book was written by a reputable author and published by a mainstream though conservative-oriented press, but it went unmentioned in America's major national publications, whether conservative or liberal, nor was any subsequent investigation undertaken. A leading British newspaper reported what American journalists had totally ignored.

It seems likely that if a similar book had been published providing such solidly-documented historical revisionism regarding the sudden death of a top Russian or Chinese general at the close of the Second World War, the story might have easily reached the front pages of the *New York Times*, and certainly the weekly *Book Review* section. Perhaps there might even have been considerable media coverage if the victim had been a prominent Guatemalan general, whose name was totally unknown to most of the American public. Yet similar allegations surrounding the demise of one of America's most famous and popular military leaders of the 1940s have been of no interest to America's mainstream journalists.

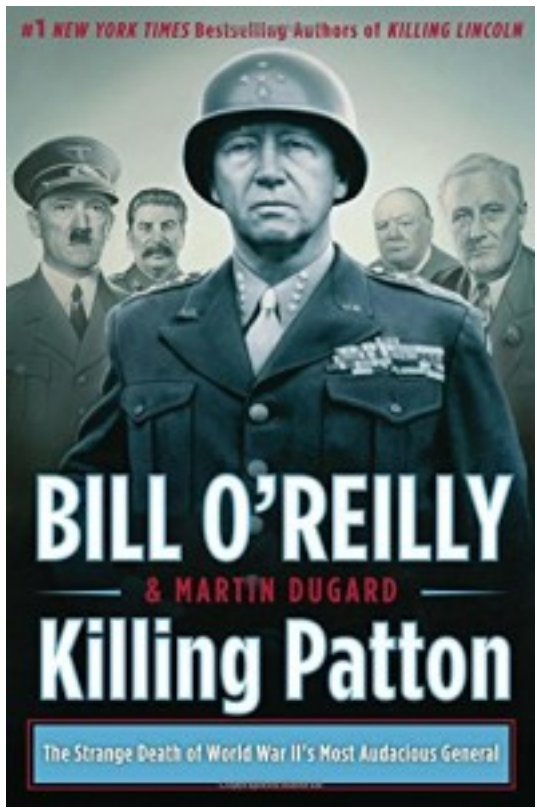
Once again, we must distinguish the two issues. Whether or not I am correct in believing that the case for Patton's assassination is overwhelming might certainly be disputed. But the fact that the American media has completely failed to report these revelations is absolutely undeniable.

As mentioned, I had originally encountered this fascinating history a few years ago, and at the time had been too preoccupied with other matters to publish a column as I'd intended. But having decided to return to the topic, I quickly reread the book to refresh my memory, and found it even more persuasive than I had the first time round. Eight years after original publication, I still failed to find any coverage in our timorous mainstream newspapers, but given the enormous growth of looser web-based journalism, I wondered what might have appeared elsewhere.

Googling around a bit, I didn't find a great deal. A couple of times over the years, Wilcox had managed to place short pieces of his own

somewhere, including the *New York Post* in 2010 and in the *American Thinker* webzine in 2012, with the latter including mention of a possibly important new witness who had finally decided to come forth. But otherwise his astonishing book seems to have been entirely shoved down the memory-hole.

On the other hand, others have recently begun trying to take advantage of his research, while refashioning the narrative into one more likely to find favor within the American establishment and the media it controls.



#1 NEW YORK TIMES Bestselling Authors of KILLING LINCOLN
BILL O'REILLY
& MARTIN DUGARD
Killing Patton
The Strange Death of World War II's Most Audacious General

Most notable was Bill O'Reilly, the *FoxNews* pundit, who published *Killing Patton* in 2014, another in his series of popular history best-sellers co-authored by Martin Dugard. The very title itself challenged the official story of an accidental car crash, and I eagerly opened the book, only to be severely disappointed. The presentation seemed thin and padded, with perhaps 10% of the text merely rehashing the analysis provided by Wilcox while the remaining 90% represented a rather conventional historical summary of the Western Front near the end of the Second World War, including heavy coverage of the Nazi concentration camps, and with little of this material having any

connection to Patton. The only interesting part of the text seemed based on Wilcox's original research, and that relationship was heavily disguised by the total absence of any footnotes, with the only indication being a single short sentence near the end citing the Wilcox book as a very helpful summary of the conspiracy theories. Not unreasonably, the latter author seemed somewhat irritated at the lack of appropriate notice or credit he received.

O'Reilly's dumbed-down book sold over a million copies, with a title proclaiming Patton's assassination. But the resulting media coverage was still rather scanty and largely negative, criticizing the supposed indulgence of conspiracy theories. *Media Matters* summarized the reaction as Historians Rip O'Reilly's New Patton Book, and given the near-total lack of any documentation provided by O'Reilly, much of that criticism may not have been unreasonable. Thus, the media totally ignored a heavily documented and persuasive book, while attacking and ridiculing a weak one on the same subject, with this dual approach constituting an effective means of obscuring the truth.

America's opinion leaders tend to rely upon our most elite national newspapers for their knowledge of the world, and the only coverage I found in these of O'Reilly's best-seller was a rather odd opinion piece by *Washington Post* columnist Richard Cohen. Cohen seemed rather uninterested in the assassination question one way or another, but harshly condemned O'Reilly for devoting insufficient pages to discussing Patton's alleged anti-Semitism. Indeed, he almost implied that some of the remarks later found in Patton's private diaries were sufficiently nasty toward Jews that perhaps no American should even care whether our highest ranking general in Europe had been killed by his own government or anyone else. The mentality of our mainstream media these days is very strange indeed, and we live in the world it creates for us.

Most recently, the success of the O'Reilly book and our revived Cold War with Russia may have led to production of a new documentary making the case for Patton's assassination, but possibly reconstructing the facts with a distorted twist. Wilcox's original research had demonstrated that top American leaders organized Patton's assassination, though probably in conjunction with the Soviets. O'Reilly provided some of those facts in his book, but his media interviews airbrushed out the American role, simply declaring that Stalin killed Patton. And based on news reports, I wonder if this new documentary, apparently made without Wilcox's involvement, will similarly ignore the massive evidence of direct U.S. government involvement, while perhaps attempting to fix the blame

solely upon the nefarious Russians.

Finally, this important historical incident provides a useful means of evaluating the credibility of certain widely-used resources. For years I've emphasized to people that Wikipedia is absolutely worthless as a source of reliable information on any relatively "controversial" topic. Given Patton's enormous historical stature, it is hardly surprising that his Wikipedia entry is exceptionally long and detailed, running over 15,000 words, with nearly 300 references and footnotes. But this exhaustive exposition contains not the slightest suggestion of any suspicious aspects to his death. "Wiki-Pravda" indeed.

# Alexander Cockburn and the British Spies

August 29, 2016 • 2,700 Words

About a decade ago I'd gotten a little friendly with the late Alexander Cockburn, one of America's premier radical journalists and the founder of *Counterpunch*, a leading leftist webzine. With virtually all of America's mainstream media outlets endlessly cheerleading for the total insanity of our Iraq War, *Counterpunch* was a port in the storm, and gained considerable credibility in my eyes.

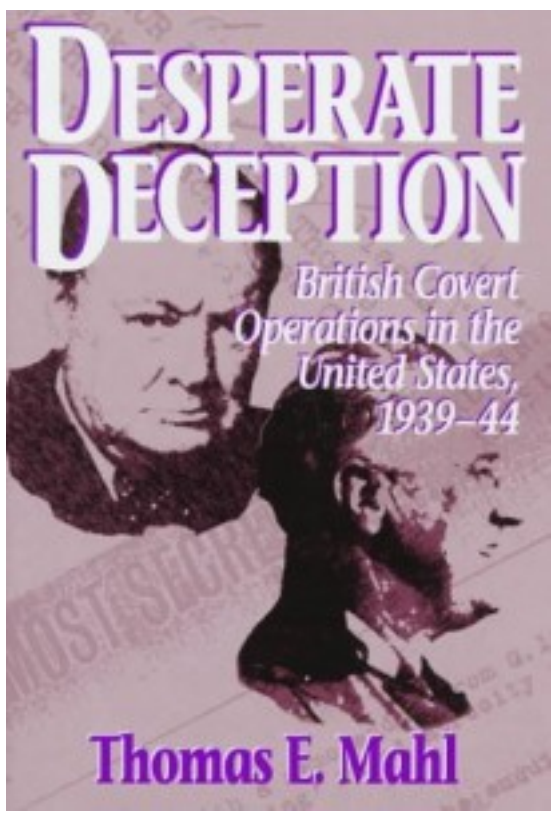
Although Alex lived in the far northern reaches of the Golden State, the rural North Coast close to the Oregon border where much of the local cash economy was based on illegal marijuana growing, he periodically took trips down to the Bay Area, and sometimes dropped by Palo Alto to have lunch with me when he did. Often as not, he brought along a book that he was in the middle of reading, and based on his strong recommendations, it usually ended up on my own list.

Sometimes my appraisal differed sharply from his own. For example, Shlomo Sand's international best-seller *The Invention of the Jewish People* was very widely praised in left-liberal and anti-Zionist circles, and attracted considerable attention in the mainstream media. But although I found many parts of the history extremely interesting, the central claim appeared to be incorrect. As far as I'm aware, there seems overwhelming genetic evidence that Europe's Ashkenazi Jews do indeed trace much of their ancestry back to the Holy Land, apparently being the descendants of a few hundred (presumably Jewish) Middle Easterners, mostly male, who settled in Southern Europe some time after the Fall of Rome and took local Northern Italian wives, afterward remaining largely endogamous for the next thousand-plus years of their growing presence in Central and Eastern Europe. However, being a historian rather than a genetic researcher, Prof. Sand was apparently unaware of this hard evidence, and focused upon much weaker literary and cultural indicators, perhaps also being somewhat influenced by his own ideological predilections.

On the other hand, some of Alex's other recommendations I found absolutely fascinating and quite persuasive. Once, he mentioned he was reading a book about the foreign spy network that had seized considerable control of the American political system just prior to our

entry into WWII. “Oh,” I said, “you mean the Soviet Communist spy network?” I had recently become better aware of the volume of evidence revealed by Venona decrypts. “No,” he answered with a smile, “the *other* foreign spy network, the one run by Britain.”

He explained that British spies had played a massive hidden role in getting America involved in the Second World War despite the overwhelming opposition of the citizenry, and very possibly had murdered a top Republican Party official as they secretly gained political control of the GOP and its presidential nominating process. Being himself from a family of British Communist Party members, he found it quite amusing that rival networks of British spies and Communist spies had quietly competed or cooperated for control of our own national government during that era, even while the totally ignorant and oblivious American sheep grazed contently, emitting an occasional “Baa!” now and again, and never noticed that the direction of their flock periodically changed in seemingly inexplicable ways.



So I went ahead and ordered the book, *Desperate Deception* by Thomas E. Mahl, and put it in my stack, though being busy with software

work, it was a couple of years until I finally got around to reading it. Unfortunately, by that time, Alex was no longer among us, so I couldn't drop him a note of thanks for the recommendation. As someone with merely a cursory knowledge of twentieth century American history, largely acquired from high school textbooks and newspaper articles, I found the material quite shocking, but based on a few conversations I've had, I suspect that many Americans, including those far more knowledgeable than myself, would react in much the same way.

These days, informed observers have grown a bit blasé at the notion of our country being manipulated by agents of a foreign power together with its influential domestic allies, and although the endless, Stalinesque standing ovations given by Congress to Israeli Premier Benjamin Netanyahu last year raised a few temporary eyebrows at the time, the incident was quickly forgotten. But back in the more innocent era of the 1930s, there was still a naive feeling that American elected officials should act in service to what they perceived as America's own national interests, and if the facts of Prof. Mahl's book had become known at the time, there surely would have been a serious political backlash.

Indeed, at numerous points the author notes that the puzzled political opponents of our involvement in the Second World War sensed that there seemed to be some unseen coordinating hand behind the individuals and forces arrayed against them, but they never guessed that it was simply a foreign intelligence service.

The history was that Britain and France had entered into a war against Germany, and soon found themselves at a stalemate or actually overmatched. Only America's entrance into World War I had turned the tide of that conflict, leading to an allied victory, and the same factor seemed necessary in the even more difficult second round. However, America's involvement in WWI had come to be seen by the American people in hindsight as a disastrous mistake, and the notion of going to war in Europe a second time was enormously unpopular. Hence a heavy secret campaign of political subversion and media manipulation was necessary to undermine the public figures opposing intervention and ensure that America would go to war even though very few Americans actually wanted to do so.

This task was rendered considerably more difficult by another factor only lightly touched upon by the author. During the period in question, an enormous amount of political influence was held by a network of Communist agents loyal to the Soviet Union, as

conclusively demonstrated many decades later by the declassification of the Venona decrypts. However, Stalin and Hitler had become allies just prior to the outbreak of the Second World War, and until the German invasion of Russia in June 1941, Communists were generally opposed to any American support for Britain or France, let alone direct military intervention. So for nearly the entire period in question, the British spies and agents of influence pushing for America to go to war sometimes encountered resistance from the Communist spies and agents of influence pushing in the opposite direction.

The audacity of the British spy ring was really quite remarkable, and partly explained by the enormous degree of control that they and their American allies exerted over most of the leading media outlets, which largely protected them against risk of damaging public disclosures. Under this umbrella of media immunity, documents were forged to embarrass political opponents, leading public opinion polls were manipulated or possibly even faked, and attractive women were deployed to sway prominent elected officials.

For example, I'd always seen the name of Sen. Arthur Vandenberg of Michigan cited as the Republican leader whose remarkable conversion from "isolationism" to interventionism and internationalism laid the basis for decades of bipartisan American foreign policy. And in a full chapter, Mahl provides persuasive evidence that Vandenberg's ideological shift was heavily facilitated by three successive women who served as his primary paramours over a number of years, all of them acting on behalf of British intelligence.

Mahl devotes another chapter to chronicling the repeated, ultimately successful attempts by these outside forces to defeat Rep. Hamilton Fish, entrenched for decades in his Upstate New York district, who served as the ranking Republican on the House Foreign Affairs Committee and was one of the nation's leading opponents of foreign intervention. Large amounts of outside money regularly flowed into his district along with massive, coordinated attacks by every available media outlet, levelling the most absurd accusations, including that he was backed by Nazi agents or even one himself, with these charges sometimes based on simple forgeries. In fact, the only foreign agents involved in his campaigns were the British spies secretly coordinating the anti-Fish effort.

Interestingly enough, among the top arguments advanced to stampede ordinary Americans into regarding Germany as a dangerous national threat was the claim that Hitler planned to violate the Monroe Doctrine by seizing control of Latin America, as proven by a secret

Nazi map indicating the eventual zones of military occupation. But Germany possessed a surface navy of negligible strength, so any attempt to cross the Atlantic Ocean then invade and conquer half the Western Hemisphere would have been a remarkable undertaking indeed, and naturally the map was fabricated by the British, possibly at the behest of the Roosevelt Administration. The individuals who forged the "Niger Yellowcake papers" to promote the Iraq War were mere pikers by comparison.

Another fascinating historical detail regards the creation of the OSS, the American intelligence service that served as the ancestor of the CIA. The FBI already existed as did America's military intelligence service, but those entrenched organizations were obviously much less vulnerable to external political influence, let alone foreign control. Therefore, most of the impetus behind the creation of the new OSS apparently came from elements of British Intelligence, who also helped select the top leadership, leading to interesting questions about where the primary loyalty of those latter individuals actually lay. Indeed, British agents often described OSS Director Bill Donovan as "our man" in their internal communications.

But perhaps the most remarkable story, totally unfamiliar to me, was the bizarre nature of the 1940 presidential race. Franklin Roosevelt had partly won his landslide reelection in 1936 by running as a strong opponent of intervention in any future European war, but in 1937 the economy had once again collapsed, including a new stock market crash, a return to near-record unemployment, and a widespread perception that despite unprecedented government spending, the vaunted New Deal had ultimately been proven unsuccessful. In addition, FDR's attempt to "pack" the Supreme Court had suffered a major bipartisan defeat in 1937, further undercutting his popularity and raising perceptions that his presidency had been a failure. As an indication of Roosevelt's unpopularity, the Republicans gained 80 House seats in the 1938 mid-term elections, one of the largest swings in U.S. history.

The 1939 outbreak of war in Europe provided a huge, welcome boost to the American economy, and also a potential excuse for Roosevelt to break every American political tradition and seek a third presidential term. But Roosevelt's support for military involvement in that conflict posed a major obstacle to such plans since all the leading Republican contenders were strong anti-interventionists, Sen. Robert Taft of Ohio foremost among them, as were the American people. So Roosevelt

would apparently either have to risk an election defeat or once again heavily commit himself to maintaining America's future military neutrality, thus restricting his future course of action if elected and also perhaps alienating some of his key backers, who were focused entirely on the need for America to quickly enter the war against Germany.

Obviously, the ideal situation would be if Roosevelt's Republican presidential opponent somehow happened to be his ideological twin on "internationalism," thereby giving the probable majority of "isolationist" voters no choice whatsoever in the voting booth. Powerful figures in the East Coast WASP Establishment wing of the Republican Party, including Henry Luce of the Time-Life media empire and Thomas Lamont of J.P. Morgan & Company, eagerly sought this exact result, but without either a potential Republican candidate or significant popular support, the effort seemed hopeless.

Yet when the 1940 party convention finally drew to a close on June 28th, the unexpected Republican presidential nominee, Wendell Willkie, exactly fulfilled that unlikely goal. He was also a rather strange choice in many other respects, being a somewhat politically obscure lifelong Democrat who had never previously held any elective office, nor had he even competed in any Republican primary. Experienced political observers at the time regarded the Willkie nomination as being among the most bizarre and baffling in American political history, with the redoubtable H.L. Mencken suggesting that Divine Intervention was the only possible explanation.

Mahl, however, points to more mundane factors. There exists enormous evidence of major skullduggery by British agents, including the total manipulation of the nomination process by the convention manager, who was their close ally. Microphones were sabotaged at crucial points and duplicate tickets printed to ensure that all the galleries were completely packed by loud Willkie partisans, whose enthusiasm helped sway wavering delegates. Success might have been very difficult without such illegal machinations, and interestingly enough, the gentleman who arranged them only acquired his position of authority when the original convention manager, an ardent Taft supporter, had suddenly collapsed and died several weeks earlier. This occurrence, seemingly so crucial for Willkie's nomination, may have been entirely fortuitous, but Mahl notes that the individuals recruited into the local British spy ring were explicitly warned that they might need to commit murder as part of their duties.

Despite Willkie's remarkable success at securing the nomination, his

presidential campaign itself proved a total disaster, with many of his erstwhile supporters quickly dropping away or even transferring their allegiance to Roosevelt. His history as a Democrat and his advocacy of an aggressive internationalism hardly inspired Republican voter enthusiasm, while his Wall Street background constituted a perfect foil for Roosevelt's populist positions. So despite enormous public doubts about Roosevelt, Willkie suffered a landslide defeat, thereby handling Roosevelt his third term.

The latter proved remarkably magnanimous in victory, becoming very friendly with Willkie, giving him several important appointments, notably to a top American position in Britain, and even considering him as a replacement for pro-Soviet Henry Wallace as his 1944 Vice Presidential choice and likely successor, before ultimately settling upon Harry S. Truman instead. Thus a lifelong Democrat came from obscurity to suddenly capture the Republican Presidential nomination in 1940 before nearly becoming the Democratic Vice Presidential nominee in 1944, which would have put him in the White House upon Roosevelt's death in 1945.

A glance at Wikipedia suggests that the psychic strain of having come so close to supreme power perhaps became too much for poor Willkie, who soon after being denied the Vice Presidency began suffering numerous heart attacks, finally collapsing and dying at age 52 just before the 1944 election. The entire strange history of these events brings to mind Lenin's emphasis on the tremendous benefits of creating or at least controlling one's own political opposition, and perhaps also underscores the possible health risks faced by individuals caught up in such schemes.

Mahl's monograph, based on his doctoral dissertation in diplomatic history at Kent State University, was published almost 20 years ago in Brassey's Intelligence & National Security Library, a respected specialty press, received some notable scholarly endorsements, and was briefly reviewed in *Foreign Affairs* and other mainstream journals. But the only extensive American coverage of this important work seems to have been in small ideological publications such as the paleoconservative *Chronicles* and the libertarian *Independent Review* and *Mises Review*, which conveniently provide much more detailed reviews and summaries of the material than I have presented above. However, despite no sign of a substantial refutation, I also see no indication that the research has ever been substantially incorporated into our histories of that era. For example, Willkie's 11,000 word Wikipedia entry contains an extensive bibliography and over 150 references, but includes no mention of Mahl's important research

findings.

It is hardly uncommon for a supposedly sovereign nation to have its political system or democratic elections subverted and controlled by the hidden actions of a foreign power, and the last century has been replete with such examples. But while I'm sure that the average educated Guatemalan or Columbian is perfectly aware of the numerous public policy manipulations that his unfortunate country suffered over the decades at the hands of the CIA, I doubt that too many of their American counterparts would guess that much U.S. history might also have been heavily influenced by the subtle interventions of one or more foreign intelligence agencies.

# How the CIA Invented "Conspiracy Theories"

September 5, 2016 • 2,600 Words

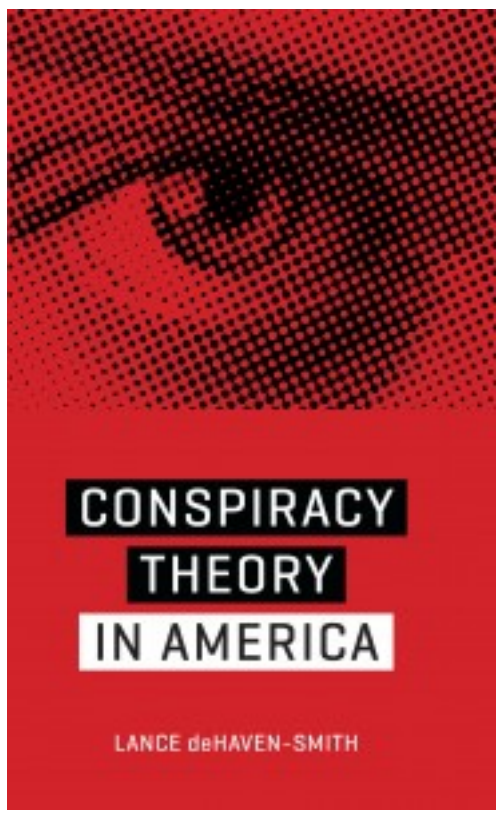
A year or two ago, I saw the much-touted science fiction film *Interstellar*, and although the plot wasn't any good, one early scene was quite amusing. For various reasons, the American government of the future claimed that our Moon Landings of the late 1960s had been faked, a trick aimed at winning the Cold War by bankrupting Russia into fruitless space efforts of its own. This inversion of historical reality was accepted as true by nearly everyone, and those few people who claimed that Neil Armstrong had indeed set foot on the Moon were universally ridiculed as "crazy conspiracy theorists." This seems a realistic portrayal of human nature to me.

Obviously, a large fraction of everything described by our government leaders or presented in the pages of our most respectable newspapers —from the 9/11 attacks to the most insignificant local case of petty urban corruption—could objectively be categorized as a "conspiracy theory" but such words are never applied. Instead, use of that highly loaded phrase is reserved for those theories, whether plausible or fanciful, that do not possess the endorsement stamp of establishmentarian approval.

Put another way, there are good "conspiracy theories" and bad "conspiracy theories," with the former being the ones promoted by pundits on mainstream television shows and hence never described as such. I've sometimes joked with people that if ownership and control of our television stations and other major media outlets suddenly changed, the new information regime would require only a few weeks of concerted effort to totally invert all of our most famous "conspiracy theories" in the minds of the gullible American public. The notion that nineteen Arabs armed with box-cutters hijacked several jetliners, easily evaded our NORAD air defenses, and reduced several landmark buildings to rubble would soon be universally ridiculed as the most preposterous "conspiracy theory" ever to have gone straight from the comic books into the minds of the mentally ill, easily surpassing the absurd "lone gunman" theory of the JFK assassination.

Even without such changes in media control, huge shifts in American

public beliefs have frequently occurred in the recent past, merely on the basis of implied association. In the initial weeks and months following the 2001 attacks, every American media organ was enlisted to denounce and vilify Osama Bin Laden, the purported Islamicist master-mind, as our greatest national enemy, with his bearded visage endlessly appearing on television and in print, soon becoming one of the most recognizable faces in the world. But as the Bush Administration and its key media allies prepared a war against Iraq, the images of the Burning Towers were instead regularly juxtaposed with mustachioed photos of dictator Saddam Hussein, Bin Laden's arch-enemy. As a consequence, by the time we attacked Iraq in 2003, polls revealed that some 70% of the American public believed that Saddam was personally involved in the destruction of our World Trade Center. By that date I don't doubt that many millions of patriotic but low-information Americans would have angrily denounced and vilified as a crazy conspiracy theorist anyone with the temerity to suggest that Saddam had *not* been behind 9/11, despite almost no one in authority having ever explicitly made such a fallacious claim.



These factors of media manipulation were very much in my mind a couple of years ago when I stumbled across a short but fascinating

book published by the University of Texas academic press. The author of *Conspiracy Theory in America* was Prof. Lance deHaven-Smith, a former president of the Florida Political Science Association.

Based on an important FOIA disclosure, the book's headline revelation was that the CIA was very likely responsible for the widespread introduction of "conspiracy theory" as a term of political abuse, having orchestrated that development as a deliberate means of influencing public opinion.

During the mid-1960s there had been increasing public skepticism about the Warren Commission findings that a lone gunman, Lee Harvey Oswald, had been solely responsible for President Kennedy's assassination, and growing suspicions that top-ranking American leaders had also been involved. So as a means of damage control, the CIA distributed a secret memo to all its field offices requesting that they enlist their media assets in efforts to ridicule and attack such critics as irrational supporters of "conspiracy theories." Soon afterward, there suddenly appeared statements in the media making those exact points, with some of the wording, arguments, and patterns of usage closely matching those CIA guidelines. The result was a huge spike in the pejorative use of the phrase, which spread throughout the American media, with the residual impact continuing right down to the present day. Thus, there is considerable evidence in support of this particular "conspiracy theory" explaining the widespread appearance of attacks on "conspiracy theories" in the public media.

But although the CIA appears to have effectively manipulated public opinion in order to transform the phrase "conspiracy theory" into a powerful weapon of ideological combat, the author also describes how the necessary philosophical ground had actually been prepared a couple of decades earlier. Around the time of the Second World War, an important shift in political theory caused a huge decline in the respectability of any "conspiratorial" explanation of historical events.

For decades prior to that conflict, one of our most prominent scholars and public intellectuals had been historian Charles Beard, whose influential writings had heavily focused on the harmful role of various elite conspiracies in shaping American policy for the benefit of the few at the expense of the many, with his examples ranging from the earliest history of the United States down to the nation's entry into WWI. Obviously, researchers never claimed that all major historical events had hidden causes, but it was widely accepted that some of them did, and attempting to investigate those possibilities was deemed

a perfectly acceptable academic enterprise.

However, Beard was a strong opponent of American entry into the Second World War, and he was marginalized in the years that followed, even prior to his death in 1948. Many younger public intellectuals of a similar bent also suffered the same fate, or were even purged from respectability and denied any access to the mainstream media. At the same time, the totally contrary perspectives of two European political philosophers, Karl Popper and Leo Strauss, gradually gained ascendancy in American intellectual circles, and their ideas became dominant in public life.

Popper, the more widely influential, presented broad, largely theoretical objections to the very possibility of important conspiracies ever existing, suggesting that these would be implausibly difficult to implement given the fallibility of human agents; what might appear a conspiracy actually amounted to individual actors pursuing their narrow aims. Even more importantly, he regarded "conspiratorial beliefs" as an extremely dangerous social malady, a major contributing factor to the rise of Nazism and other deadly totalitarian ideologies. His own background as an individual of Jewish ancestry who had fled Austria in 1937 surely contributed to the depth of his feelings on these philosophical matters.

Meanwhile, Strauss, a founding figure in modern neo-conservative thought, was equally harsh in his attacks upon conspiracy analysis, but for polar-opposite reasons. In his mind, elite conspiracies were absolutely necessary and beneficial, a crucial social defense against anarchy or totalitarianism, but their effectiveness obviously depended upon keeping them hidden from the prying eyes of the ignorant masses. His main problem with "conspiracy theories" was not that they were always false, but they might often be true, and therefore their spread was potentially disruptive to the smooth functioning of society. So as a matter of self-defense, elites needed to actively suppress or otherwise undercut the unauthorized investigation of suspected conspiracies.

Even for most educated Americans, theorists such as Beard, Popper, and Strauss are probably no more than vague names mentioned in textbooks, and that was certainly true in my own case. But while the influence of Beard seems to have largely disappeared in elite circles, the same is hardly true of his rivals. Popper probably ranks as one of the founders of modern liberal thought, with an individual as politically influential as left-liberal financier George Soros claiming to be his intellectual disciple. Meanwhile, the neo-conservative

thinkers who have totally dominated the Republican Party and the Conservative Movement for the last couple of decades often proudly trace their ideas back to Strauss.

So, through a mixture of Popperian and Straussian thinking, the traditional American tendency to regard elite conspiracies as a real but harmful aspect of our society was gradually stigmatized as either paranoid or politically dangerous, laying the conditions for its exclusion from respectable discourse.

By 1964, this intellectual revolution had largely been completed, as indicated by the overwhelmingly positive reaction to the famous article by political scientist Richard Hofstadter critiquing the so-called "paranoid style" in American politics, which he denounced as the underlying cause of widespread popular belief in implausible conspiracy theories. To a considerable extent, he seemed to be attacking straw men, recounting and ridiculing the most outlandish conspiratorial beliefs, while seeming to ignore the ones that had been proven correct. For example, he described how some of the more hysterical anti-Communists claimed that tens of thousands of Red Chinese troops were hidden in Mexico, preparing an attack on San Diego, while he failed to even acknowledge that for years Communist spies had indeed served near the very top of the U.S. government. Not even the most conspiratorially minded individual suggests that all alleged conspiracies are true, merely that some of them might be.

Most of these shifts in public sentiment occurred before I was born or when I was a very young child, and my own views were shaped by the rather conventional media narratives that I absorbed. Hence, for nearly my entire life, I always automatically dismissed all of the so-called "conspiracy theories" as ridiculous, never once even considering that any of them might possibly be true.

To the extent that I ever thought about the matter, my reasoning was simple and based on what seemed like good, solid common sense. Any conspiracy responsible for some important public event must surely have many separate "moving parts" to it, whether actors or actions taken, let us say numbering at least 100 or more. Now given the imperfect nature of all attempts at concealment, it would surely be impossible for all of these to be kept entirely hidden. So even if a conspiracy were initially 95% successful in remaining undetected, five major clues would still be left in plain sight for investigators to find. And once the buzzing cloud of journalists noticed these, such blatant

evidence of conspiracy would certainly attract an additional swarm of energetic investigators, tracing those items back to their origins, with more pieces gradually being uncovered until the entire cover-up likely collapsed. Even if not all the crucial facts were ever determined, at least the simple conclusion that there had indeed been some sort of conspiracy would quickly become established.

However, there was a tacit assumption in my reasoning, one that I have since decided was entirely false. Obviously, many potential conspiracies either involve powerful governmental officials or situations in which their disclosure would represent a source of considerable embarrassment to such individuals. But I had always assumed that even if government failed in its investigatory role, the dedicated bloodhounds of the Fourth Estate would invariably come through, tirelessly seeking truth, ratings, and Pulitzers. However, once I gradually began realizing that the media was merely "Our American Pravda" and perhaps had been so for decades, I suddenly recognized the flaw in my logic. If those five—or ten or twenty or fifty—initial clues were simply ignored by the media, whether through laziness, incompetence, or much less venial sins, then there would be absolutely nothing to prevent successful conspiracies from taking place and remaining undetected, perhaps even the most blatant and careless ones.

In fact, I would extend this notion to a general principle. Substantial control of the media is almost always an absolute prerequisite for any successful conspiracy, the greater the degree of control the better. So when weighing the plausibility of any conspiracy, the first matter to investigate is who controls the local media and to what extent.

Let us consider a simple thought-experiment. For various reasons these days, the entire American media is extraordinarily hostile to Russia, certainly much more so than it ever was toward the Communist Soviet Union during the 1970s and 1980s. Hence I would argue that the likelihood of any large-scale Russian conspiracy taking place within the operative zone of those media organs is virtually nil. Indeed, we are constantly bombarded with stories of alleged Russian conspiracies that appear to be "false positives," dire allegations seemingly having little factual basis or actually being totally ridiculous. Meanwhile, even the crudest sort of *anti-Russian* conspiracy might easily occur without receiving any serious mainstream media notice or investigation.

This argument may be more than purely hypothetical. A crucial turning point in America's renewed Cold War against Russia was the

passage of the 2012 Magnitsky Act by Congress, punitively targeting various supposedly corrupt Russian officials for their alleged involvement in the illegal persecution and death of an employee of Bill Browder, an American hedge-fund manager with large Russian holdings. However, there's actually quite a bit of evidence that it was Browder himself who was actually the mastermind and beneficiary of the gigantic corruption scheme, while his employee was planning to testify against him and was therefore fearful of his life for that reason. Naturally, the American media has provided scarcely a single mention of these remarkable revelations regarding what might amount to a gigantic Magnitsky Hoax of geopolitical significance.

To some extent the creation of the Internet and the vast proliferation of alternative media outlets, including my own small webzine, have somewhat altered this depressing picture. So it is hardly surprising that a very substantial fraction of the discussion dominating these Samizdat-like publications concerns exactly those subjects regularly condemned as "crazy conspiracy theories" by our mainstream media organs. Such unfiltered speculation must surely be a source of considerable irritation and worry to government officials who have long relied upon the complicity of their tame media organs to allow their serious misdeeds to pass unnoticed and unpunished. Indeed, several years ago a senior Obama Administration official argued that the free discussion of various "conspiracy theories" on the Internet was so potentially harmful that government agents should be recruited to "cognitively infiltrate" and disrupt them, essentially proposing a high-tech version of the highly controversial Cointelpro operations undertaken by J. Edgar Hoover's FBI.

Until just a few years ago I'd scarcely even heard of Charles Beard, once ranked among the towering figures of 20th century American intellectual life. But the more I've discovered the number of serious crimes and disasters that have completely escaped substantial media scrutiny, the more I wonder what other matters may still remain hidden. So perhaps Beard was correct all along in recognizing the respectability of "conspiracy theories," and we should return to his traditional American way of thinking, notwithstanding endless conspiratorial propaganda campaigns by the CIA and others to persuade us that we should dismiss such notions without any serious consideration.

# The KKK and Mass Racial Killings

September 19, 2016 • 3,200 Words

Over the last few decades, I doubt that any American political organization has received greater negative attention in our national news and entertainment media than the Ku Klux Klan, or KKK. For example, although white activist David Duke left that group over 35 years ago, the media still often identifies him as one of its former leaders, and partly as a consequence Duke's support for Donald Trump's presidential campaign has regularly been treated as headline news.

Such massive coverage may be objectively demonstrated. Googling "KKK" yields over 72 million results, considerably more than the joint total for "Communist" and "Communists," and well over twice what you get for "Communism." Such prominence seems rather excessive, given that throughout most of the 20th century, Communism controlled some one-third of the world's population, and the resulting political conflict periodically threatened to unleash global thermonuclear war. Even today, a self-described Communist Party governs China, a nation 1.4 billion strong, which by some measures has now passed the U.S. to become the world's largest economy. Meanwhile, the last time the KKK held any significant political power was almost 100 years ago, during its Midwestern heyday of the 1920s.

And if we focus on the sanguinary consequences of the two movements, the imbalance is even greater. The famous *Black Book of Communism*, published in 1991, claimed that across the 20th century, Communist regimes had racked up a peacetime total of roughly 100 million human fatalities, and although that latter figure has been widely disputed as a considerable exaggeration, the true number is surely in the many tens of millions, with merely the famine deaths induced by Mao's disastrous Great Leap Forward of 1959-1961 usually pegged at 35 million or more.

Meanwhile, the victims of the notorious KKK seem rather fewer in number. The Wikipedia entry for the KKK is over twice as long as that for Communism, and hardly seeks to airbrush the misdeeds of that violent organization, but only manages to provide some 15 murder victims, all listed by name, drawn from the combined decades of the 1950s and 1960s, which represented the height of the Klan's modern

power.  This apparent gap between 15 deaths and perhaps 70,000,000 or so seems rather wide.

Not only does the KKK total pale in comparison with Stalin and his considerable body-count, but during its two decades of greatest infamy all those hundreds or thousands of armed Klansmen accounted for fewer victims than the number sometimes sent to the Chicago city morgue over a long holiday weekend these days, let alone what various half-forgotten teenage spree-killers produced during their individual short rampages.  For example, a decade ago disgruntled Virginia Tech student Seung-Hui Cho killed 33 people within a couple of hours, and he hardly remains a household name these days. Meanwhile, the last of those infamous 15 KKK racial killings took place a full half-century ago.

A considerable disproportionality between media attention and actual activity seems undeniable.

However, there are obviously some mitigating factors in this critique. Communism never came to America in serious form, while the ideological foundations of our culture these days tend to regard racial killings by organized groups as particularly heinous offenses, especially when these are aimed at inflicting terror.  By contrast, lunatics attacking their classmates or drug-dealers disputing their business transactions are committing much more mundane offenses. So under this particular victimological standard, the 15 victims of the KKK over the two decades from 1950 more reasonably justify the massive attention they have received.

Furthermore, America has always been fascinated with killings that take place over an extended period of months or years, especially if they involve some sort of unusual pattern, with the monikers of strange serial killers often resonating for decades.  There was Richard Ramirez, the Los Angeles Night Stalker, an avowed Satanist who slaughtered at least fourteen victims, mostly in the Los Angeles area during 1985.  And who can forget Jeffrey Dahmer, the Milwaukee Cannibal, who killed and devoured some 17 young men in a career spanning a dozen years?  So the unusual circumstances or motivation of such murders can easily compensate for the relative lack of raw numbers, and surely this helps to explain the enormous attention paid to the KKK's rather meager list of actual victims.

As an extreme example of the importance of murder quality over murder quantity, there was the famed Zodiac Killer who prowled Northern California during the late 1960s and early 1970s, but was

never caught.  Although he may have accounted for as few as five actual victims, the sensational nature of the case inspired several movies and many dozens of books, while the fictionalized plotline of a serial killer who sends taunting letters to the newspapers has probably been repeated in scores of television crime episodes and films.  As a child growing up in Southern California, the phrase "Zodiac Killer" was certainly familiar to me.

But oddly enough, another long series of killings centered in that same time and place has received far less attention.  When I first encountered mention of the "Zebra killings" some years ago, the term was completely unfamiliar to me, and due to the similarities in name and location, I initially wondered whether it might be an alternate designation for the Zodiac attacks.  But despite the chronological and geographical overlap, the Zebra case was actually quite different, and given its explosive details the almost total absence of any subsequent media attention is really quite curious.

Indeed, one advantage of exploring the Zebra killings is there exists only one detailed, somewhat contemporaneous account, and a couple of years ago with my curiosity getting the better of me, I finally ordered the book from Amazon.  *Zebra* was published in 1979 by Clark Howard, an award-winning crime writer, who drew extensively on newspaper archives, court testimony, and personal interviews, with his text running over 400 pages.

Clark Howard
NO ONE WAS SAFE...IT WAS THE MOST BRUTAL AND BIZARRE MOLE WAR EVER LAUNCHED... IN AMERICA... IN OUR TIME!
Zebra
TERRIFYINGLY TRUE!

The story of the Zebra killers almost sounds like something out of a movie, although no movie was ever made. For decades, the Nation of Islam—the so-called ﷺBlack Muslimsﷺ—had been preaching that whites were ﷺdevils,ﷺ the product of a mad scientist's controlled-breeding experiment, and that killing such ﷺdevilsﷺ was a virtuous religious act. Then, some time in 1972, certain elements of the sect decided to transform religious dogma into actual practice, and began an organized campaign to randomly kill as many white men, women, and children as they could, with the attacks occurring throughout California but especially centered in the Bay Area and the city of San Francisco. One of the alleged motives was to terrorize the local whites into eventually fleeing that city, thereby allowing the establishment of a black-dominated metropolis.

The black attackers typically went out alone or in pairs to commit the killings, usually selecting any seemingly vulnerable victims on the streets at dusk or in the dark, with their weapons of choice being guns, hatchets, or machetes. Sometimes, victims were kidnapped and brought back to safe-houses to be tortured and killed by the entire group, with their bodies afterward dismembered and discarded.

According to the later court testimony, black participants each needed to kill a total of nine white men to be awarded the coveted title of "Death Angel," earning them the right to have their photos displayed in the Black Muslim meeting halls, while roughly double points were awarded for slaughtering white women or children, on the grounds that such killings were more psychologically difficult. Based on the number of such distinctive homicides—well-dressed black men randomly attacking whites on the street—police officials estimated that there were over 70 such killings throughout California, though based on his extensive research Howard himself believed that the true statewide total may have been close to 270 dead victims.

The period of the killings lasted for almost half a year, and once the newspapers and public grew aware of the situation, the city of San Francisco became gripped by a sense of terror, with public officials desperate to crack the case. Sometimes even politically-connected individuals fell victim, with future mayor Art Agnos barely surviving a random gunshot attack. In desperation, Mayor Joseph Alioto, a staunch liberal, initiated stop-and-search patrols that targeted a majority of the local population of adult black males as possible killers. Eventually, eight of the suspects were arrested with the aid of an informant, with four of these being convicted and sentenced to life, at which point the attacks ceased. But it appears that the majority of the participants were never caught, let alone punished.

*Zebra* may be purchased for as little as $4 on Amazon, shipping included, and also found online both as a PDF and in various other formats at Archive.org. But for those too busy to read it, a much shorter summary of the story may be found in an article entitled "Remembering the Zebra Killing" published in 2001 by conservative writer James Lubinskas, with his presentation closely matching the book's facts, while the *San Francisco Chronicle* also ran a short retrospective around the time of the 2002 DC Sniper Attacks. There are also a handful of other small websites here and there, discussing the case and republishing some newspaper articles, including coverage of the Zebra killings in other cities.

Meanwhile, the events themselves have almost totally disappeared from public memory. When noted author David Talbot published his widely-praised 2012 book *Season of the Witch* covering that general era of San Francisco history, he included a discussion of the Zebra killings, and some knowledgeable San Francisco natives mentioned that it was the first time they had ever heard of the story. Indeed, the complete absence of any subsequent media coverage or investigation forced Talbot, a mainstream liberal, to cite an obscure white racialist

blogsite devoted to the Zebra case as one of his only sources of documentary information on the wave of murders.

Not only did the Zebra killings represent the greatest instance of racially-motivated killings in modern American history, but the number of victims was quite possibly greater than the combined total for all other such examples over nearly the last 100 years of our history. Based on that reality, the near-absolute media blackout has been quite remarkably Orwellian and deeply disturbing. Prior to the development of the Internet, neither I nor almost anyone else would have ever encountered this important history, and I suspect that if anyone had presented us with the true facts back then, his claims might easily have been dismissed as the ravings of a lunatic.

We naively tend to assume that our media accurately reflects the events of our world and its history, but instead what we all too often see are only the tremendously distorted images of a circus fun-house mirror, with small items sometimes transformed into large ones, and large ones into small. The contours of historical reality may be warped into almost unrecognizable shapes, with some important elements completely disappearing from the record and others appearing out of nowhere. I've often suggested that the media creates our reality, but given such glaring omissions and distortions, the reality produced is often largely fictional. Our standard histories have always criticized the ludicrous Soviet propaganda during the height of Stalin's purges or the Ukrainian famine, but in its own way, our own media organs sometimes seem just as dishonest and absurd in their own reporting. And until the availability of the Internet, it was difficult for most of us to ever recognize the enormity of this problem.

Just a couple of weeks ago it was discovered that an attractive white teenage girl had been kidnapped by a group of black men in Florida, held captive and gang-raped for days, then finally killed and discarded, with her body fed to alligators. I found no mention of this grotesque tale in any of my major national newspapers, even as *The New York Times* reported that Hollywood was in the planning stages of three different major movies about the infamous Emmett Till murder case from 60 years ago. By hiding certain events and heavily emphasizing others, our media apparatus can create any desired picture of the world, and until recently almost none of us would have been the wiser.

The Black Lives Matter movement has increasingly dominated our

political discourse for the last couple of years, and its protests have led to major shifts in policing policy, with some critics claiming that these changes have been responsible for a large, unexpected spike in urban homicides in some heavily black cities. But as near as I can tell, many of the major incidents sparking that movement were more or less complete media hoaxes, and quickly revealed as such to anyone who even casually consulted the unfiltered information available on the Internet, thereby avoiding the dishonest MSM gatekeepers.

For example, Trayvon Martin seems to have been a violent young thug and his antagonist, George Zimmerman, a half-Hispanic Dudley-Do-Right, whose main offense was attempting to defend himself while at risk of being beaten to death after he was attacked late at night without provocation in his own community. Similarly, Michael Brown of Ferguson fame was a gigantic, thuggish criminal, who casually committed the strong-arm robbery of a convenience store at night, then suddenly attacked the local police officer who attempted to stop and question him soon afterward.

These and many of the other BLM incidents would hardly seem likely to inspire mass public outrage, whether among blacks or anyone else, except that our dishonest media successfully transformed them into things they were not, thereby agitating the ignorant and the gullible, with prominent media pundits sometimes themselves stunned at the total avoidance of the true facts. I have little doubt that during the 1930s Soviet *Pravda* managed to instill boiling outrage among ordinary Russians when it fabricated all the monstrous crimes and horrific treacheries purportedly committed by the Trotskyite wreckers and other political deviationists.

In fact, the evidence suggests that the overwhelming majority of all racially-motivated violent attacks in America each year are committed by blacks, usually against whites, though sometimes against Asians or Hispanics. But these attacks are almost always ignored by the media, while the newscasters and politicians seem almost desperate to shine a spotlight on any that occur in the opposite direction, even if they are almost nowhere to be found. Indeed, a few years ago I pointed out that for decades the statistical correlation across all our urban centers between the prevalence of blacks and the prevalence of serious crime has been among the highest found anywhere in the social sciences, strongly suggesting that marginal urban crime is essentially a black phenomenon. But individuals who form their view of the world primarily from our mainstream media would probably remain unaware of these important facts. Before the Internet, only gossip and rumor might have challenged media-endorsed falsehoods.

A pattern of blatant dishonesty that is too large and continues for too long produces obvious consequences. On a whole range of issues, certainly including racial ones, the American media may be fast approaching the point of possessing negative credibility, with increasing numbers of people tending to assume that the facts may be exactly opposite to what the media claims.

This is hardly unprecedented. During the 1970s I read Edgar Snow's fascinating books on Maoist China, wherein a shrewd peasant once told the author how easy it was to disentangle reality from official news reports: if the media launched a huge propaganda campaign emphasizing the tremendous safety of Chinese railways, then surely some horrific train wreck must have recently occurred. It's sad to consider that many Americans may be beginning to follow similar rules.

Consider a biological metaphor. When soft flesh suffers a serious wound, scar tissue protectively forms, and the eventual result is a new skin integument usually tougher and more resistant than the original. Thus, long after the damage has been repaired, left behind is a permanent, telltale marker of defensive overcompensation. Media narratives aimed at hiding unpleasant facts sometimes seem to follow that same pattern of overcompensation, producing an inverted reality that may provide a useful clue to the suppressed truth.

For example, last year I published an article examining the considerable evidence that John McCain's true wartime record in Vietnam may have been one of a notorious enemy collaborator, but that the dishonest effort to obscure or excuse the reality of his treachery took on a life of its own, and growing enormously over time, eventually established him in the mind of the public as one of America's most patriotic war-heroes.

Or consider the fascinating historical case of Emmett Till, mentioned earlier, whose murder in 1955 became the archetypal case of an innocent black youngster lynched by murderous Southern whites, perhaps even lending some inspiration to Harper Lee's public school classic *To Kill a Mockingbird*. There was enormous national media coverage of the Till murder, which uniformly reported that the black fourteen-year-old child had merely made rude and provocative remarks to the young wife of a white shopkeeper—a "Wolf whistle" —leading to his abduction and brutal killing. Yet oddly enough, only long afterward did it emerge out that his father, a violent criminal, had been executed for multiple rapes and murder, and that Till himself, weighing 150 pounds and quite large and muscular for his

age, also had a violent history. Indeed, these facts had remained totally unknown to me until quite recently.

When we discover that the media has shamelessly concealed certain potentially significant details, we may naturally wonder what else might have remained permanently hidden in those pre-Internet days. I've sometimes wondered whether Till's actions may have been far more substantial than merely a harmless "wolf whistle," perhaps even amounting to some sort of sexual assault, with his killing therefore being the sort of rough justice not uncommon in backward rural communities. Under such a hypothetical scenario, the husband of his victim would surely have made every effort to conceal from public knowledge the terrible indignity of the actual attack his wife had suffered. Perhaps such disturbing speculation is mistaken, but given the revealed pattern of deception, I do not think it is entirely unwarranted. In pre-Internet days, Trayvon Martin and Michael Brown might have easily joined Till in the roster of tragically martyred youngsters.

A long history of overwhelming media dishonesty may produce broader consequences that many may find distressing. The public remarks of Donald Trump often seem quite ignorant or even ridiculous, and surely no presidential candidate in the last one hundred years has been subjected to such strong and uniformly hostile media coverage. Yet the insular members of the Fourth Estate have been stunned that their endless attacks and denunciations have had so little impact upon public opinion, with Trump having recently regained the national lead in several presidential polls. Surely journalists must realize that decades of deceit have stretched their credibility past the breaking point on a whole range of sensitive issues, with huge numbers of voters simply disregarding anything said about Trump in what they consider "the lying press."

Once Americans conclude that our supposedly objective media functions merely as a corrupt propaganda machine, why should the statements of prominent establishment pundits or reporters count for anything more than the sarcastic Tweets of some angry, anonymous blogger? Those who have allowed the currency of journalistic integrity to become totally debased have only themselves to blame when they discover it is no longer accepted by the general public.

# The Destruction of TWA Flight 800

September 26, 2016 • 2,800 Words

Reconstruction of TWA Flight 800. Credit: Wikimedia Commons

Some years ago as I became increasingly aware of the severe dishonesty of our mainstream media on all sorts of controversial topics, I began telling a joke to a few of my friends.

Suppose, I would say, that I happened to be out walking one pleasant afternoon in Palo Alto, and suddenly heard a gigantic explosion in the general direction of Mountain View, soon followed by a huge pillar of smoke rising towards the sky. Being busy with my own work, I might have no time to bother investigating, and merely wondered what surprising story the front pages of my morning newspapers would reveal as the cause behind those dramatic events. But when I eagerly opened those papers the following day, mention of the explosion was nowhere to be found, either on Page One or anywhere else, even in my own local *San Jose Mercury News*. So unless I somehow persuaded myself that I had simply imagined the whole thing, I would henceforth stop believing anything I read—or failed to read—in my once-trusted news outlets.

I thought my allegorical fable rather amusing, and repeated it on a

number of occasions. But quite recently I came across a rough counterpart in real life, a remarkable tale that had almost completely escaped my attention for over twenty years.

When I used to recall the leading events of 1996, what came to mind was Bill Clinton's triumphant reelection campaign in the wake of the Oklahoma City bombing and political overreach by Newt Gingrich's Congressional Republicans. Perhaps there had also been some sort of plane crash on the East Coast, though none of the details were sharp or memorable in my mind. But in fact, the sudden mid-air explosion of TWA Flight 800 on a New York to Paris route was actually voted the top national news story of that year, ranking above the presidential campaign, while the 230 fatalities made it by far New York's worst disaster of the twentieth century, and the second worst airline tragedy in American history to that date. Indeed, some journalists at the time suggested that the resulting media coverage had eclipsed that of any other transportation calamity since the sinking of the *Titanic* almost a century earlier.

I had almost forgotten the story of that doomed airliner when I opened my morning edition of the *New York Times* in mid-July 2013 and read a short review in the Arts Section, favorably discussing a new television documentary presenting the "conspiracy theory" that the plane had been destroyed by a missile rather than by an accidental fuel tank explosion as the government investigation had firmly concluded at the time, a verdict strongly affirmed by both the news and editorial pages of the *Times*. I had recently published "Our American Pravda" and an eminent mainstream academic who appreciated my piece soon dropped me a note pointing to a website discussion of the details of the plane crash, about which I knew nothing. Being preoccupied with other matters, I could only glance at the material, which shocked me, but now that I've gone back and spent some time on the topic, the story turns out to be a truly remarkable one.

The outline of facts is hardly complicated. Soon after taking off from New York's JFK Airport on July 17, 1996, TWA Flight 800 suddenly exploded in the air just off Long Island. So enormous a loss of life naturally produced an immediate scrambling of numerous federal agencies to investigate the cause, and with widespread fears of terrorism, the FBI launched the largest, most complex investigation in its entire history, deploying some 500 field agents to the area. The investigators soon gathered a copious quantity of seemingly consistent evidence.

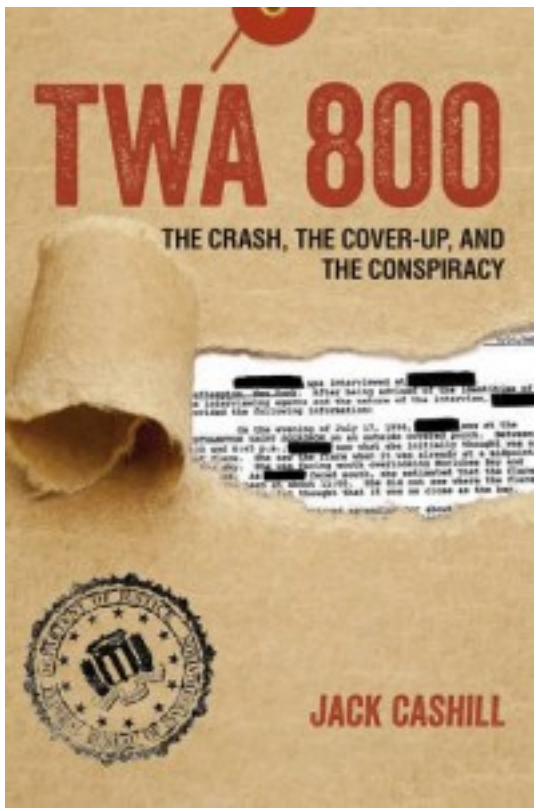
Large numbers of local witnesses were immediately interviewed by the swarm of federal agents, with 278 of them reporting that they saw a streak of light, much like a missile, shoot up into the sky in the direction of the aircraft just before the huge explosion. Employees at the local FAA radar installation immediately reported to the government that they had seen what appeared to be a missile closing with the airliner just before it exploded, and other installations produced similar radar records. When tests were eventually performed on the plane wreckage, traces of explosive chemicals were found, exactly the sort used in the warhead of a missile, as well as some reddish-orange chemical residue that a laboratory later identified as likely missile exhaust propellant. An enormous effort was made to locate every possible piece of the wreckage, and for many of these, the contours of the damage indicated an initial explosion external to the plane. Almost immediately after the disaster, a bidding-war allegedly broke out between the national television networks for an amateur home-video showing a missile striking and destroying TWA 800, with the tape eventually being sold for more than $50,000 and briefly broadcast on the MSNBC cable news channel before reportedly being seized as evidence by FBI agents. In addition, a local resident provided a still photo taken at the time showing what seemed to be a missile rising toward the aircraft.

Based on all this initial evidence, many of the early news stories reported that the plane had probably been destroyed by a missile, with widespread speculation about whether the calamity was due to terrorist action or instead accidental friendly fire from one of the U.S. naval warships operating in the vicinity. Given the extreme sensitivity of the topic, government officials urged the media to keep an open mind until the full investigation was completed. However, the public debate sometimes turned rancorous, with some individuals soon alleging that a government cover-up was in the works. Eventually, the CIA was brought into the investigation, given its tremendous expertise in certain matters.

After more than a year of detailed research, the government investigation finally concluded that no missile could possibly have been involved, with all the eyewitnesses having been misled by what amounted to an optical illusion caused by the explosion of the aircraft. That explosion itself had been entirely spontaneous, probably caused by a random spark igniting one of the gas tanks. Given the controversy in the case, the CIA helpfully produced a computer animation showing the official reconstruction of the events, which was endlessly broadcast by our news media to explain the disaster to the public. The simulation showed the jetliner spontaneously exploding

in mid-air, with no external cause, and just to further clarify matters, the CIA animators also inserted an explanatory message in large text: "There Was No Missile." The *New York Times*, and nearly all our other mainstream media repeatedly echoed this same simple conclusion in all their stories and headlines.

The vast majority of our sheep-like population absorbed the simple media message "No Missile" and went back to watching their football games and celebrity music videos, being greatly relieved to know that well-maintained 747 jumbo jets flown by leading national airlines can occasionally explode in mid-air without any external cause.



However, various disgruntled "conspiracy theorists" refused to accept these conclusions, and returned to their "crazy missile conspiracy theories," thereby earning the hearty ridicule of the entire mainstream media, led by the *New York Times*. These conspiratorial suspicions even extended to the U.S. navy, which had apparently been staging military exercises in the near vicinity of the calamity, exercises that some claimed including the test-firing of anti-aircraft missiles. Indeed, a local resident later provided a home video clearly showing a

missile being fired in that exact same area a few days earlier during previous naval exercises.

The entire remarkable history of this incident is persuasively set forth in a excellent twentieth-anniversary book published earlier this year by investigative journalist Jack Cashill, who has been following the case since the late 1990s, having co-authored a previous book in 2003 and also produced an earlier 2001 television documentary *Silenced*, now available in its entirely on YouTube.

In addition, the 2013 television documentary by a former CBS producer, whose favorable review by the *New York Times* marked my first introduction to the topic, was discussed at length and substantially excerpted by *NPR*'s Amy Goodman at *Democracy Now!*

http://www.democracynow.org/embed/story/2013/6/20/did_us_govt_lie_about_twa

Cashill is strongly affiliated with conservative publications, while someone like Goodman clearly leans toward the left, but the question of whether an American jetliner was destroyed by a missile, and the facts then covered up by the government is a non-ideological matter, so their perspectives seem almost identical.

For anyone having less than absolute faith in the official pronouncements of our government and our media, the likely reality of what happened is hardly difficult to guess, and for those who currently maintain such naivete, I suspect it will quickly dissipate if they choose to watch the documentaries or read the books. But the loss of TWA Flight 800 is surely of no great importance to our country. Accidents do happen. A large and energetic military, eager to test its latest missile weapons, perhaps carelessly and fatally crossed paths with hundreds of unlucky travelers on their way to Paris. Some 30,000 Americans die each year in fatal car crashes, and risks are inevitable in our modern industrial society.

However, from a broader perspective, I believe that the truly horrifying aspect of the incident is the tremendous ease with which our government and its lapdog media managed to so utterly suppress the reality of what had happened—an American jumbo jet shot down by a missile—and did so although this occurred not in some obscure, faraway foreign land, but within the very sight of Steven Spielberg's home in the exclusive Hamptons, on a flight that had just departed New York City, and despite such overwhelming physical evidence and hundreds of direct eye-witnesses. The successful cover-up is the important story, and constitutes a central subtext in all of the books and documentaries on the disaster

Given the eyewitness testimony and other factors, it is hardly surprising that many of the initial media stories either directly referred to a missile strike or at least mentioned it as one of the main possibilities, and indeed there is some evidence that top government leaders initially assumed a terrorist attack. But President Bill Clinton was locked in the middle of his reelection campaign, and while the slaughter of Americans by terrorists might unify a nation, disasters brought about by careless military action would surely have had the opposite political impact. So it seems likely that once terrorism was ruled out and the American military believed responsible, a direct order quickly came down from the highest levels to make the missile and all evidence supporting it disappear, with all our supposedly independent federal agencies, especially the FBI, bowing to that primary directive.

As part of the standard investigation, all the debris were gathered and stored at a hangar for examination, but FBI agents were discovered spiriting away some of the most tell-tale pieces, or even caught in the wee hours of the morning hammering them into a shape that would suggest an internal rather than an external explosion. The amateur video showing the missile strike was only briefly broadcast by a cable

news channel before being seized by government agents. When an investigative journalist acquired debris containing apparent missile residue and passed it along to a producer at CBS News, the evidence was quickly confiscated, with the journalist and his wife even being arrested, prosecuted, and convicted for violating an obscure law enacted to prohibit bystanders from removing souvenirs from the scene of a disaster; the veteran CBS producer who accepted the material was vilified as a "conspiracy theorist" and soon forced out of her job, her career destroyed. The written FBI reports of 278 eyewitness statements describing the missile attack were completely ignored, and in a number of cases, later statements were actually fabricated, falsely suggesting that crucial witnesses had revised or recanted their earlier testimony.

These particular examples only scratch the surface of the massive amount of coordinated government fraud and deception that was marshalled to make a missile strike seen by hundreds of witnesses officially disappear from the historical record, and transform the destruction of TWA Flight 800 into a rather mysterious and spontaneous mid-air explosion. The *New York Times* in particular became the primary mouthpiece of the official "See No Missile" party-line, repeatedly denigrating and ridiculing all those who resisted this total rewriting of the facts and history.

This gatekeeper role of the *Times* in the cover-up became particularly crucial once the high-profile figure of Pierre Salinger entered the controversy. Salinger ranked as a full-fledged member of the political-media establishment elite, having served as President Kennedy's press secretary and one of the most visible public figures in Camelot, then briefly as an appointed U.S. Senator from California before becoming a prize-winning journalist and the Paris Bureau Chief for ABC News. Himself half-French by birth, he had many connections to the leadership of that country, which was galvanized by the large number of French victims on the flight. French intelligence became involved, quickly acquiring some of the same voluminous missile-related evidence suppressed by its US counterpart, and passed him the information. Cashill notes that Salinger was a loyal Democrat, and perhaps as a consequence he sat on the story until after Clinton was safely reelected in November, then attempted to break it, publishing a long expose in *Paris Match*, one of France's highest-circulation popular magazines.

If Salinger had hoped his prestigious standing and long journalistic record would insulate him from attacks, he was sorely mistaken, and instead the threat his stature and credibility posed to the cover-up

unleashed an unprecedented barrage of insult, ridicule, and invective, with the *New York Times* running 18 consecutive articles attacking him, and America's leading news magazines, *Time* and *Newsweek* adding their own denunciations. Such remarkable vilification may have partly been aimed at dissuading any other prominent figures from similarly breaking ranks and following Salinger's lead in exposing the true facts, and if so, the effort succeeded and the cover-up held.

Prior to Salinger's regime disloyalty, he had regularly appeared on leading American television news broadcasts and his opinions were treated with the great deference accorded to a highly-respected elder statesman; afterward he was purged and blacklisted, shunned by our elite media as a "conspiracy nut." Indeed, upon his death a few years later, the disloyalty he had shown to his establishment colleagues seriously tainted his *NYT* obituary, which closed by describing the "strange turn" he had taken in advocating theories based upon "discredited" evidence.

I don't doubt that numerous other prominent figures quietly took the lesson of Salinger's defenestration to heart, much as high-ranking Soviet leaders noted the dire implications of questioning Stalin's pronouncements. Indeed, I personally know of at least a couple of individuals prominently situated in our current elite establishment whose private views on various controversial topics would surely rank as "utterly conspiratorial" but who remain extremely reluctant to have those views become generally known.

Or take another example, even closer to me. My old friend Bill Odom, the three-star general who had run the NSA for Ronald Reagan, clearly ranked in the upper reaches of the DC national security establishment in the early 2000s, serving as Director of National Security Policies at the Hudson Institute and an adjunct professor at Yale. Yet his strongly discordant views on the Bush response to 9/11 and the preparations for the Iraq War caused him to be totally blacklisted from major media access, reduced to publishing his dissenting opinions on an obscure website or in the pages of small, socialistic quarterlies.

When naive individuals suggest that maintaining a large government conspiracy in America is simply impossible because "somebody would have talked" perhaps they should consider the implications of this incident, which occurred so close to the media capital of the world. And if they ever decide to trust Wikipedia on any remotely controversial topic, they should consult the 10,000 word Wikipedia article on TWA Flight 800, comparing that exhaustive presentation

with the simple facts provided in this article, or the wealth of additional information in the numerous books and documentaries upon which my treatment was based.

The old Soviet Union was notoriously reluctant to ever acknowledge serious government errors, but its propaganda machinery was of mediocre quality, routinely ridiculed both in the West and among its own citizens. Surely, their Politburo members and *Pravda* editors would have been green with envy at how easily our own American Regime and its media minions suppressed the true story of TWA Flight 800, shot down by a missile just twelve minutes after it departed JFK Airport in New York City.

# Breaching the Media Barrier

October 24, 2016 • 2,500 Words

A couple of years ago, I launched my *Unz Review*, providing a wide range of different alternative perspectives, the vast majority of them totally excluded from the mainstream media. I've also published a number of articles in my own *American Pravda* series, focusing on the suspicious lapses and lacunae in our media narratives.

The underlying political strategy behind these efforts may already be apparent, and I've sometimes suggested it here and there. But I finally decided I might as well explicitly outline the reasoning in a memo as provided below.

**The Mainstream Media is the Crucial Opposing Force**

Groups advocating policies opposed by the American establishment should recognize that the greatest obstacle they face is usually the mainstream media.

Ordinary political and ideological opponents surely exist, but these are usually inspired, motivated, organized, and assisted by powerful media support, which also shapes the perceived framework of the conflict. In Clauswitzian terms, the media often constitutes the strategic "center of gravity" of the opposing forces.

**The Media Should Be Made a Primary Target**

If the media is the crucial force empowering the opposition, then it should be regarded as a primary target of any political strategy. So long as the media remains strong, success may be difficult, but if the influence and credibility of the media were substantially degraded, then the ordinary opposing forces would lose much of their effectiveness. In many respects, the media creates reality, so perhaps the most effective route toward changing reality runs through the media.

**Discrediting the Media Anywhere Weakens It Everywhere**

The mainstream media exists as a seamless whole, so weakening or discrediting the media in any particular area automatically reduces its influence everywhere else as well.

The elements of the media narrative faced by a particular anti-establishment group may be too strong and well-defended to attack effectively, and any such attacks might also be discounted as ideologically motivated. Hence, the more productive strategy may sometimes be an indirect one, attacking the media narrative elsewhere, at points where it is much weaker and less well-defended. In addition, winning those easier battles may generate greater credibility and momentum, which can then be applied to later attacks on more difficult fronts.

**A Broad Alliance May Support the Common Goal of Weakening the Media**

Once we recognize that weakening the media is a primary strategic goal, an obvious corollary is that other anti-establishment groups facing the same challenges become natural, if perhaps temporary, allies.

Such unexpected tactical alliances may drawn from across a wide range of different political and ideological perspectives—Left, Right, or otherwise—and despite the component groups having longer-term goals that are orthogonal or even conflicting. So long as all such elements in the coalition recognize that the hostile media is their most immediate adversary, they can cooperate on their common effort, while actually gaining additional credibility and attention by the very fact that they sharply disagree on so many other matters.

The media is enormously powerful and exercises control over a vast expanse of intellectual territory. But such ubiquitous influence also ensures that its local adversaries are therefore numerous and widespread, all being bitterly opposed to the hostile media they face on their own particular issues. By analogy, a large and powerful empire is frequently brought down by a broad alliance of many disparate rebellious factions, each having unrelated goals, which together overwhelm the imperial defenses by attacking simultaneously at multiple different locations.

A crucial aspect enabling such a rebel alliance is the typically narrow

focus of each particular constituent member. Most groups or individuals opposing establishment positions tend to be ideologically zealous about one particular issue or perhaps a small handful, while being much less interested in others. Given the total suppression of their views at the hands of the mainstream media, any venue in which their unorthodox perspectives are provided reasonably fair and equal treatment rather than being ridiculed and denigrated tends to inspire considerable enthusiasm and loyalty on their part. So although they may have quite conventional views on most other matters, causing them to regard contrary opinions with the same skepticism or unease as might anyone else, they will usually be willing to suppress their criticism at such wider heterodoxy so long as other members of their alliance are willing to return that favor on their own topics of primary interest.

**Assault the Media Narrative Where It is Weak Not Where It Is Strong**

Applying a different metaphor, the establishment media may be regarded as a great wall that excludes alternative perspectives from the public consciousness and thereby confines opinion to within a narrow range of acceptable views.

Certain portions of that media wall may be solid and vigorously defended by powerful vested interests, rendering assaults difficult. But other portions, perhaps older and more obscure, may have grown decrepit over time, with their defenders having drifted away. Breaching the wall at these weaker locations may be much easier, and once the barrier has been broken at several points, defending it at others becomes much more difficult.

For example, consider the consequences of demonstrating that the established media narrative is completely false on some major individual event. Once this result has been widely recognized, the credibility of the media on all other matters, even totally unrelated ones, would be somewhat attenuated. Ordinary people would naturally conclude that if the media had been so wrong for so long on one important point, it might also be wrong on others as well, and the powerful suspension of disbelief that provides the media its influence would become less powerful. Even those individuals who collectively form the corpus of the media might begin to entertain serious self-doubts regarding their previous certainties.

The crucial point is that such breakthroughs may be easiest to achieve in topics that seem merely of historical significance, and are totally removed from any practical present-day consequences.

**Reframe Vulnerable ﷺConspiracy Theories﷽ as Effective ﷺMedia Criticism﷽**

Over the last few decades, the political establishment and its media allies have created a powerful intellectual defense against major criticism by investing considerable resources in stigmatizing the notion of so-called ﷺconspiracy theories.﷽ This harsh pejorative term is applied to any important analysis of events that sharply deviates from the officially-endorsed narrative, and implicitly suggests that the proponent is a disreputable fanatic, suffering from delusions, paranoia, or other forms of mental illness. Such ideological attacks often effectively destroy his credibility, allowing his actual arguments to be ignored. A once-innocuous phrase has become politically ﷺweaponized.﷽

However, an effective means of circumventing this intellectual defense mechanism may be to adopt a meta-strategy of reframing such ﷺconspiracy theories﷽ as ﷺmedia criticism.﷽

Under the usual parameters of public debate, challenges to established orthodoxy are treated as ﷺextraordinary claims﷽ that must be justified by extraordinary evidence. This requirement may be unfair, but it constitutes the reality in many public exchanges, based upon the framework provided by the allegedly impartial media.

Since most of these controversies involve a wide range of complex issues and ambiguous or disputed evidence, it is often extremely difficult to conclusively establish any unorthodox theory, say to a confidence level of 95% or 98%. Therefore, the media verdict is almost invariably ﷺCase Not Proven﷽ and the challengers are judged defeated and discredited, even if they actually appear to have the preponderance of evidence on their side. And if they vocally contest the unfairness of their situation, that exact response is then subsequently cited by the media as further proof of their fanaticism or paranoia.

However, suppose that an entirely different strategy were adopted. Instead of attempting to make a case ﷺbeyond any reasonable doubt,﷽ proponents merely provide sufficient evidence and analysis

to suggest that there is a 30% chance or a 50% chance or a 70% chance that the unorthodox theory is true. The very fact that no claim of near certainty is being advanced provides a powerful defense against any plausible accusations of fanaticism or delusional thinking. But if the issue is of enormous importance and—as is usually the case—the unorthodox theory has been almost totally ignored by the media, despite apparently having at least a reasonable chance of being true, then the media may be effectively attacked and ridiculed for its laziness and incompetence. These charges are very difficult to refute and since no claim is being made that the unorthodox theory has necessarily been proven correct, merely that it might possibly be correct, any counter-accusations of conspiratorial tendencies would fall flat.

Indeed, the only means the media might have of effectively rebutting those charges would be to explore all the complex details of the issue (thereby helping to bring various controversial facts themselves to much wider attention) and then argue that there is only a negligible chance that the theory might be correct, perhaps 10% or less. Thus, the usual presumptive burden is completely reversed. And since most members of the media are unlikely to have ever paid much serious attention to the subject, their ignorant presentation may be quite weak and vulnerable to a knowledgeable deconstruction. Indeed, the most likely scenario is that the media will just continue to totally ignore the entire dispute, thereby reinforcing those plausible accusations of laziness and incompetence.

Individuals distressed by media failings on a controversial topic often accuse the media and its individual representatives of being biased, corrupted, or quietly under the control of powerful forces allied with the establishment position. These charges may sometimes be correct and sometimes not, but they are usually quite difficult to prove, except in the minds of existing true-believers, and they do carry the taint of "paranoia." On the other hand, claiming that media failings are due to venial sins such as laziness and incompetence are just as likely to be correct, and these charges are much less likely to risk a backlash.

Finally, once the media itself has become the primary target of the criticism, it automatically loses its status as a neutral outside arbitrator and no longer has as much credibility in proclaiming the winning side of the debate.

**The Advantage of Flooding Media Defense Zones**

Individuals who challenge the prevailing media narrative with unorthodox claims are often reluctant to raise too many such controversial claims simultaneously lest they be ridiculed as "crazy," with all their views summarily dismissed.

In most cases, this may be the correct strategy to pursue, but if handled properly, an exact opposite approach might sometimes be quite effective. So long as the overall presentation is framed as media criticism and no inordinate weight is attached to the validity of any of the particular claims being presented, attacking along a very broad front, perhaps including dozens of entirely independent items, may "flood the zone" of the media, saturating and overwhelming existing defenses. Or as suggested in a quote widely misattributed to Stalin, "Quantity has a quality all its own."

Consider the example of entertainer Bill Cosby. Over the years, one or two individual women had come forward claiming that he had drugged and raped them, and the charges had been largely ignored as unsubstantiated or implausible. However, over the last year or two, the dam suddenly burst and a total of nearly sixty separate women came forward, all making identical accusations, and although there seems little hard evidence in any of the particular cases, virtually every observer now concedes that the charges are likely to be true.

Suppose it is established that there is a reasonable likelihood that the media completely missed and ignored an important matter that should have been investigated and reported. The impact is not necessarily substantial, and many individuals stubbornly wedded to a belief in their establishment media narratives might even resist admitting the possibility that the media had seriously erred in that particular situation.

However, suppose instead that several dozen such separate examples could be established, each strongly suggesting a serious error or omission on the part of the media. At that point, ideological defenses would crumble and nearly everyone would quietly acknowledge that many, perhaps even most, of the accusations were probably true, producing an enormous credibility gap for the mainstream media. The credibility defenses of the media would have been saturated and overcome.

The key point is that all of the particular items should be presented as reasonable-likelihood cases, and indicative of media shortcomings

rather than being proven or necessarily as important issues in and of themselves. By remaining aloof and somewhat agnostic regarding any individual item, there is little risk of being tagged as fanatic or monomaniacal for raising a multitude of them.

**My American Pravda Series and *Unz Review* Webzine as Examples**

The political/media strategy outlined above was the central motivation behind my *American Pravda* articles and *Unz Review* webzine.

For example, in the original 2013 *American Pravda* article I raised over half a dozen enormous media lapses, all of them now universally acknowledged: Enron's collapse, the Iraq War WMDs, the Madoff Swindle, the Cold War spies, and various others. Having thereby set the stage by presenting this admitted pattern of major failure, demonstrating that a considerable suspension of disbelief was warranted, I then extended the discussion to three or four important additional examples, none of them yet acknowledged, but all of them perfectly plausible. Perhaps as a consequence, the article received reasonably good attention including by elements of the mainstream media itself, who are often willing to acknowledge the errors of their class so long as these are presented persuasively and in a responsible manner.

Following that piece, I intermittently produced additional elements in the series, some more comprehensive than others, and am now embarking upon a regular series.

The McCain/POW examples in the series perfectly illustrate the strategy I have suggested above. The Vietnam War ended over forty years ago, the POWs have probably all been dead for decades, and even John McCain is in the very twilight of his career. The practical significance of raising the scandal or providing evidence establishing its likelihood is virtually nil. But if it were to become widely recognized that our entire media successfully covered up such a massive scandal for so many years, the credibility of the media would have suffered a devastating blow. Several such blows and it would be left in ruins. Meanwhile, the powerful vested interests that once so vigorously maintained the official narrative in that area are long gone, and the orthodox case has few remaining defenders in the media, greatly increasing the likelihood of an eventual breakthrough and victory.

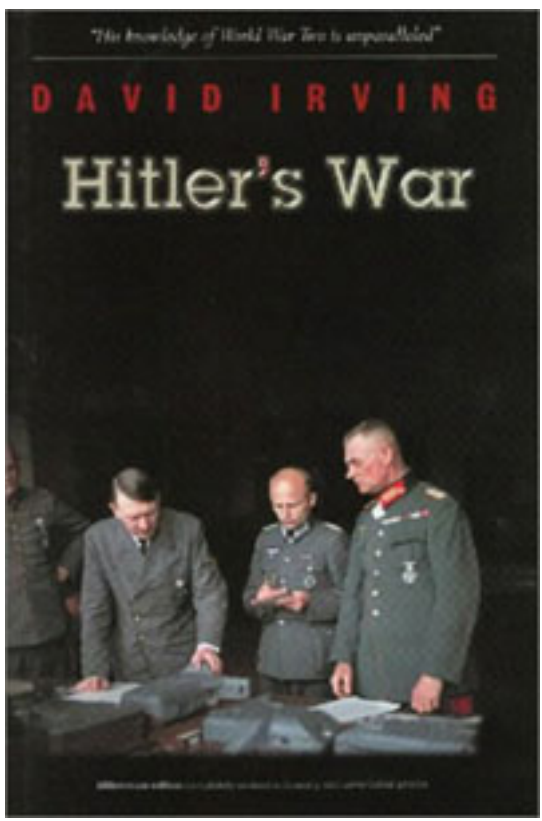
A similar strategy in broader form is applied by my *Unz Review* alternative media webzine, which hosts numerous different writers, columnists, and bloggers, all tending to sharply challenge the establishment media narrative along a wide variety of different axes and issues, some of them conflicting. By raising serious doubts about the omissions and errors of our mainstream media in so many different areas, the goal is to weaken the perceived credibility of the media, leading readers to consider the possibility that large elements of the conventional narrative may be entirely incorrect.

# The Remarkable Historiography of David Irving

June 4, 2018 • 1,700 Words

I'm very pleased to announce that our selection of HTML Books now contains works by renowned World War II historian David Irving, including his magisterial *Hitler's War*, named by famed military historian Sir John Keegan as one of the most crucial volumes for properly understanding that conflict.

- Hitler's War
  David Irving • 1991 • 397,000 Words



With many millions of his books in print, including a string of best-sellers translated into numerous languages, it's quite possible that the eighty-year-old Irving today ranks as the most internationally-successful British historian of the last one hundred years.  Although I

myself have merely read a couple of his shorter works, I found these absolutely outstanding, with Irving regularly deploying his remarkable command of the primary source documentary evidence to totally demolish my naive History 101 understanding of major historical events. It would hardly surprise me if the huge corpus of his writings eventually constitutes a central pillar upon which future historians seek to comprehend the catastrophically bloody middle years of our hugely destructive twentieth century even after most of our other chroniclers of that era are long forgotten.

Carefully reading a thousand-page reconstruction of the German side of the Second World War is obviously a daunting undertaking, and his remaining thirty-odd books would probably add at least another 10,000 pages to that Herculean task. But fortunately, Irving is also a riveting speaker, and several of his extended lectures of recent decades are conveniently available on YouTube, as given below. These effectively present many of his most remarkable revelations concerning the wartime policies of both Winston Churchill and Adolf Hitler, as well as sometimes recounting the challenging personal situation he himself faced. Watching these lectures may consume several hours, but that is still a trivial investment compared to the many weeks it would take to digest the underlying books themselves.

When confronted with astonishing claims that completely overturn an established historical narrative, considerable skepticism is warranted, and my own lack of specialized expertise in World War II history left me especially cautious. The documents Irving unearths seemingly portray a Winston Churchill so radically different from that of my naive understanding as to be almost unrecognizable, and this naturally raised the question of whether I could credit the accuracy of Irving's evidence and his interpretation. All his material is massively footnoted, referencing copious documents in numerous official archives, but how could I possibly muster the time or energy to verify them?

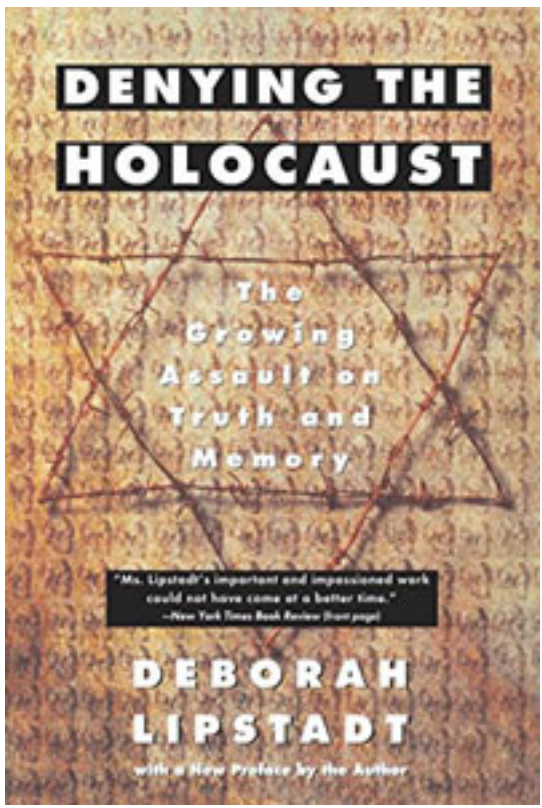
Rather ironically, an extremely unfortunate turn of events seems to have fully resolved that crucial question.

Irving is an individual of uncommonly strong scholarly integrity, and as such he is unable to see things in the record that do not exist, even if it were in his considerable interest to do so, nor to fabricate non-existent evidence. Therefore, his unwillingness to dissemble or pay lip-service to various widely-worshiped cultural totems eventually provoked an outpouring of vilification by a swarm of ideological fanatics drawn from a particular ethnic persuasion. This situation was rather similar to the troubles my old Harvard professor E.O. Wilson had experienced around that same time upon publication of his own masterwork *Sociobiology: The New Synthesis*, the book that helped

launch the field of modern human evolutionary psychobiology.

These zealous ethnic-activists began a coordinated campaign to pressure Irving's prestigious publishers into dropping his books, while also disrupting his frequent international speaking tours and even lobbying countries to bar him from entry. They maintained a drumbeat of media vilification, continually blackening his name and his research skills, even going so far as to denounce him as a "Nazi" and a "Hitler-lover," just as had similarly been done in the case of Prof. Wilson.

During the 1980s and 1990s, these determined efforts, sometimes backed by considerable physical violence, increasingly bore fruit, and Irving's career was severely impacted. He had once been feted by the world's leading publishing houses and his books serialized and reviewed in Britain's most august newspapers; now he gradually became a marginalized figure, almost a pariah, with enormous damage to his sources of income.



DENYING THE HOLOCAUST
The Growing Assault on Truth and Memory
"Ms. Lipstadt's important and impassioned work could not have come at a better time."
DEBORAH LIPSTADT
with a New Preface by the Author

In 1993, Deborah Lipstadt, a rather ignorant and fanatic professor of Theology and Holocaust Studies (or perhaps "Holocaust Theology")

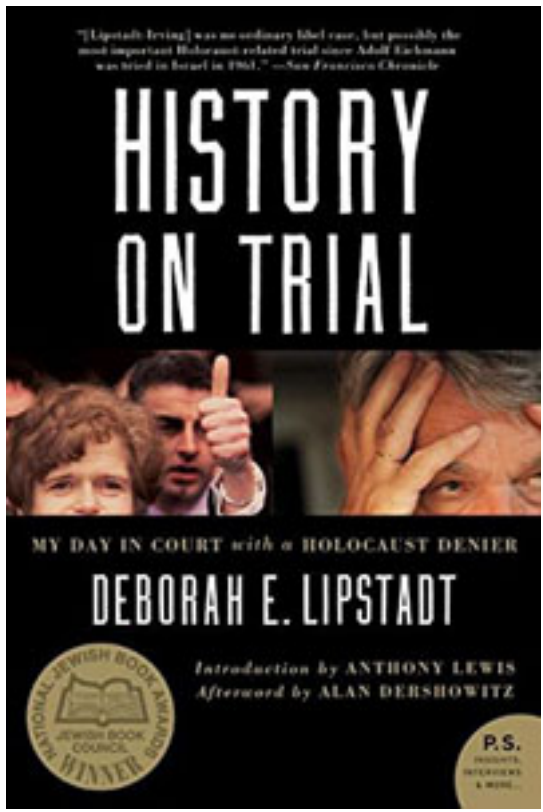
ferociously attacked him in her book as being a "Holocaust Denier," leading Irving's timorous publisher to suddenly cancel the contract for his major new historical volume. This development eventually sparked a rancorous lawsuit in 1998, which resulted in a celebrated 2000 libel trial held in British Court.

That legal battle was certainly a David-and-Goliath affair, with wealthy Jewish movie producers and corporate executives providing a huge war-chest of $13 million to Lipstadt's side, allowing her to fund a veritable army of 40 researchers and legal experts, captained by one of Britain's most successful Jewish divorce lawyers. By contrast, Irving, being an impecunious historian, was forced to defend himself without benefit of legal counsel.

In real life unlike in fable, the Goliaths of this world are almost invariably triumphant, and this case was no exception, with Irving being driven into personal bankruptcy, resulting in the loss of his fine central London home. But seen from the longer perspective of history, I think the victory of his tormenters was a remarkably Pyrrhic one.

Although the target of their unleashed hatred was Irving's alleged "Holocaust denial," as near as I can tell, that particular topic was almost entirely absent from all of Irving's dozens of books, and exactly

that very silence was what had provoked their spittle-flecked outrage. Therefore, lacking such a clear target, their lavishly-funded corps of researchers and fact-checkers instead spent a year or more apparently performing a line-by-line and footnote-by-footnote review of everything Irving had ever published, seeking to locate every single historical error that could possibly cast him in a bad professional light. With almost limitless money and manpower, they even utilized the process of legal discovery to subpoena and read the thousands of pages in his bound personal diaries and correspondence, thereby hoping to find some evidence of his wicked thoughts. *Denial*, a 2016 Hollywood film co-written by Lipstadt, may provide a reasonable outline of the sequence of events as seen from her perspective.



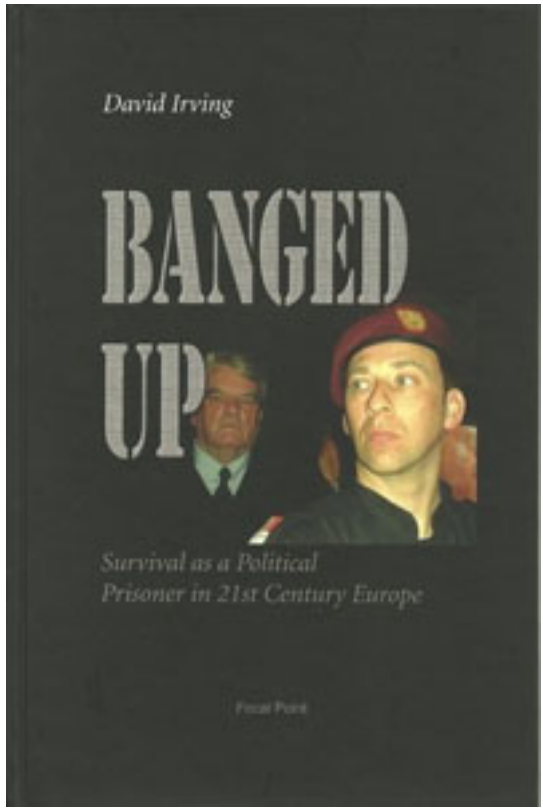
Yet despite such massive financial and human resources, they apparently came up almost entirely empty, at least if Lipstadt's triumphalist 2005 book *History on Trial* may be credited. Across four decades of research and writing, which had produced numerous controversial historical claims of the most astonishing nature, they only managed to find a couple of dozen rather minor alleged errors of fact or interpretation, most of these ambiguous or disputed. And the

worst they discovered after reading every page of the many linear meters of Irving's personal diaries was that he had once composed a short "racially insensitive" ditty for his infant daughter, a trivial item which they naturally then trumpeted as proof that he was a "racist." Thus, they seemingly admitted that Irving's enormous corpus of historical texts was perhaps 99.9% accurate.

I think this silence of "the dog that didn't bark" echoes with thunderclap volume. I'm not aware of any other academic scholar in the entire history of the world who has had all his decades of lifetime work subjected to such painstakingly exhaustive hostile scrutiny. And since Irving apparently passed that test with such flying colors, I think we can regard almost every astonishing claim in all of his books—as recapitulated in his videos—as absolutely accurate.

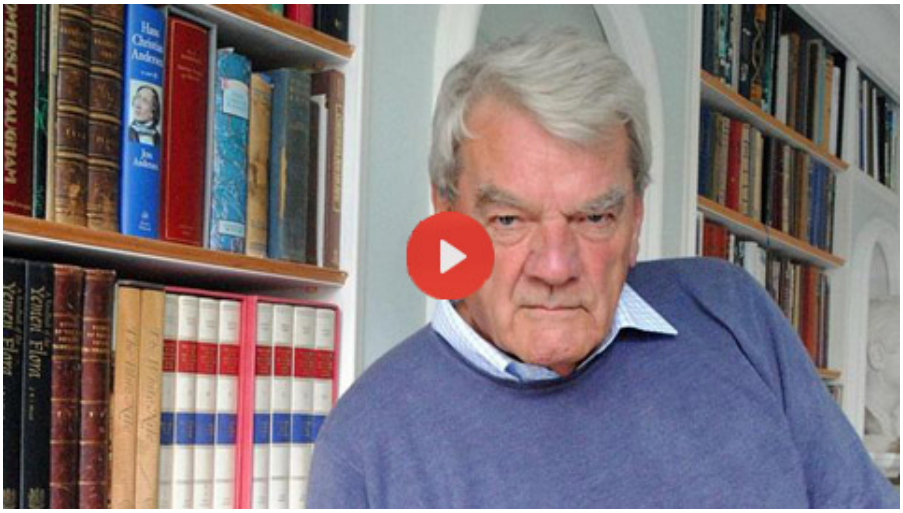
Aside from this important historical conclusion, I believe that the most recent coda to Irving's tribulations tells us quite a lot about the true nature of "Western liberal democracy" so lavishly celebrated by our media pundits, and endlessly contrasted with the "totalitarian" or "authoritarian" characteristics of its ideological rivals, past and present.

In 2005, Irving took a quick visit to Austria, having been invited to speak before a group of Viennese university students. Shortly after his arrival, he was arrested at gunpoint by the local Political Police on charges connected with some historical remarks he had made 16 years earlier on a previous visit to that country, although those had apparently been considered innocuous at the time. Initially, his arrest was kept secret and he was held completely incommunicado; for his family back in Britain, he seemed to have disappeared off the face of the earth, and they feared him dead. More than six weeks were to pass before he was allowed to communicate with either his wife or a lawyer, though he managed to provide word of his situation earlier through an intermediary.



And at the age of 67 he was eventually brought to trial in a foreign courtroom under very difficult circumstances and given a three-year prison sentence. An interview he gave to the BBC about his legal predicament resulted in possible additional charges, potentially carrying a further twenty-year sentence, which probably would have ensured that he died behind bars. Only the extremely good fortune of a successful appeal, partly on technical grounds, allowed him to depart the prison grounds after spending more than 400 days under incarceration, almost entirely in solitary confinement, and he escaped back to Britain.

His sudden, unexpected disappearance had inflicted huge financial hardships upon his family, and they lost their home, with most of his personal possessions being sold or destroyed, including the enormous historical archives he had spent a lifetime accumulating. He later recounted this gripping story in *Banged Up*, a slim book published in 2008, as well as in a video interview available on YouTube.



Perhaps I am demonstrating my ignorance, but I am not aware of any similar case of a leading international scholar who suffered such a dire fate for quietly stating his historical opinions, even during in darkest days of Stalinist Russia or any of the other totalitarian regimes of the twentieth century.  Although this astonishing situation taking place in a West European democracy of the "Free World" did receive considerable media exposure within Europe, coverage in our own country was so minimal that I doubt that today even one well-educated American in twenty is even aware it ever happened.

One reason that most of us still believe that the West remains a free society is that Our American Pravda works so hard to conceal the important exceptions.

  David Irving • 1991 • 11,000 Words

# When Stalin Almost Conquered Europe

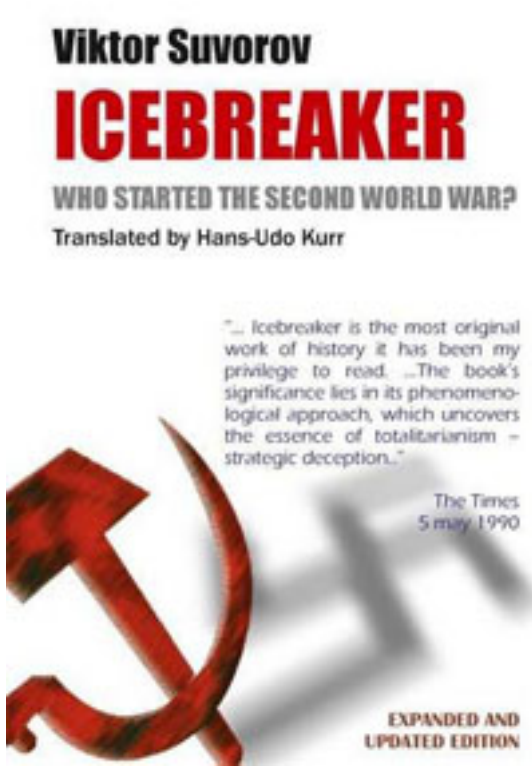
June 4, 2018 • 4,200 Words

For many years I maintained far too many magazine subscriptions, more periodicals than I could possibly read or even skim, so most weeks they went straight into storage, with scarcely more than a glance at the cover. But every now and then, I might casually browse one of them, curious about what I had usually been missing.

Thus, in the summer of 2010, I happened to leaf through an issue of *Chronicles*, the small-circulation flagship organ of the marginalized paleoconservative movement, and soon began reading a blandly-titled book review. But the piece so astonished me that it immediately justified all the many years of subscription payments I had sent to that magazine.

The reviewer was Andrei Navrozov, a Soviet emigre long resident in Britain, and he opened by quoting a passage from a previous 1990 book review, published almost exactly twenty years before:

> [Suvorov] is arguing with every book, every article, every film, every NATO directive, every Downing Street assumption, every Pentagon clerk, every academic, every Communist and anti-Communist, every neoconservative intellectual, every Soviet song, poem, novel and piece of music ever heard, written, made, sung, issued, produced, or born during the last 50 years. For this reason, *Icebreaker* is the most original work of history it has been my privilege to read.



Viktor Suvorov
ICEBREAKER
WHO STARTED THE SECOND WORLD WAR?
Translated by Hans-Udo Kurr
"... Icebreaker is the most original work of history it has been my privilege to read. ...The book's significance lies in its phenomenological approach, which uncovers the essence of totalitarianism – strategic deception.."
The Times
5 may 1990
EXPANDED AND
UPDATED EDITION

He himself had written that earlier book review, which ran in the prestigious *Times Literary Supplement* following the original English publication of *Icebreaker*, and his description was not overblown. The work sought to overturn the settled history of World War II.

*Icebreaker*'s author, writing under the pen-name Viktor Suvorov, was a veteran Soviet military intelligence officer who had defected to the West in 1978 and subsequently published a number of well-regarded books on the Soviet military and intelligence services. But here he advanced a far more radical thesis.

The 'Suvorov Hypothesis' claimed that during the summer of 1941 Stalin was on the very verge of mounting a massive invasion and conquest of Europe, while Hitler's sudden attack on June 22nd of that year was intended to forestall that looming blow. Moreover, the author also argued that Stalin's planned attack constituted merely the final act in a much longer geopolitical strategy that he had been developing since at least the early 1930s.

Following the Bolshevik Revolution, the new Soviet regime had been viewed with extreme suspicion and hostility by other European countries, most of which also regarded their own domestic Communist

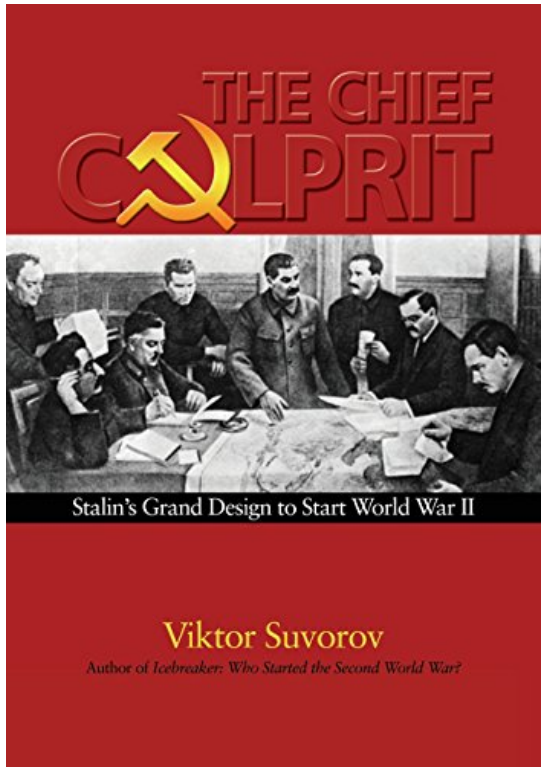
Parties as likely fifth columns. So to fulfill Lenin's dream and carry the revolution to Germany and the rest of Europe, Stalin somehow needed to split the Europeans, and break their common line of resistance. He allegedly viewed Hitler's rise as exactly such a potential "icebreaker," an opportunity to unleash another bloody European war and exhaust all sides, while the Soviet Union remained aloof and bided its strength, waiting for the right moment to sweep in and conquer the entire continent.

To this end, Stalin had directed his powerful German Communist Party to take political actions ensuring that Hitler came to power and then later lured the German dictator into signing the Molotov-Ribbentrop Pact to divide Poland. This led Britain and France to declare war on Germany, while also eliminating the Polish buffer state, thereby placing Soviet armies directly on the German border. And from the very moment he signed that long-term peace agreement with Hitler, he abandoned all his defensive preparations, and instead embarked upon an enormous military build-up of the purely offensive forces he intended to use for European conquest. Thus according to Suvorov, Stalin ranks as "the chief culprit" behind the outbreak of World War II in Europe, and the updated English edition of his book bears that exact title.

To my great surprise I discovered that Suvorov's remarkable theories had gained enormous worldwide prominence since 1990, and had been widely discussed almost everywhere except in America and the other English-speaking countries. As Navrozov explained:

> [The English edition of the] book sold 800 copies.
>
> Some months later, a German edition of the book, under the *title Der Eisbrecher: Hitler in Stalins Kaulkul*, was published in Germany by a smallish house, Klett-Cotta, to timid and gingerly reviews. It sold 8,000 copies. In 1992, Suvorov's manuscript was delivered to a maverick publisher in Moscow, and at last the book saw the light of day in the original Russian, quickly selling out its first print run of 100,000 copies. In the years that followed, over five million copies have been sold, making Suvorov the most-read military historian in history.
>
> And yet, in the nearly 20 years that have elapsed between *Icebreaker*'s launch in England and the present publication of *The Chief Culprit*, no British, American, Canadian, or Australian publisher saw fit to exploit potentially global interest in the drifting *Icebreaker*—or to so much as touch Suvorov with a barge

pole—despite the fact that the almost unobtainable $20 copies of the long-out-of print Hamish Hamilton edition have been changing hands on the internet for upward of $500.



THE CHIEF
CULPRIT
Stalin's Grand Design to Start World War II
Viktor Suvorov
Author of Icebreaker: Who Started the Second World War?

Since 1990, Suvorov's works have been translated into at least 18 languages and an international storm of scholarly controversy has swirled around the Suvorov Hypothesis in Russia, Germany, Israel, and elsewhere. Numerous other authors have published books in support or more often strong opposition, and even international academic conferences have been held to debate the theory. But our own English-language media has almost entirely blacklisted and ignored this ongoing international debate, to such an extent that the name of the most widely-read military historian who ever lived had remained totally unknown to me.

Finally in 2008, the prestigious Naval Academy Press of Annapolis decided to break this 18 year intellectual embargo and published an updated English edition of Suvorov's work. But once again, our media outlets almost entirely averted their eyes, and only a single review appeared in an obscure ideological publication, where I chanced to encounter it. This conclusively demonstrates that throughout most of the twentieth century a united front of English-language publishers

and media organs could easily maintain a boycott of any important topic, ensuring that almost no one in America or the rest of the Anglosphere would ever hear of it. Only with the recent rise of the Internet has this disheartening situation begun to change.

Determining Stalin's true motives and the basis of his foreign policy during the 1930s is hardly easy, and his statements and actions are subject to multiple interpretations. Therefore, the theory that the dictator spent all those years deftly preparing the outbreak of World War II appears quite speculative to me. But the other central claim of the Suvorov Hypothesis—that the Soviets were themselves on the verge of attacking when the Germans struck—is an extremely factual question, which can be evaluated based on hard evidence. I find the case quite compelling, at least if the facts and details that Suvorov cites in support are not totally spurious, which seems unlikely with the Naval Academy Press as his publisher.

The Eastern Front was the decisive theater of World War II, involving military forces vastly larger than those deployed in the West or the Pacific, and the standard narrative always emphasizes the ineptitude and weakness of the Soviets. On June 22, 1941, Hitler launched Operation Barbarossa, a sudden, massive surprise attack on the USSR, which caught the Red Army completely unaware. Stalin has been regularly ridiculed for his total lack of preparedness, with Hitler often described as the only man the paranoid dictator had ever fully trusted. Although the defending Soviet forces were enormous in size, they were poorly led, with their officer corps still not recovered from the crippling purges of the late 1930s, and their obsolete equipment and poor tactics were absolutely no match for the modern panzer divisions of Germany's hitherto undefeated *Wehrmacht*. The Russians initially suffered gigantic losses, and only the onset of winter and the vast spaces of their territory saved them from a quick defeat. After this, the war seesawed back-and-forth for four more years, until superior numbers and improved tactics finally carried the Soviets to the streets of a destroyed Berlin in 1945.

Such is the traditional understanding of the titanic Russo-German struggle that we see endlessly echoed in every newspaper, book, television documentary, and film around us. But even a cursory examination of the initial situation has always revealed strange anomalies.

Many years ago, while in Junior High, I became an avid war-gamer

with a strong interest in military history, and the Eastern Front of World War II was certainly a very popular topic. But every reconstruction of Operation Barbarossa always noted that the Germans owed much of their great initial success to the very odd deployment of the huge Soviet forces, which were all massed along the border in vulnerable formations almost as if preparing for an attack, and some writers casually suggested that this might have indeed been the case. But the sheer volume of supporting evidence accumulated by Suvorov goes far beyond this sort of idle speculation, and he produces a historical picture radically different than what our standard accounts have always implied.

First, although there has been a widespread belief in the superiority of Germany's military technology, its tanks and its planes, this is almost entirely mythological. In actual fact, Soviet tanks were far superior in main armament, armor, and maneuverability to their German counterparts, so much so that the overwhelming majority of panzers were almost obsolescent by comparison. And the Soviet superiority in numbers was even more extreme, with Stalin deploying many times more tanks than the combined total of those held by Germany and every other nation in the world: 27,000 against just 4,000 in Hitler's forces. Even during peacetime, a single Soviet factory in Kharkov produced more tanks in every six month period than the entire Third Reich had built prior to 1940. The Soviets held a similar superiority, though somewhat less extreme, in their ground-attack bombers. The totally closed nature of the USSR meant that such vast military forces remained entirely hidden from outside observers.

There is also little evidence that the quality of Soviet officers or military doctrine fell short. Indeed, we often forget that history's first successful example of a "blitzkrieg" in modern warfare was the crushing August 1939 defeat that Stalin inflicted upon the Japanese 6th Army in Outer Mongolia, relying upon a massive surprise attack of tanks, bombers, and mobile infantry. And Stalin apparently thought so highly of many of his top military strategists in 1941, that despite his huge initial losses, many of them remained in command and were eventually promoted to the highest ranks of the Soviet military establishment by the end of the war.

Certainly, many aspects of the Soviet military machine were primitive, but exactly the same was true of their Nazi opponents. Perhaps the most surprising detail about the technology of the invading Wehrmacht in 1941 was that its transportation system was still almost entirely pre-modern, relying upon wagons and carts drawn by 750,000 horses to maintain the vital flow of ammunition and

replacements to its advancing armies.

Meanwhile, major categories of Soviet weapons systems seem almost impossible to explain except as important elements of Stalin's offensive plans. Although the bulk of the Soviet armored forces were medium tanks like the T-28 and T-34, generally far superior to their German counterparts, the USSR had also pioneered the development of several lines of highly specialized tanks, most of which had no counterpart elsewhere in the world.

(*) The Soviets had produced a remarkable line of light BT tanks, easily able to shed their tracks and continue on wheels, achieving a top speed of 60 miles per hour, two or three times faster than any other comparable armored vehicle, and ideally suited to exploitation drives deep into enemy territory. However, such wheeled operation was only effective on paved highways, of which Soviet territory had none, hence were ideally suited for travel on Germany's large network of *autobahns*. In 1941 Stalin deployed almost 6,500 of these *autobahn*-oriented tanks, more than the rest of the world's tanks combined.

(*) For centuries, Continental conquerors from Napoleon to Hitler had been stymied by the barrier of the English Channel, but Stalin was far better prepared. Although the vast Soviet Union was entirely a land-power, he pioneered the world's only series of fully amphibious light tanks, able to successfully cross large rivers, lakes, and even that notoriously wide moat last successfully traversed by William the Conqueror in 1066. By 1941, the Soviets deployed 4,000 of these amphibious tanks, far more than the 3,350 German tanks of all types used in the attack. But being useless in defense, they were all ordered abandoned or destroyed.

(*) The Soviets also fielded many thousands of heavy tanks, intended to engage and defeat enemy armor, while the Germans had none at all. In direct combat, a Soviet KV-1 or KV-2 could easily destroy four or five of the best German tanks, while remaining almost invulnerable to enemy shells. Suvorov recounts the example of a KV which took 43 direct hits before finally becoming incapacitated, surrounded by the hulks of the ten German tanks it had first managed to destroy.

Other evidence of the scale and intent of Stalin's armies in the summer of 1941 are equally telling:

(*) During the early years of World War II, the Germans effectively utilized paratroops and air-mobile forces to seize key enemy targets far behind the front lines during a major offensive, and this was an

important component of their victories against France in 1940 and Greece in 1941. Such units are necessarily lightly armed and no match for regular infantry in a defensive battle; hence their only role is an offensive one. Germany entered the war with 4,000 paratroops, a far larger force than anything found in Britain, France, America, Italy, or Japan. However, the Soviets had at least 1,000,000 trained paratroopers, and Suvorov believes that the true total was actually closer to 2,000,000.

(*) Sometimes the production decisions of major weapon systems provide strong hints of the broader strategy behind their development. The most widely produced military aircraft in history was the heavily armored IL-2, a powerful Soviet ground-attack bomber that was originally designed as a two-man system, with the rear gunner able to effectively defend the plane against enemy fighters during its missions. However, Stalin personally ordered the design changed to eliminate the second man and defensive armament, which left the bomber extremely vulnerable to enemy aircraft once the war broke out. Stalin and his war-planners had seemingly banked on possessing near-total air supremacy during the entire course of any conflict, an assumption plausible only if the German *luftwaffe* were destroyed on the ground by a surprise attack on the very first day.

(*) There is considerable evidence that in the weeks prior to the German surprise attack, Stalin had ordered the release of many hundreds of thousands of Gulag prisoners, who were issued basic weapons and organized into NKVD-led divisions and corps, constituting a substantial part of the Second Strategic Echelon located hundreds of miles from the German border. These units may have been intended to serve as occupation troops, allowing the much more powerful front-line forces to press onward and complete the conquests of France, Italy, the Balkans, and Spain. Otherwise, I can find no other plausible explanation for Stalin's action.

(*) The planned invasion and occupation of a large country whose population speaks a different language requires considerable logistical preparation. As an example, prior to their attack the notoriously methodical Germans printed and distributed to their troops large numbers of basic German-Russian phrasebooks, allowing effective communication with the local Slavic villagers and townsmen. Ironically enough, at around the same time, the USSR seems to have produced very similar Russian-German phrasebooks, allowing conquering Soviet troops to easily make themselves understood to German civilians. Many millions of these phrasebooks had been distributed to Soviet forces on the German border during the early

months of 1941.

Suvorov's reconstruction of the weeks directly preceding the outbreak of combat is a fascinating one, emphasizing the mirror-image actions taken by both the Soviet and German armies. Each side moved its best striking units, airfields, and ammunition dumps close to the border, ideal for an attack but very vulnerable in defense. Each side carefully deactivated any residual minefields and ripped out any barbed wire obstacles, lest these hinder the forthcoming attack. Each side did its best to camouflage their preparations, talking loudly about peace while preparing for imminent war. The Soviet deployment had begun much earlier, but since their forces were so much larger and had far greater distances to cross, they were not yet quite ready for their attack when the Germans struck, and thereby shattered Stalin's planned conquest of Europe.

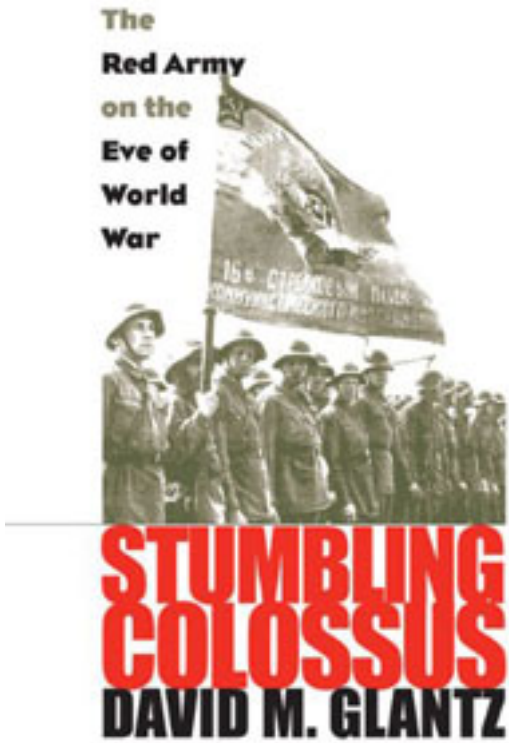
All of the above examples of Soviet weapons systems and strategic decisions seem very difficult to explain under the conventional defensive narrative, but make perfect sense if Stalin's orientation from 1939 onward had always been an offensive one, and he had decided that summer 1941 was the time to strike and enlarge his Soviet Union to include all the European states, just as Lenin had originally intended. And Suvorov provides many dozens of additional examples, building brick by brick a very compelling case for this theory.

The book is not overly long, running perhaps 150,000 words, and $20 plus a few mouse clicks on Amazon will provide you a copy to read and judge for yourself. But for those who desire a simple summary, Suvorov's 2009 lecture at the Eurasia Forum of the Annapolis Naval Academy is conveniently available on YouTube, though slightly hindered by his weak English:

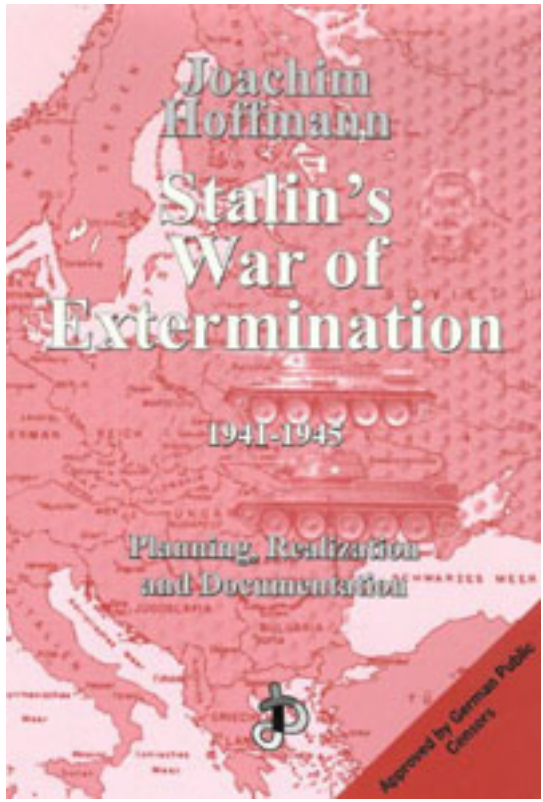
And also his C-SPAN Book TV lectures at the Woodrow Wilson Center:

Controversial theories, even if backed by seemingly strong evidence, can hardly be properly evaluated until they have been weighed against the counter-arguments of their strongest critics, and this should certainly be the case with the Suvorov Hypothesis. But although the last three decades have seen the development of a large secondary literature, much of it sharply critical, nearly all this international debate has taken place in Russian, German, or Hebrew,

languages that I do not read.



There are some exceptions. Several years ago, I came across a website debate on the topic, and one strong critic claimed that Suvorov's theories had been totally debunked by American military historian David M. Glantz in *Stumbling Colossus*, published in 1998. But when I ordered and read the book I was sorely disappointed. Although purporting to refute Suvorov, the author seemed to ignore almost all of his central arguments, and merely provided a rather dull and pedantic recapitulation of the standard narrative I had previously seen hundreds of times, laced with a few rhetorical excesses denouncing the unique vileness of the Nazi regime. Most ironically, Glantz emphasizes that although Suvorov's analysis of the titanic Russo-German military struggle had gained great attention and considerable support among both Russian and German scholars, it had been generally ignored in the Anglo-American world, and he almost seems to imply that it could probably be disregarded for that reason. Perhaps this attitude reflected the cultural arrogance of many American intellectual elites during Russia's disastrous Yeltsin Era of the late 1990s.



A far superior book, generally supportive of Suvorov's framework, was *Stalin's War of Annihilation*, by prize-winning German military historian Joachim Hoffmann, originally commissioned by the German Armed Forces and published in 1995 with an English revised edition appearing in 2001. The cover carries a notice that the text was cleared by German government censors, and the author's introduction recounts the repeated threats of prosecution he endured from elected officials and the other legal obstacles he faced, while elsewhere he directly addresses himself to the unseen government authorities whom he knows are reading over his shoulder. When stepping too far outside the bounds of accepted history carries the serious risk that a book's entire print-run will be burned and the author imprisoned, a reader must necessarily be cautious at evaluating the text since important sections have been skewed or preemptively excised in the interests of self-preservation. Scholarly debates on historical issues become difficult when one side faces incarceration if their arguments are too bold.

Can we say whether Suvorov is right? Since our information

gatekeepers of the English-language world have spent the last three decades closing their eyes and pretending that the Suvorov Hypothesis does not exist, the near-complete absence of any substantial reviews or critiques makes it very difficult for me to come to any definite conclusion. But based on the available evidence, I believe it is far more likely than not that Suvorov's theories are at least substantially correct. And if so, our current understanding of World War II—the central formative event of our modern world—is entirely transformed.

Suvorov notes that treaties or pacts are traditionally named for the city in which they are signed—the Warsaw Pact, the Baghdad Pact, the Munich Agreement—and thus the so-called "Molotov-Ribbentrop Pact" signed in August 23, 1939 by which Hitler and Stalin agreed to the division of Poland should more properly be called "the Moscow Pact." As a direct result of that agreement, Stalin gained half of Poland, the Baltic States, and various other advantages, including a direct border with Germany. Meanwhile, Hitler was punished by declarations of war from France and Britain, along with worldwide condemnation as a military aggressor. Although Germany and Russia both invaded Poland, the latter managed to avoid being dragged into any war with Poland's erstwhile allies. Thus, the primary beneficiary of the Moscow Pact was clearly Moscow.

Given the long years of trench warfare on the Western front during the First World War, almost all outside observers expected the new round of the conflict to follow a very similar static pattern, gradually exhausting all sides, and the world has shocked when Germany's innovative tactics allowed it to achieve a lightening defeat of the allied armies in France during 1940. At that point, Hitler regarded the war as essentially over, and was confident that the extremely generous peace terms he immediately offered the British would soon lead to a final settlement. As a consequence, he returned Germany to a regular peacetime economy, choosing butter over guns in order to maintain his high domestic popularity

Stalin, however, was under no such political constraints, and from the moment he had signed his long-term peace agreement with Hitler in 1939 and divided Poland, he ramped up his total-war economy to an even higher notch. Embarking upon an unprecedented military buildup, he focused his production almost entirely upon purely offensive weapons systems, while even discontinuing those armaments better suited for defense and dismantling his previous lines of fortifications. By 1941, his production cycle was complete, and he made his plans accordingly.

And so, just as in our traditional narrative, we see that in the weeks and months leading up to Barbarossa, the most powerful offensive military force in the history of the world was quietly assembled in secret along the German-Russian border, preparing for the order that would unleash its surprise attack. The enemy's unprepared airforce was to be destroyed on the ground in the first days of the battle, and enormous tank columns would begin deep penetration thrusts, surrounding and trapping the opposing forces, achieving a classic *blitzkrieg* victory, and ensuring the rapid occupation of vast territories. But the forces preparing this unprecedented war of conquest were Stalin's, and his military juggernaut would surely have seized all of Europe, probably soon followed by the remainder of the Eurasian landmass.

Then at almost the last moment, Hitler suddenly realized the strategic trap into which he had fallen, and ordered his heavily outnumbered and outgunned troops into a desperate surprise attack of their own on the assembling Soviets, fortuitously catching them at the very point at which their own final preparations for sudden attack had left them most vulnerable, and thereby snatching a major initial victory from the jaws of certain defeat. Huge stockpiles of Soviet ammunition and weaponry had been positioned close to the border to supply the army of invasion into Germany, and these quickly fell into German hands, providing an important addition to their own woefully inadequate resources.

The enormous and fully-militarized productive capacity of the Soviet state, supplemented by the contributions of Britain and America, did eventually turn the tide of battle and lead to a Soviet victory, but Stalin ended up with only half of Europe rather than its entirety. Suvorov argues that the fatal weakness of the Soviet system was its total inability to compete with non-Sovietized states in the peacetime production of civilian goods, and because such other states had still survived after the war, the Soviet Union was doomed to eventual collapse.

Navrozov, the *Chronicles* reviewer, is a Russian Slav and therefore hardly favorable to the German dictator. But he closes his review with a remarkable statement:

> Therefore, if any of us is free to write, publish, and read this today, it follows that in some not inconsequential part our gratitude for this must go to Hitler. And if someone wants to arrest me for saying what I have just said, I make no secret of where I live.

# Our Great Purge of the 1940s

June 11, 2018 • 5,500 Words

Although I've soured on him in recent years, for the first decade and more of Paul Krugman's tenure at the *New York Times* I regarded him as about the only national columnist worth reading. Certainly many others felt the same way, and Krugman regularly ranked among the most influential liberal voices in the country, gaining that position by his uniquely strong stance against the Iraq War plans of President George W. Bush, while his prestige was capped by winning 2007 Nobel Prize in Economics.

But few probably remember that just a couple of years into his column there was a concerted effort to pressure the *Times* into firing him, a campaign spearheaded by blogger Andrew Sullivan, then an ardent Bush supporter. Given the steady drum-beat of harsh accusations and the climate of that period, I had feared that it would succeed. Now suppose that he had been purged from all media access in 2002, and also that Bush's Iraq adventure had turned out to be a considerable success, rather than the utter disaster it actually became. A couple of decades hence, would anyone remember Krugman, except in some minor historical footnote recounting the misguided naysayers whom our heroic President ﷺ had fortunately overcome?

Perhaps by 2040 any mention of Krugman's name would either draw a blank stare or evoke a vague sense that he had been some sort of disreputable radical activist, perhaps with pro-Islamicist leanings and even suspected by some of having had a hand in the 9/11 attacks. History has traditionally been written by the political winners, and this was especially true in the days before the growth of the Internet weakened the total monopoly of our establishment media.

These were some of the thoughts that gradually crossed my mind during the middle part of the 2000s as I discovered some remarkable anomalies while creating my content-archiving website, a system intended to provide convenient access to millions of articles from America's most influential publications of the last 150 years. Since I had never really studied American history, my views were generally quite conventional ones, formed from a mixture of the History 101 classes I had taken and what I had casually absorbed over the years from all the newspapers and magazines that I read.

Many of the most frequent names I encountered in America's prestigious and respectable periodicals of the past were reasonably well known to me, but others were not. It was a strange feeling to see the overwhelming presence of writers who were either completely obscure or else whom I had always regarded as denizens of the disreputable radical fringe, distributing their angry mimeographed tracts on street corners, rather than respected figures regularly gracing the pages of *The New Republic*, *Foreign Affairs*, and *The Nation*. My comprehension of the past was obviously mistaken.

Take the case of John T. Flynn, probably unknown today to all but one American in a hundred, if even that. Given my much broader ideological explorations, I had sometimes seen him hailed as an important figure in the Old Right, a founder of the America First Committee, and someone friendly to both Sen. Joseph McCarthy and the John Birch Society, though falsely smeared by his opponents as a proto-fascist or Nazi-sympathizer. This sort of description seemed to form a consistent if somewhat disputed picture in my mind.

So imagine my surprise at discovering that throughout the 1930s he had been one of the single most influential *liberal* voices in American society, a writer on economics and politics whose status may have roughly approximated that of Paul Krugman, though with a strong muck-raking tinge. His weekly column in *The New Republic* allowed him to serve as a lodestar for America's progressive elites, while his regular appearances in *Colliers*, an illustrated mass circulation weekly reaching many millions of Americans, provided him a platform comparable to that of an major television personality in the later heyday of network TV.

To some extent, Flynn's prominence may be objectively quantified. A few years ago, I happened to mention his name to a well-read and committed liberal born in the 1930s, and she unsurprisingly drew a complete blank, but wondered if he might have been a little like Walter Lippmann, the very famous columnist of that era. When I checked, I saw that across the hundreds of periodicals in my archiving system, there were just 23 articles by Lippmann from the 1930s but fully 489 by Flynn.

Much of Flynn's early prominence came from his important role in the 1932 Senate Pecora Commission, which had pilloried the grandees of Wall Street for the 1929 stock market collapse, and whose recommendations ultimately led to the creation of the Securities and Exchange Commission and other important financial reforms. Following an impressive career in newspaper journalism, he had

moved over to *The New Republic* as a weekly columnist in 1930. Although initially sympathetic to Franklin Roosevelt's goals, he soon became skeptical about the effectiveness of his methods, noting the sluggish expansion of public works projects and wondering whether the vaunted NRA was actually more beneficial to big business owners than to ordinary workers.

As the years went by, his criticism of Roosevelt Administration turned harsher on economic and eventually foreign policy grounds, and he incurred its enormous hostility as a consequence. Roosevelt began sending personal letters to leading editors demanding that Flynn be barred from any prominent American print outlet, and perhaps as a consequence he lost his longstanding *New Republic* column immediately following FDR's 1940 reelection, and his name disappeared from mainstream periodicals. However, he still authored a number of best-selling books over the years sharply attacking Roosevelt, and after the war his byline occasionally surfaced in much less mainstream and influential publications. A decade ago the libertarian Ludwig von Mises Institute republished a couple of Flynn's books, and a lengthy introduction by Prof. Ralph Raico sketched in some of this background.

Supporters of my local Palo Alto library hold a monthly book sale at which donated items are sold for a pittance, and I usually drop by to browse the shelves out of curiosity for what I might find. A few years ago, I happened to notice one of Flynn's FDR books, published in 1948, and bought it for a quarter. The material presented on the yellowing pages of *The Roosevelt Myth* were eye-opening to me.

Anyone can write a book saying anything, and if some obscure right-winger leveled astonishing charges against a liberal president, I might not pay much attention. But if Paul Krugman had spent years expressing growing doubts about Barack Obama's policies and effectiveness, then finally turned against him and published a national best-seller denouncing his administration, surely those opinions would carry much more weight. And so it was with Flynn's accusations against Roosevelt.

I am no expert on the New Deal Era, but Flynn's work seemed soberly and persuasively written, although in a journalistic muck-raking style, and he makes all sorts of claims I had never previously encountered. My software system provides cross-referenced book reviews and I read a dozen of these. A few from around the time of the book's

publication were extremely critical, denouncing the contents as total nonsense written by a notoriously crazed ﷺRoosevelt-hater.ﷺ But no specific rebuttals were provided and the general tone was much like that of the numerous *Wall Street Journal* op-eds from the mid-2000s which issued blanket denunciations of books written by ﷺcrazed Bush-haters.ﷺ  Indeed, the sum-total of the one 1949 review consisted of the single sentence ﷺ*Unadulterated venom from a professional F.D.R.-hater.*ﷺ  However, other, more recent reviews, admittedly drawn from the libertarian camp, were overwhelmingly favorable.  Having no great expertise, I cannot effectively judge.

But Flynn's claims were extremely precise, detailed, and specific, including numerous names, dates, and references.  Most surprisingly, he accused the Roosevelts of exhibiting an extraordinarily degree of familial financial corruption, which he claimed may have been unprecedented in American history.  Apparently, despite his wealthy and elite background FDR's eldest son Elliott never attended college and had essentially no professional qualifications in anything.  But soon after FDR became president, he began soliciting large personal payments and ﷺinvestmentsﷺ from wealthy businessmen who needed favors from the massively growing federal government, and seemingly did so with FDR's full knowledge and approval.  The situation sounded a little like Billy Carter's notorious activities during the late 1970s, but the money involved totaled as much as $50 million in present-day dollars relative to the household income of that era.  I had never heard a word about this.

Even more shocking was the case of First Lady Eleanor Roosevelt, who also had never attended college and apparently had little formal education of any sort. Soon after FDR was inaugurated, she began a major round of very well-paid personal advertising for corporate consumer products such as soap and took all sorts of other large payments over the next few years from various businesses, especially those crucially dependent upon government regulatory decisions. Imagine if recent First Ladies such as Michelle Obama or Laura Bush were constantly seen in TV ads hawking cars and diapers and fast food.  The payments Eleanor personally received over the course of the FDR's dozen years in office allegedly came to an astonishing $150 million, again relative to current family incomes.  This, too, was something that I had never suspected.  And all this was occurring during the very depths of the Great Depression, when a huge fraction of the country was desperately poor.  Perhaps Juan and Eva Peron just didn't hire the right PR people or simply aimed too low.

Obviously, the unprecedented growth in the spending and regulatory

power of the federal government during the New Deal years increased opportunities for this sort of personal graft by an enormous amount. But Flynn notes how odd the situation seemed since FDR's inherited fortune meant that he had already come into office as one of the wealthiest presidents of modern times. And as far as I've heard, his successor Harry S. Truman left the White House about as poor as he had entered it.

Some of Flynn's other shocking claims were easier to verify. He argues that the New Deal was largely a failure and in support of that contention notes that when FDR entered office in 1933 there were 11 million unemployed and in 1938 after six years of enormous government spending and deficits and the creation of an alphabet soup of New Deal programs there were…11 million unemployed. That claim appears to be factually correct.

Indeed, Flynn alleges that by late 1937, FDR had turned towards an aggressive foreign policy aimed at involving the country in a major foreign war, primarily because he believed that this was the only route out of his desperate economic and political box, a stratagem not unknown among national leaders throughout history. In his January 5, 1938 *New Republic* column, he alerted his disbelieving readers to the looming prospect of a large naval military build-up and warfare on the horizon after a top Roosevelt adviser had privately boasted to him that a large bout of military Keysianism and a major war would cure the country's seemingly insurmountable economic problems. At that time, war with Japan, possibly over Latin American interests, seemed the intended goal, but developing events in Europe soon persuaded FDR that fomenting a general war against Germany was the best course of action. Memoirs and other historical documents obtained by later researchers seem to generally support Flynn's accusations by indicating that Roosevelt ordered his diplomats to exert enormous pressure upon both the British and Polish governments to avoid any negotiated settlement with Germany, thereby leading to the outbreak of World War II in 1939.

Such an interventionist foreign policy may have represented a remarkable reversal of Roosevelt's promises. All my introductory history books had always indicated that an Isolationist-leaning Congress had passed the various Neutrality Acts of the mid-1930s over FDR's strong opposition and that these were intended to handcuff him. But according to Flynn, FDR had not only initially proposed that very legislation to his close Congressional allies, but actually made his personal advocacy and support for the Neutrality laws ones of the most popular centerpieces of his successful 1936 reelection campaign,

thereby helping him carry the Mid West against Kansas Gov. Alf Landon. Once gain, Flynn provides a very specific and detailed description of that history. Unsurprisingly, Wikipedia provides the opposite, totally conventional account.

Leaving aside the extraordinary level of family financial corruption alleged by Flynn, his portrayal of FDR reminds me more of W than any other recent president. We must remember that W had run for office promising a humble foreign policy and the removal of various kinds of anti-Muslim government profiling, but quickly reversed himself when the 9/11 attacks gave him the opportunity to enter the history books as a war president.

The background of the book's publication provides an indication of the publication obstacles faced by critics of government policy. Notwithstanding Flynn's outsize reputation and his previous string of best-sellers, his manuscript was rejected by virtually every major publisher, and in desperation, he finally turned to an obscure Irish-American house. Yet despite such an inauspicious launch and his near-complete exclusion from mainstream media outlets, his book quickly rose to the #2 spot on *The New York Times* list. Merely a decade earlier, he had been at the pinnacle of American influence, and the ongoing blacklisting by the mainstream media had apparently not yet fully managed to smother his memory.

Although Flynn was perhaps the most prominent public figure to disappear from public visibility around that time, he was hardly alone. As I began to explore the aggregate contents of so many of the publications that had influenced our ideas since the 19th century, I detected a significant discontinuity centered around a particular period. Quite a number of individuals—Left, Right, and Center—who had been so prominently featured until that point suddenly disappeared, in many cases permanently, near the start of the Great American Purge of the 1940s.

I sometimes imagined myself a little like an earnest young Soviet researcher of the 1970s who began digging into the musty files of long-forgotten Kremlin archives and made some stunning discoveries. Trotsky was apparently not the notorious Nazi spy and traitor portrayed in all the textbooks, but instead had been the right-hand man of the sainted Lenin himself during the glorious days of the great Bolshevik Revolution, and for some years afterward had remained in the topmost ranks of the Party elite. And who were these other

figures—Zinoviev, Kamenev, Bukharin, Rykov—who also spent those early years at the very top of the Communist hierarchy? In history courses, they had barely rated a few mentions, as minor Capitalist agents who were quickly unmasked and paid for their treachery with their lives. How could the great Lenin, father of the Revolution, have been such an idiot to have surrounded himself almost exclusively with traitors and spies?

But unlike their Stalinist analogs from a couple of years earlier, the American victims who disappeared around 1940 were neither shot nor Gulaged, but merely excluded from the mainstream media that defines our reality, thereby being blotted out from our memory so that future generations gradually forgot that they had ever lived.

Sometimes echoes of their former existence remained in the most unlikely contemporary contexts. For example during the early 2000s when I occasionally browsed websites of the ultra-right fringe, I might sometimes see favorable references to some totally unknown individual named "Harry Elmer Barnes," who apparently seemed to have been some long-forgotten homegrown Fascist ideologue of the 1930s.

Imagine my shock at later discovering that Barnes had actually been one of the most frequent early contributors to *Foreign Affairs*, serving as a primary book reviewer for that venerable publication from its 1922 founding onward, while his stature as one of America's premier liberal academics was indicated by his scores of appearances in *The Nation* and *The New Republic* throughout that decade. Indeed, he is credited with having played a central role in "revising" the history of the First World War so as to remove the cartoonish picture of unspeakable German wickedness left behind as a legacy of the dishonest wartime propaganda produced by the opposing British and American governments. And his professional stature was demonstrated by his thirty-five or more books, many of them influential academic volumes, along with his numerous articles in *The American Historical Review*, *Political Science Quarterly*, and other leading journals.

A few years ago I happened to mention Barnes to an eminent American academic scholar whose general focus in political science and foreign policy was quite similar, and yet the name meant nothing. By the end of the 1930s, Barnes had become a leading critic of America's proposed involvement in World War II, and was permanently "disappeared" as a consequence, barred from all mainstream media outlets, while a major newspaper chain was heavily

pressured into abruptly terminating his long-running syndicated national column in May 1940.

In many respects, Barnes' situation typified those who fell in the purge. Although many powerful critics of FDR's presidency seem to have suffered from a considerable amount of government investigation and IRS harassment throughout the 1930s, America's movement towards involvement in a new world war seems to have been the central factor behind a wider purge of public intellectuals and other political opponents. The combined influence of the pro-British Eastern Establishment together with powerful Jewish groups was deployed to clear the media of opposing figures, and after the Germans broke the Hitler-Stalin Pact by attacking the USSR in June 1941, Communists and other leftists also joined this effort. Polls seem to have shown that as much as 80% of the American public was opposed to such military involvement, so any prominent political or media figure giving voice to that popular super-majority needed to be silenced.

Over a dozen years after his disappearance from our national media, Barnes managed to publish *Perpetual War for Perpetual Peace*, a lengthy collection of essays by scholars and other experts discussing the circumstances surrounding America's entrance into World War II, and have it produced and distributed by a small printer in Idaho. His own contribution was a 30,000 word essay entitled "Revisionism and the Historical Blackout" and discussed the tremendous obstacles faced by the dissident thinkers of that period.

The book itself was dedicated to the memory of his friend, historian Charles A. Beard. Since the early years of the 20th century, Beard had ranked as an intellectual figure of the greatest stature and influence, co-founder of The New School in New York and serving terms as president of both The American Historical Association and The American Political Science Association. As a leading supporter of the New Deal economic policies, he was overwhelmingly lauded for his views.

Yet once he turned against Roosevelt's bellicose foreign policy, publishers shut their doors to him, and only his personal friendship with the head of the Yale University Press allowed his critical 1948 volume *President Roosevelt and the Coming of the War, 1941* to even appear in print. Beard's stellar reputation seems to have begun a rapid decline from that point onward, so that by 1968 historian Richard Hofstadter could write: "Today Beard's reputation stands like an imposing ruin in the landscape of American historiography. What

was once the grandest house in the province is now a ravaged survival&#65533;. Indeed, Beard's once-dominant &#65533;economic interpretation of history&#65533; might these days almost be dismissed as promoting &#65533;dangerous conspiracy theories,&#65533; and I suspect few non-historians have even heard of him.

Another major contributor to the Barnes volume was William Henry Chamberlin, who for decades had been ranked among America's leading foreign policy journalists, with more than 15 books to his credit, most of them widely and favorably reviewed. Yet *America's Second Crusade*, his critical 1950 analysis of America's entry into World War II, failed to find a mainstream publisher, and when it did appear was widely ignored by reviewers. Prior to its publication, his byline had regularly run in our most influential national magazines such as *The Atlantic Monthly* and *Harpers*. But afterward, his writing was almost entirely confined to small circulation newsletters and periodicals, appealing to narrow conservative or libertarian audiences.

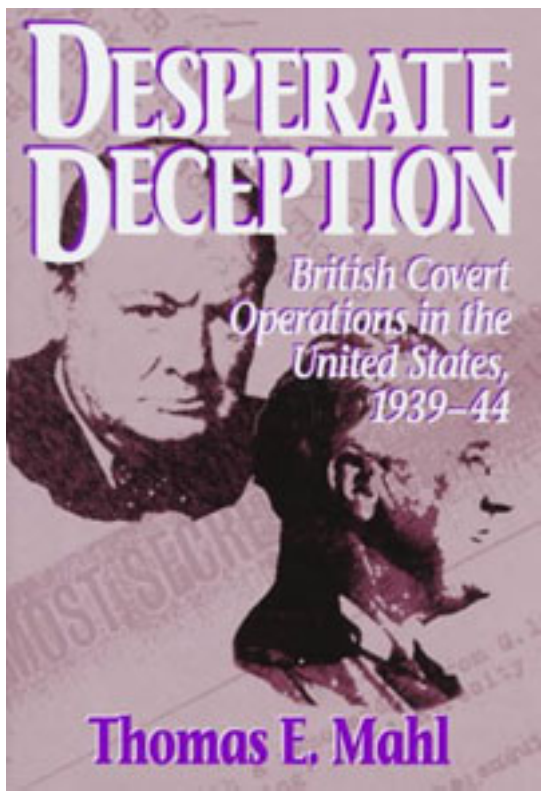
In these days of the Internet, anyone can easily establish a website to publish his views, thus making them immediately available to everyone in the world. Social media outlets such as Facebook and Twitter can bring interesting or controversial material to the attention of millions with just a couple of mouse-clicks, completely bypassing the need for the support of establishmentarian intermediaries. It is easy for us to forget just how extremely challenging the dissemination of dissenting ideas remained back in the days of print, paper, and ink, and recognize that an individual purged from his regular outlet might require many years to regain any significant foothold for the distribution of his work.

And this situation actually understates the tremendous obstacles faced by Flynn, Barnes, and similar writers, which they themselves probably did not fully recognize at the time. We must remember that by the early 1950s, television and films had only just begun to displace all other forms of media in their reach and influence, but soon the three networks and the handful of Hollywood studios began to enjoy an overwhelming stranglehold on the popular interpretation of historical events and all other types of information. So although many of the once-prominent individuals we have discussed sometimes retained a foothold in books, small-circulation magazines, and even some radio broadcasts, their total exclusion from TV and movies effectively transformed them into un-persons.

Given the remarkable prosperity and domestic tranquility of the 1950s, most ordinary Americans were reasonably content, and saw no

great need to question the veracity of what they heard and saw on their magical screens, whether small or large. If once-prominent but now half-forgotten intellectuals sought to rehash the past political decisions of 15 or 20 years earlier, they inevitably attracted small audiences.

The year 1940 seemed to mark the point at which some of the most significant dissenting voices in the national media were either removed or intimidated into silence. Once that had been accomplished, the strategic landscape obviously shifted, facilitating political maneuvers that might have been far more difficult under a climate of robust press scrutiny.



Given the overwhelming popular opposition to war intervention, Roosevelt's prospects for an unprecedented third term might have seemed difficult, since he would either be forced to strongly commit himself to that position or else risk defeat against his Republican opponent, drawn from a party that was overwhelmingly anti-interventionist. But in one of the most unlikely twists in all of American political history, the June 1940 Republican convention held

in Chicago selected as its nominee the obscure Wendell Willkie, a strongly pro-interventionist individual who had never previously held any public office and until just a few months earlier had been a committed lifelong Democrat. Two decades ago, historian Thomas E. Mahl thoroughly documented that British intelligence agents played a crucial role in that extremely unexpected turn of events, quite possibly even employing lethal means. The resulting Roosevelt-Willkie race thus provided voters virtually no choice on foreign policy matters, and FDR was reelected in a huge landslide, thereby largely freeing his hands to pursue a much more aggressive foreign policy.

Alarmed by their growing fear that America might be drawn into another world war without voters having had any say in the matter, a group of Yale Law students launched an anti-interventionist political organization that they named "The America First Committee," and it quickly grew to 800,000 members, becoming the largest grass-roots political organization in our national history. Numerous prominent public figures joined or supported it, with the chairman of Sears, Roebuck serving as its head, and its youthful members included future presidents John F. Kennedy and Gerald Ford as well as other notables such as Gore Vidal, Potter Stewart, and Sargent Schriver. Flynn served as chairman of the New York City chapter, and the organization's leading public spokesman was famed aviator Charles Lindbergh, who for decades had probably ranked as America's greatest national hero.

Throughout 1941, enormous crowds across the country attended anti-war rallies addressed by Lindbergh and the other leaders, with many millions more listening to the radio broadcasts of the events. Mahl shows that British agents and their American supporters meanwhile continued their covert operations to counter this effort by organizing various political front-groups advocating American military involvement, and employing fair means or foul to neutralize their political opponents. Jewish individuals and organizations seem to have played an enormously disproportionate role in that effort.

At the same time, the Roosevelt Administration escalated its undeclared war against German submarines and other naval forces in the Atlantic, unsuccessfully seeking to provoke an incident that might stampede the country into war. FDR also promoted the most bizarre and ridiculous propaganda inventions aimed at terrifying naive Americans, such as claiming to have proof that the Germans—who possessed no large surface navy and were completely stymied by the English Channel—had formulated concrete plans to leap across two thousand miles of the Atlantic Ocean and seize control of Latin

America. British agents supplied some of the crude forgeries he cited as evidence.

These facts, now firmly established by decades of scholarship, provide some necessary context to Lindbergh's famously controversial speech at an America First rally in September 1941. At that event, he charged that three groups in particular were "pressing this country toward war[:] the British, the Jewish, and the Roosevelt Administration," and thereby unleashed an enormous firestorm of media attacks and denunciations, including widespread accusations of anti-Semitism and Nazi sympathies. Given the realities of the political situation, Lindbergh's statement constituted a perfect illustration of Michael Kinsley's famous quip that "a gaffe is when a politician tells the truth – some obvious truth he isn't supposed to say." But as a consequence, Lindbergh's once-heroic reputation suffered enormous and permanent damage, with the campaign of vilification echoing for the remaining three decades of his life, and even well beyond. Although he was not entirely purged from public life, his standing was certainly never even remotely the same.

Meanwhile, FDR's drive to have America enter the war continued on various parallel tracks. Over the years, diplomatic historians have demonstrated that faced with such stubborn domestic opposition to direct military intervention in Europe, the Roosevelt Administration undertook a wide range of steps directly intended to provoke a Japanese attack and thereby achieve a "back door to war" as Prof. Charles C. Tansill later entitled his important 1952 book on that history. These measures include a complete freeze on Japanese assets, an embargo on the oil absolutely vital to the Japanese military, and the summary rejection of the Japanese Prime Minister's personal plea to hold top-level governmental negotiations aimed at maintaining peace. As early as May 1940, FDR had ordered the Pacific Fleet relocated from its San Diego home port to Pearl Harbor in Hawaii, a decision strongly opposed as unnecessarily provocative and dangerous by James Richardson, its commanding admiral, who was fired as a result.

Thus, the Japanese attack on December 7, 1941 actually marked the success of Roosevelt's strategy by putting America into the war. Indeed, some scholars have even pointed to considerable evidence that the highest levels of the U.S. government were fully aware of the impending attack and allowed it to proceed in order to ensure that a sufficiently large number of American casualties would sweep away all popular obstacles to full-scale involvement in the world war.

There was also a very strange domestic incident that immediately followed the Pearl Harbor attack, one which seems to have attracted far too little interest. In that era, films were the most powerful popular media, and although Gentiles constituted 97% of the population, they controlled only one of the major studios; perhaps coincidentally, Walt Disney was also the only high-ranking Hollywood figure perched squarely within the anti-war camp. And the day after the surprise Japanese attack, hundreds of U.S. troops seized control of Disney Studios, allegedly in order to help defend California from Japanese forces located thousands of miles away, with the military occupation continuing for the next eight months. Consider what suspicious minds might have thought if on September 12, 2001, President Bush had immediately ordered his military to seize the CBS network offices, claiming that such a step was necessary to help protect New York City against further Islamicist attacks.

Most of us live within a comfortable framework of what we have been taught and therefore believe to be true, and breaking out of that sheltering cocoon often entails considerable mental adjustments. This was certainly the case for me a dozen years ago as I increasingly noticed the sharp divergence between the claims and implications of my history books and the actual facts contained within the scanned pages of old publications.

The notion of a sweeping purge of media dissidents in the past seemed far easier for me to accept when I myself had witnessed something rather similar only a couple of years earlier, once again aimed at clearing away the obstacles to an American foreign war.

In the patriotic fervor following the 9/11 attacks, few national media figures dared challenge the plans and proposals of the Bush Administration, with Paul Krugman's column at the *Times* being a very rare exception; expressing "unpatriotic sentiments" as very broadly defined could severely impact a career. This was especially true of the electronic media, with its vastly greater reach and therefore subject to more extreme pressure. During 2002 and 2003, it was very rare to find an Iraq War naysayer anywhere on network television or among the fledgling cable alternatives, and even MSNBC, the least popular and most liberal of the latter soon began a sharp ideological crackdown.

For decades, Phil Donahue had pioneered the daytime television talk show, and in 2002 he revived it to high ratings on MSNBC, but in

early 2003 his show was canceled, with a leaked memo indicated that his opposition to the looming war was the cause. Conservative Pat Buchanan and liberal Bill Press, both Iraq War critics, hosted a top-rated debate show on the same network, allowing them to spar with their more pro-Bush opponents, but it too was cancelled for similar reasons. If the cable network's most famous hosts and highest rated programs were subject to summary termination, lesser ranking personalities surely drew the appropriate conclusions about the risks of crossing particular ideological lines.

My old friend Bill Odom, the three-star general who ran the NSA for Ronald Reagan and possessed among the strongest national security credentials in DC was similarly blacklisted from the media for his opposition to the Iraq War. Numerous other prominent media voices were "disappeared" around the same time, and even after Iraq became universally recognized as an enormous disaster, most of them never regained their perches.

By this time the early Internet had come into existence, so these media disappearances were often noted by angry commentators, and therefore less completely effective. Buchanan might no longer have a show on cable television, but his pungent print commentaries were still available on the web, and the same was true for others. However, the political impact of an audience of thousands of selected website readers was very different than that of a national audience of millions of mainstream viewers.

When we seek to understand the past, we must be careful to avoid drawing from a narrow selection of sources, especially if one side proved politically victorious in the end and completely dominated the later production of books and other commentary. Prior to the existence of the Internet, this was an especially difficult task, often requiring a considerable amount of scholarly effort, even if only to examine the bound volumes of once popular periodicals. Yet without such diligence, we can fall into very serious error.

The Iraq War and its aftermath was certainly one of the central events in American history during the 2000s. Yet suppose some readers in the distant future had only the collected archives of *The Weekly Standard*, *National Review*, the *WSJ* op-ed page, and *FoxNews* transcripts to furnish their historical understanding of that period, perhaps along with the books written by the contributors to those outlets. I doubt that more than a small fraction of what they would read could be categorized as outright lies. But the massively skewed coverage, the distortions, exaggerations, and especially the

breathtaking omissions would surely provide them with an exceptionally unrealistic view of what had actually happened during that important period.

Over the last fifteen-odd years, I've gradually come to believe that exactly the same is probably true of much of the American history I had always assumed that I knew.

# The JFK Assassination, Part I - What Happened?

June 18, 2018 • 4,800 Words

About a decade ago, I got a Netflix subscription and was amazed that the Internet now provided immediate access to so many thousands of movies on my own computer screen. But after a week or two of heavy use and the creation of a long watch-list of prospective films I'd always wanted to see, my workload gained the upper hand, and I mostly abandoned the system.

Back then, nearly all Netflix content was licensed from the major studios and depending upon contract negotiations might annually disappear, so when I happened to browse my account again in December, I noticed that a couple of films on my selection list included warning notices saying they would no longer be available on January 1st. One of these was Oliver Stone's famous 1991 film *JFK*, which had provoked quite a stir at the time, so thinking now or never, I clicked the *Play* button, and spent three hours that evening watching the Oscar winner.

Most of the plot seemed bizarre and outlandish to me, with the president's killing in Dallas supposedly having been organized by a cabal of militantly anti-Communist homosexuals, somehow connected with both the CIA and the mafia, but based in New Orleans. Kevin Costner starred as a crusading District Attorney named Jim Garrison—presumably fictional—whose investigation broke the assassination conspiracy wide open before the subtle tentacles of the Deep State finally managed to squelch his prosecution; or at least that's what I vaguely remember from my single viewing. With so many implausible elements, the film confirmed my belief in the wild imagination of Hollywood scriptwriters and also demonstrated why no one with any common sense had ever taken seriously those ridiculous JFK conspiracy theories.

Despite its dramatic turns, the true circumstances of President John F. Kennedy's death seemed an island of sanity by comparison. Lee Harvey Oswald, a disgruntled young marine had defected to the USSR in 1959 and finding life behind the Iron Curtain equally unsatisfactory, returned to America a couple of years later. Still having confused Marxist sympathies, he'd joined public protests

supporting Fidel Castro's Cuba, and gradually turning toward violence, purchased a mail-order rifle. During the presidential visit, he had fired three shots from the Dallas School Book Depository, killing JFK, and was quickly apprehended by the local police. Soon, he too was dead, shot by an outraged Kennedy supporter named Jack Ruby. All these sad facts were later confirmed by the Warren Commission in DC, presided over by the U.S. Chief Justice together with some of America's most respected public figures, and their voluminous report ran nearly 900 pages.

Yet although the film seemed to have affixed an enormous mass of incoherent fictional lunacy on top of that basic history—why would a murder plot in Dallas have been organized in New Orleans, five hundred miles distant?—one single detail troubled me. Garrison is shown denouncing the "lone gunman theory" for claiming that a single bullet was responsible for seven separate wounds in President Kennedy and Texas Gov. John Connolly, seated in front of him in the limousine. Now inventing gay CIA assassins seems pretty standard Hollywood fare, but I found it unlikely that anyone would ever insert a fictional detail so wildly implausible as that bullet's trajectory. A week or so later, the memory popped into my head, and I googled around a bit, discovering to my total astonishment that the seven-wounds-from-one-bullet claim was totally factual, and indeed constituted an absolutely essential element of the orthodox "single gunman" framework given that Oswald had fired at most three shots. So *that* was the so-called "Magic Bullet" I'd occasionally seen conspiracy-nuts ranting and raving about. For the first time in my entire life, I started to wonder whether maybe, just *maybe* there actually *had* been some sort of conspiracy behind the most famous assassination in modern world history.

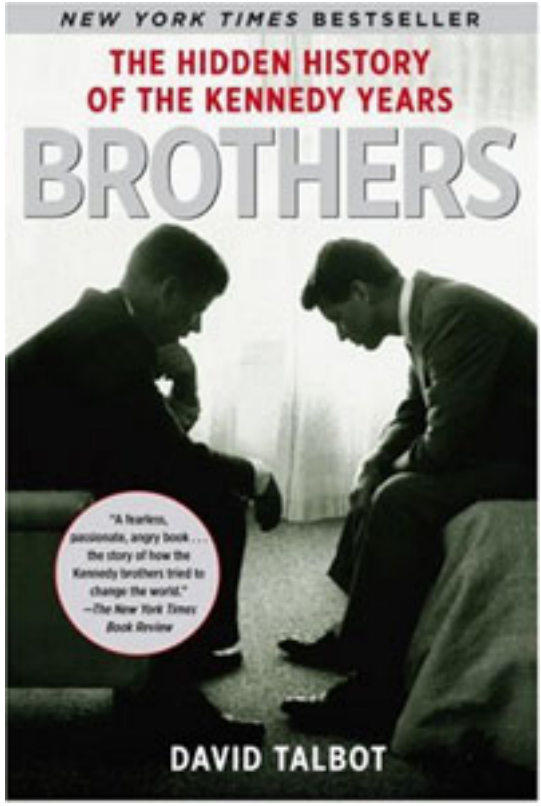
Any conspirators had surely died of old age many years or even decades earlier and I was completely preoccupied with my own work, so investigating the strange circumstances of JFK's death was hardly a high personal priority. But the suspicions remained in the back of my mind as I diligently read my *New York Times* and *Wall Street Journal* every morning while periodically browsing less reputable websites during the afternoon and evening. And as a result, I now began noticing little items buried here and there that I would have previously ignored or immediately dismissed, and these strengthened my newly emerging curiosity.

Among other things, occasional references reminded me that I'd previously seen my newspapers discuss a couple of newly released JFK books in rather respectful terms, which had surprised me a bit at the

time. One of them, still generating discussion, was *JFK and the Unspeakable* published in 2008 by James W. Douglass, whose name meant nothing to me. And the other, which I hadn't originally realized trafficked in any assassination conspiracies, was David Talbot's 2007 *Brothers: The Hidden History of the Kennedy Years*, focused on the relationship between John F. Kennedy and his younger brother Robert. Talbot's name was also somewhat familiar to me as the founder of *Salon.com* and a well-regarded if liberal-leaning journalist.

None of us have expertise in all areas, so sensible people must regularly delegate their judgment to credible third-parties, relying upon others to distinguish sense from nonsense. Since my knowledge of the JFK assassination was nil, I decided that two recent books attracting newspaper coverage might be a good place to start. So perhaps a couple of years after watching that Oliver Stone film, I cleared some time in my schedule, and spent a few days carefully reading the combined thousand pages of text.

I was stunned at what I immediately discovered. Not only was the evidence of a "conspiracy" absolutely overwhelming, but whereas I'd always assumed that only kooks doubted the official story, I instead discovered that a long list of the most powerful people near the top of the American government and in the best position to know had been privately convinced of such a "conspiracy," in many cases from almost the very beginning.



NEW YORK TIMES BESTSELLER
THE HIDDEN HISTORY
OF THE KENNEDY YEARS
BROTHERS
"A fearless, passionate, angry book . . . the story of how the Kennedy brothers tried to change the world."
—The New York Times Book Review
DAVID TALBOT

The Talbot book especially impressed me, being based on over 150 personal interviews and released by *The Free Press*, a highly reputable publisher. Although he applied a considerable hagiographic gloss to the Kennedys, his narrative was compellingly written, with numerous gripping scenes. But while such packaging surely helped to explain some of the favorable treatment from reviewers and how he had managed to produce a national bestseller in a seemingly long-depleted field, for me the packaging was much less important than the product itself.

To the extent that notions of a JFK conspiracy had ever crossed my mind, I'd considered the argument from silence absolutely conclusive. Surely if there had been the slightest doubt of the "lone gunman" conclusion endorsed by the Warren Commission, Attorney-General Robert Kennedy would have launched a full investigation to avenge his slain brother.

But as Talbot so effectively demonstrates, the reality of the political situation was entirely different. Robert Kennedy may have begun that fatal morning widely regarded as the second most powerful man in the country, but the moment his brother was dead and his bitter

personal enemy Lyndon Johnson sworn in as the new president, his governmental authority almost immediately ebbed away. Longtime FBI Director J. Edgar Hoover, who had been his hostile subordinate, probably scheduled for removal in JFK's second term, immediately became contemptuous and unresponsive to his requests. Having lost all his control over the levers of power, Robert Kennedy lacked any ability to conduct a serious investigation.

According to numerous personal interviews, he had almost immediately concluded that his brother had been struck down at the hands of an organized group, very likely including elements from within the U.S. government itself, but he could do nothing about the situation. As he regularly confided to close associates, his hope at the age of 38 was to reach the White House himself at some future date, and with the government in his hands then uncover his brother's killers and bring them to justice. But until that day, he could do nothing, and any unsubstantiated accusations he made would be totally disastrous both for national unity and for his own personal credibility. So for years, he was forced to nod his head and publicly acquiesce to the official story of his brother's inexplicable assassination at the hands of a lone nut, a fairy tale publicly endorsed by nearly the entire political establishment, and this situation deeply gnawed at him. Moreover, his own apparent acceptance of that story was often interpreted by others, not least in the media, as his wholehearted endorsement.

Although discovering Robert Kennedy's true beliefs was a crucial revelation in the Talbot book, there were many others. At most three shots had allegedly come from Oswald's rifle, but Roy Kellerman, the Secret Service agent in the passenger seat of JFK's limousine, was sure there had been more than that, and to the end of his life always believed there had been additional shooters. Gov. Connolly, seated in front of JFK and severely wounded in the attack, had exactly the same opinion. CIA Director John McCone was equally convinced that there had been multiple shooters. Across the pages of Talbot's book, I learned that dozens of prominent, well-connected individuals privately expressed extreme skepticism towards the official "lone gunman theory" of the Warren Commission, although such doubts were very rarely made in public or on the record.

For a variety of complex reasons, the leading national media organs—the commanding heights of "Our American Pravda"—almost immediately endorsed the "lone gunman theory" and with some exceptions generally maintained that stance throughout the next half-century. With few prominent critics willing to publicly dispute that

idea and a strong media tendency to ignore or minimize those exceptions, casual observers such as myself had generally received a severely distorted view of the situation.

If the first two dozen pages of the Talbot book completely overturned my understanding of the JFK assassination, I found the closing section almost equally shocking. With the Vietnam War as a political millstone about his neck, President Johnson decided not to seek reelection in 1968, opening the door to a last minute entry into the Democratic race by Robert Kennedy, who overcame considerable odds to win some important primaries. Then on June 4, 1968, he carried gigantic winner-take-all California, placing him on an easy path to the nomination and the presidency itself, at which point he would finally be in a position to fully investigate his brother's assassination. But minutes after his victory speech, he was shot and fatally wounded, allegedly by another lone gunman, this time a disoriented Palestinian immigrant named Sirhan Sirhan, supposedly outraged over Kennedy's pro-Israel public positions, although these were no different than those expressed by most other political candidates in America.

All this was well known to me. However, I had not known that powder burns later proved that the fatal bullet had been fired directly behind Kennedy's head from a distance of three inches or less although Sirhan was standing several feet in front of him. Furthermore, eyewitness testimony and acoustic evidence indicated that at least twelve bullets were fired although Sirhan's revolver could hold only eight, and a combination of these factors led longtime LA Coroner Dr. Thomas Naguchi, who conducted the autopsy, to claim in his 1983 memoir that there was likely a second gunman. Meanwhile, eyewitnesses also reported seeing a security guard with his gun drawn standing immediately behind Kennedy during the attack, and that individual happened to have a deep political hatred of the Kennedys. The police investigators seemed uninterested in these highly suspicious elements, none of which came to light during the trial. With two Kennedy brothers now dead, neither any surviving members of the family nor most of their allies and retainers had any desire to investigate the details of this latest assassination, and in a number of cases they soon moved overseas, abandoning the country entirely. JFK's widow Jackie confided in friends that she was terrified for the lives of her children, and quickly married Aristotle Onassis, a Greek billionaire, whom she felt would be able to protect them.

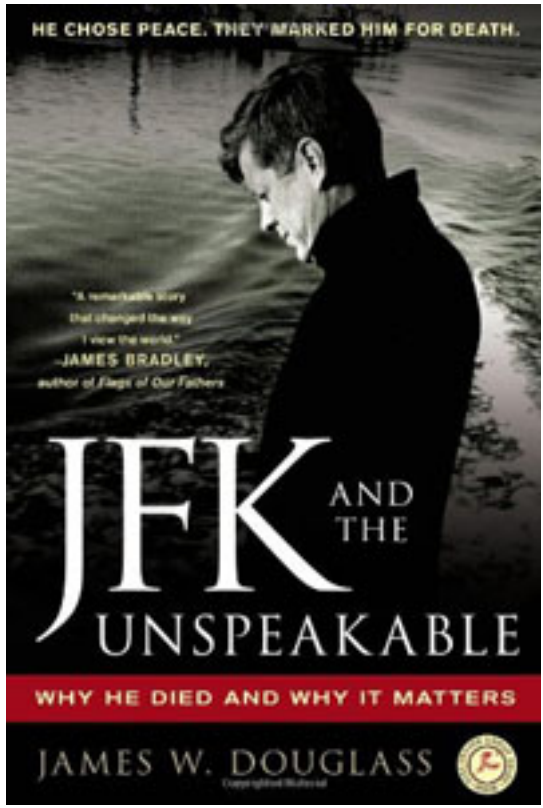
Talbot also devotes a chapter to the late 1960s prosecution efforts of New Orleans DA Jim Garrison, which had been the central plot of the *JFK* film, and I was stunned to discover that the script was almost

entirely based on real life events rather than Hollywood fantasy. This even extended to its bizarre cast of assassination conspiracy suspects, mostly fanatically anti-Communist Kennedy-haters with CIA and organized crime ties, some of whom were indeed prominent members of the New Orleans gay demimonde. Sometimes real life is far stranger than fiction.

Taken as a whole, I found Talbot's narrative quite convincing, at least with respect to demonstrating the existence of a substantial conspiracy behind the fatal event.

Others certainly had the same reaction, with the august pages of *The New York Times Sunday Book Review* carrying the strongly favorable reaction of presidential historian Alan Brinkley. As the Allan Nevins Professor of History and Provost of Columbia University, Brinkley is as mainstream and respectable an academic scholar as might be imagined and he characterized Talbot as

> the latest of many intelligent critics who have set out to demolish the tottering credibility of the Warren Commission and draw attention to evidence of a broad and terrible conspiracy that lay behind the assassination of John Kennedy — and perhaps the murder of Robert Kennedy as well.



HE CHOSE PEACE. THEY MARKED HIM FOR DEATH.
–JAMES BRADLEY,
author of Flags of Our Fathers
JFK AND THE UNSPEAKABLE
WHY HE DIED AND WHY IT MATTERS
JAMES W. DOUGLASS

The other book by Douglass, released a year later, covered much the same ground and came to roughly similar conclusions, with substantial overlap but also including major additional elements drawn from the enormous volume of extremely suspicious material unearthed over the decades by diligent JFK researchers. Once again, the often bitter Cold War era conflict between JFK and various much harder-line elements of his government over Cuba, Russia, and Vietnam is sketched out as the likely explanation for his death.

Summarizing a half-century of conspiracy research, the Talbot and Douglass books together provide a wealth of persuasive evidence that elements of organized crime, individuals with CIA connections, and anti-Castro Cubans were probably participants in the assassination plot. Oswald seems to have been working with various anti-Communist groups and also had significant connections to U.S. intelligence, while his purported Marxism was merely a very thin disguise. With regard to the assassination itself, he was exactly the "patsy" he publicly claimed to be, and very likely never fired a single shot. Meanwhile, Jack Ruby had a long history of ties to organized crime, and surely killed Oswald to shut his mouth.

Many others may have suffered a similar fate. Conspirators daring enough to strike at the president of the United States would hardly balk at using lethal means to protect themselves from the consequences of their action, and over the years a considerable number of individuals associated with the case in one way or another came to untimely ends.

Less than a year after the assassination, JFK mistress Mary Meyer, the ex-wife of high-ranking CIA official Cord Meyer, was found shot to death in a Washington DC street-killing with no indications of attempted robbery or rape, and the case was never solved. Immediately afterwards, CIA counterintelligence chief James Jesus Angleton was caught breaking into her home in search of her personal diary, which he later claimed to have destroyed.

Dorothy Kilgallen was a nationally-syndicated newspaper columnist and television personality, and she managed to wrangle an exclusive interview with Jack Ruby, later boasting to her friends that she would break the JFK assassination case wide open in her new book, producing the biggest scoop of her career. Instead, she was found dead in her Upper East Side townhouse, having apparently succumbed to an overdose of alcohol and sleeping pills, with both the draft text and the notes to her Jack Ruby chapter missing.

Shortly before Jim Garrison filed his assassination charges, his top suspect David Ferrie was found dead at age 48, possibly of natural causes, though the DA suspected foul play.

During the mid-1970s, the House Select Committee on Assassinations held a series of high-profile hearings to reopen and investigate the case, and two of the witnesses called were high-ranking mafia figures Sam Giancana and Johnny Rosselli, widely suspected of having been connected with the assassination. The former was shot to death in the basement of his home one week before he was scheduled to testify, and the body of the latter was found in an oil-drum floating in the waters off Miami after he had been subpoenaed for an additional appearance.

These were merely a few of the highest-profile individuals with a connection to the Dallas assassination whose lives were cut short in the years that followed, and although the deaths may have been purely coincidental, the full list is rather a long one.

Having read a couple of books that completely upended my settled beliefs about a central event of twentieth century history, I simply didn't know what to think. Over the years, my own writings had put me on friendly terms with a well-connected individual whom I considered a member of the elite establishment, and whose intelligence and judgment had always seemed extremely solid. So I decided to very gingerly raise the subject with him, and see whether he had ever doubted the "lone gunman" orthodoxy. To my total astonishment, he explained that as far back as the early 1990s, he'd become absolutely convinced in the reality of a "JFK conspiracy" and over the years had quietly devoured a huge number of the books in that field, but had never breathed a word in public lest his credibility be ruined and his political effectiveness destroyed.

A second friend, a veteran journalist known for his remarkably courageous stands on certain controversial topics, provided almost exactly the same response to my inquiry. For decades, he'd been almost 100% sure that JFK had died in a conspiracy, but once again had never written a word on the topic for fear that his influence would immediately collapse.

If these two individuals were even remotely representative, I began to wonder whether a considerable fraction, perhaps even a majority, of the respectable establishment had long harbored private beliefs about the JFK assassination that were absolutely contrary to the seemingly uniform verdict presented in the media. But with every such respectable voice keeping so silent, I had never once suspected a thing.

Few other revelations in recent years have so totally overturned my understanding of the framework of reality. Even a year or two later, I still found it very difficult to wrap my head around the concept, as I described in another note to that well-connected friend of mine:

> BTW, I hate to keep harping on it, but every time I consider the implications of the JFK matter I'm just more and more astonished.
>
> The president of the US. The heir to one of the wealthiest and most powerful families in America. His brother the top law enforcement officer in the country. Ben Bradlee, one of his closest friends, the fearless crusading editor of one of the nation's most influential media outlets. As America's first Catholic president, the sacred icon of many millions of Irish, Italian, and Hispanic families. Greatly beloved by top Hollywood people and many leading intellectuals.

His assassination ranks as one of the most shocking and dramatic events of the 20th century, inspiring hundreds of books and tens of thousands of news stories and articles, examining every conceivable detail. The argument from MSM silence always seemed absolutely conclusive to me.

From childhood, it's always been obvious to me that the MSM is completely dishonest about certain things and over the last dozen years I've become extremely suspicious about a whole range of other issues. But if you'd asked me a couple of years ago whether JFK was killed by a conspiracy, I would have said "well, anything's possible, but I'm 99% sure there's absolutely no substantial evidence pointing in that direction since the MSM would surely have headlined it a million times over."

Was there really a First World War? Well, I've always assumed there was, but who really knows?....

Our reality is shaped by the media, but what the media presents is often determined by complex forces rather than by the factual evidence in front of their eyes. And the lessons of the JFK assassination may provide some important insights into this situation.

A president was dead and soon afterward his supposed lone assassin suffered the same fate, producing a tidy story with a convenient endpoint. Raising doubts or focusing on contrary evidence might open doors better kept shut, perhaps endangering national unity or even risking nuclear war if the trail seemed to lead overseas. The highest law enforcement officer in the country was the slain president's own brother, and since he seemed to fully accept that simple framework, what responsible journalist or editor would be willing to go against it? What American center of power or influence had any strong interest in opposing that official narrative?

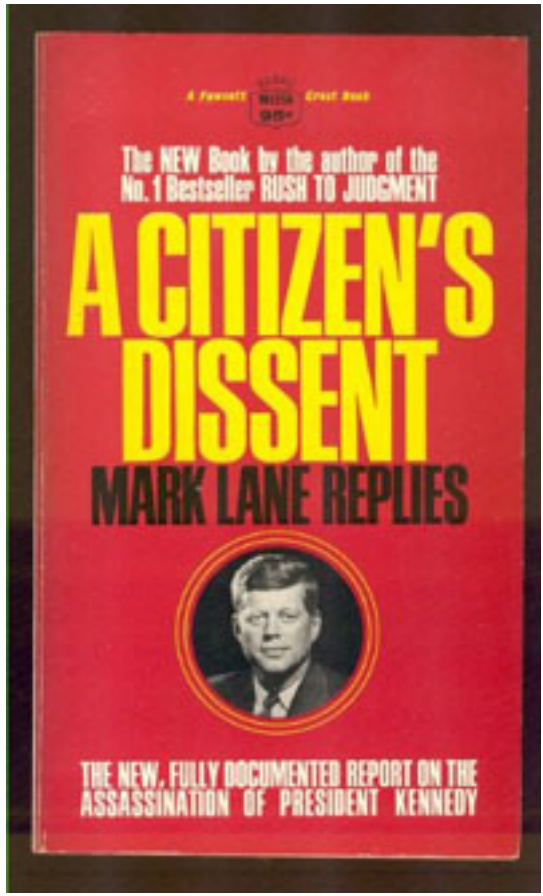
Certainly there was immediate and total skepticism overseas, with few foreign leaders ever believing the story, and figures such as Nikita Khrushchev, Charles DeGaulle, and Fidel Castro all immediately concluded that a political plot had been responsible for Kennedy's elimination. Mainstream media outlets in France and the rest of Western Europe were equally skeptical of the "lone gunman theory," and some of the most important early criticism of U.S. government claims was produced by Thomas Burnett, an expatriate American writing for one of the largest French newsweeklies. But in

pre-Internet days, only the tiniest sliver of the American public had regular access to such foreign publications, and their impact upon domestic opinion would have been nil.

Perhaps instead of asking ourselves why the "lone gunman" story was accepted, we should instead be asking why it was ever vigorously challenged, during an era when media control was extremely centralized in establishmentarian hands.

Oddly enough, the answer may lie in the determination of a single individual named Mark Lane, a left-liberal New York City attorney and Democratic Party activist. Although JFK assassination books eventually numbered in the thousands and the resulting conspiracy theories roiled American public life throughout the 1960s and 1970s, without his initial involvement matters might have followed a drastically different trajectory.

From the very first, Lane had been skeptical of the official story, and less than a month after the killing, *The National Guardian*, a small left-wing national newspaper, published his 10,000 word critique, highlighting major flaws in the "lone gunman theory." Although his piece had been rejected by every other national periodical, the public interest was enormous, and once the entire edition sold out, thousands of extra copies were printed in pamphlet form. Lane even rented a theater in New York City, and for several months gave public lectures to packed audiences.

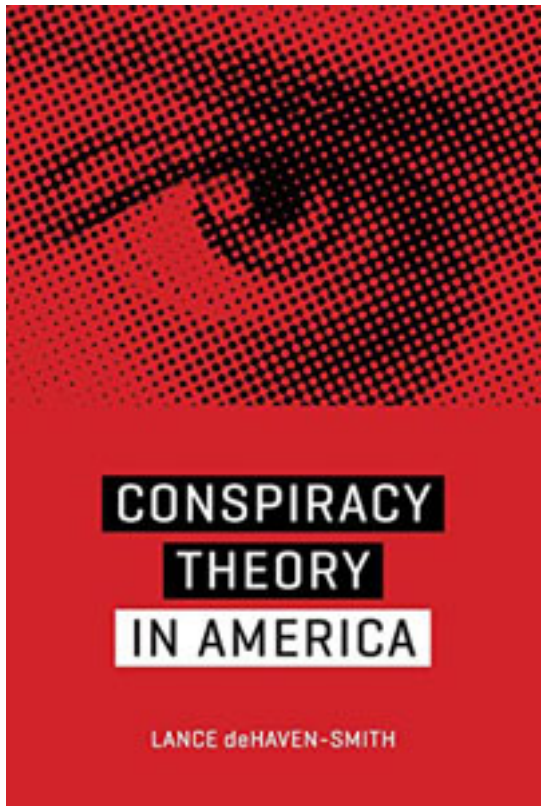


The NEW Book by the author of the
No. 1 Bestseller RUSH TO JUDGMENT
A CITIZEN'S
DISSENT
MARK LANE REPLIES
THE NEW, FULLY DOCUMENTED REPORT ON THE
ASSASSINATION OF PRESIDENT KENNEDY

After the Warren Commission issued its completely contrary official verdict, he began working on a manuscript, and although he faced enormous obstacles in finding an American publisher, once *Rush to Judgment* appeared, it spent a remarkable two years on the national bestseller lists, easily reaching the #1 spot. Such tremendous economic success naturally persuaded a host of other authors to follow suit, and an entire genre was soon established. Lane later published *A Citizens Dissent* recounting his early struggles to break the total American media blackout against anyone contradicting the official conclusion. Against all odds, he had succeeded in sparking a massive popular uprising sharply challenging the narrative of the establishment.

According to Talbot, "By late 1966, it was becoming impossible for the establishment media to stick with the official story" and the November 25, 1966 edition of *Life Magazine*, then at the absolute height of its national influence, carried the remarkable cover story "Did Oswald Act Alone?" with the conclusion that he probably did

not. The next month, *The New York Times* announced it was forming a special task force to investigate the assassination. These elements were to merge with the media furor soon surrounding the Garrison investigation that began the following year, an investigation that enlisted Lane as an active participant. However, behind the scenes a powerful media counterattack was also being launched at this same time.



In 2013 Prof. Lance deHaven-Smith, past president of the Florida Political Science Association, published *Conspiracy Theory in America*, a fascinating exploration of the history of the concept and the likely origins of the term itself. He noted that during 1966 the CIA had become alarmed at the growing national skepticism of the Warren Commission findings, especially once the public began turning its suspicious eyes toward the intelligence agency itself. Therefore, in January 1967 top CIA officials distributed a memo to all their local stations, directing them to employ their media assets and elite contacts to refute such criticism by various arguments, notably including an emphasis on Robert Kennedy's supposed endorsement of the ﷺlone gunman﷽ conclusion.

This memo, obtained by a later FOIA request, repeatedly used the term "conspiracy" in a highly negative sense, suggesting that "conspiracy theories" and "conspiracy theorists" be portrayed as irresponsible and irrational. And as I wrote in 2016,

> Soon afterward, there suddenly appeared statements in the media making those exact points, with some of the wording, arguments, and patterns of usage closely matching those CIA guidelines. The result was a huge spike in the pejorative use of the phrase, which spread throughout the American media, with the residual impact continuing right down to the present day.

This possible cause-and-effect relationship is supported by other evidence. Shortly after leaving *The Washington Post* in 1977, famed Watergate journalist Carl Bernstein published a 25,000 word *Rolling Stone* cover story entitled "The CIA and the Media" revealing that during the previous quarter century over 400 American journalists had secretly carried out assignments for the CIA according to documents on file at the headquarters of that organization. This influence project, known as "Operation Mockingbird," had allegedly been launched near the end of the 1940s by high-ranking CIA official Frank Wisner, and included editors and publishers situated at the very top of the mainstream media hierarchy.

For whatever reason, by the time I came of age and began following the national media in the late 1970s, the JFK story had become very old news, and all the newspapers and magazines I read provided the very strong impression that the "conspiracy theories" surrounding the assassination were total nonsense, long since debunked, and only of interest to kooks on the ideological fringe. I was certainly aware of the enormous profusion of popular conspiracy books, but I never had the slightest interest in looking at any of them. America's political establishment and its close media allies had outlasted the popular rebellion, and the name "Mark Lane" meant almost nothing to me, except vaguely as some sort of fringe-nut, who very occasionally rated a mention in my mainstream newspapers, receiving the same sort of treatment accorded to Scientologists or UFO activists.

Oddly enough, Talbot's treatment of Lane was also rather dismissive, recognizing his crucial early role in preventing the official narrative from quickly hardening into concrete, but also emphasizing his abrasive personality, and almost entirely ignoring his important later work on the issue, perhaps because so much of it had been conducted on the political fringe. Robert Kennedy and his close allies had similarly boycotted Lane's work from the very first, regarding him as a

meddlesome gadfly, but perhaps also ashamed that he was asking the questions and doing the work that they themselves were so unwilling to undertake at the time.  Douglass's 500 page book scarcely even mentions Lane.

Reading a couple of Lane's books, I was quite impressed by the enormous role he had seemingly played in the JFK assassination story, but I also wondered how much of my impression may have been due to the exaggerations of a possible self-promoter.  Then, on May 13, 2016 I opened my *New York Times* and found nearly a full page obituary devoted to Lane's death at age 89, the sort of treatment these days reserved for only the highest-ranking U.S. Senators or major rap stars.  And the 1,500 words were absolutely glowing, portraying Lane as a solitary, heroic figure struggling for decades to reveal the truth of the JFK assassination conspiracy against an entire political and media establishment seeking to suppress it.

I read this as a deep apology by America's national newspaper of record. *President John F. Kennedy was indeed killed by a conspiracy, and we are sorry we spent more than a half century suppressing that truth and ridiculing those who uncovered it.*

- American Pravda: the JFK Assassination, Part II – Who Did It?

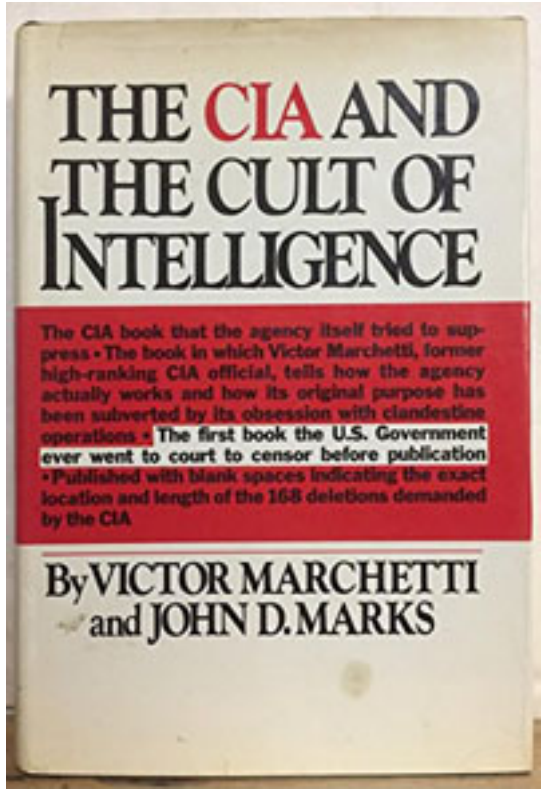
# The JFK Assassination, Part II – Who Did It?

June 25, 2018 • 8,000 Words

A strong dam may hold back an immense quantity of water, but once it breaks the resulting flood may sweep aside everything in its path. I had spent nearly my entire life never doubting that a lone gunman named Lee Harvey Oswald killed President John F. Kennedy nor that a different lone gunman took the life of his younger brother Robert a few years later. Once I came to accept that these were merely fairy tales widely disbelieved by many of the same political elites who publicly maintained them, I began considering other aspects of this important history, the most obvious being who was behind the conspiracy and what were their motives.

On these questions, the passage of a half-century and the deaths, natural or otherwise, of nearly all the contemporary witnesses drastically reduces any hope of coming to a firm conclusion. At best, we can evaluate possibilities and plausibilities rather than high likelihoods let alone near certainties. And given the total absence of any hard evidence, our exploration of the origins of the assassination must necessarily rely upon cautious speculation.

From such a considerable distance in time, a bird's-eye view may be a reasonable starting point, allowing us to focus on the few elements of the apparent conspiracy that seem reasonably well established. The most basic of these is the background of the individuals who appear to have been associated with the assassination, and the recent books by David Talbot and James W. Douglass effectively summarize much of the evidence accumulated over the decades by an army of diligent assassination researchers. Most of the apparent conspirators seem to have had strong ties to organized crime, the CIA, or various anti-Castro activist groups, with considerable overlap across these categories. Oswald himself certainly fit this same profile although he was very likely the mere patsy that he claimed to be, as did Jack Ruby, the man who quickly silenced him and whose ties to the criminal underworld were long and extensive.



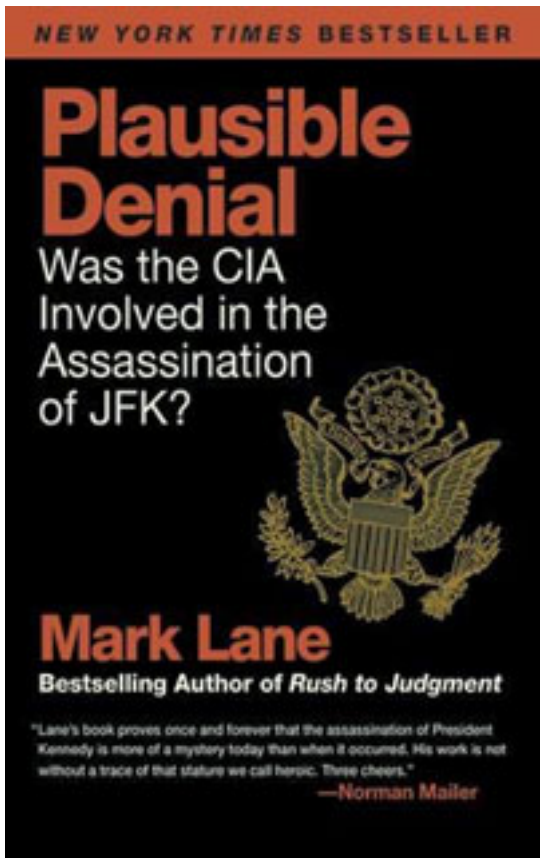
THE CIA AND THE CULT OF INTELLIGENCE
The CIA book that the agency itself tried to suppress • The book in which Victor Marchetti, former high-ranking CIA official, tells how the agency actually works and how its original purpose has been subverted by its obsession with clandestine operations • The first book the U.S. Government ever went to court to censor before publication • Published with blank spaces indicating the exact location and length of the 168 deletions demanded by the CIA
By VICTOR MARCHETTI and JOHN D. MARKS

An unusual chain of events provided some of the strongest evidence of CIA involvement. Victor Marchetti, a career CIA officer, had risen to become Special Assistant to the Deputy Director, a position of some importance, before resigning in 1969 over policy differences. Although he fought a long battle with government censors over his book, *The CIA and the Cult of Intelligence*, he retained close ties with many former agency colleagues.

During the 1970s, the revelations of the Senate Church Committee and the House Select Committee on Assassinations had subjected the CIA to a great deal of negative public scrutiny, and there were growing suspicions of possible CIA links to JFK's assassination. In 1978 longtime CIA Counter-intelligence chief James Angleton and a colleague provided Marchetti with an explosive leak, stating that the agency might be planning to admit a connection to the assassination, which had involved three shooters, but place the blame upon E. Howard Hunt, a former CIA officer who had become notorious during Watergate, and scapegoat him as a rogue agent, along with a few other equally tarnished colleagues. Marchetti published the resulting story in *The Spotlight*, a weekly national tabloid newspaper operated by Liberty Lobby, a rightwing populist organization based in DC.

Although almost totally shunned by the mainstream media, *The Spotlight* was then at the peak of its influence, having almost 400,000 subscribers, as large a readership as the combined total of *The New Republic*, *The Nation*, and *National Review*.

Marchetti's article suggested that Hunt had actually been in Dallas during the assassination, resulting in a libel lawsuit with potential damages large enough to bankrupt the publication. Longtime JFK assassination researcher Mark Lane became aware of the situation and volunteered his services to Liberty Lobby, hoping to use the legal proceedings, including the discovery process and subpoena power, as a means of securing additional evidence on the assassination, and after various court rulings and appeals, the case finally came to trial in 1985.



NEW YORK TIMES BESTSELLER
Plausible Denial
Was the CIA Involved in the Assassination of JFK?
Mark Lane
Bestselling Author of Rush to Judgment
"Lane's book proves once and forever that the assassination of President Kennedy is more of a mystery today than when it occurred. His work is not without a trace of that stature we call heroic. Three cheers."
—Norman Mailer

As Lane recounted in his 1991 bestseller, *Plausible Denial*, his strategy generally proved quite successful, not only allowing him to win the jury verdict against Hunt, but also eliciting sworn testimony from a former CIA operative of her personal involvement in the conspiracy along with the names of several other participants, though she

claimed that her role had been strictly peripheral. And although Hunt continued for decades to totally deny any connection with the assassination, near the end of his life he made a series of video-taped interviews in which he admitted that he had indeed been involved in the JFK assassination and named several of the other conspirators, while also maintaining that his own role had been merely peripheral. Hunt's explosive death-bed confession was recounted in a major 2007 *Rolling Stone* article and also heavily analyzed in Talbot's books, especially his second one, but otherwise largely ignored by the media.

Many of these apparent conspirators, drawn from that same loose alliance of groups, had previously been involved in the various U.S. government-backed attempts to assassinate Castro or overthrow his Communist government, and they had developed a bitter hostility towards President Kennedy for what they considered his betrayal during the Bay of Pigs fiasco and afterward. Therefore, there is a natural tendency to regard such animosity as the central factor behind the assassination, a perspective generally followed by Talbot, Douglass, and numerous other writers. They conclude that Kennedy died at the hands of harder-line anti-Communists, outraged over his perceived weakness regarding Cuba, Russia, and Vietnam, sentiments that were certainly widespread within right-wing political circles at the height of the Cold War.

While this framework for the assassination is certainly possible, it is far from certain. One may easily imagine that most of the lower-level participants in the Dallas events were driven by such considerations but that the central figures who organized the plot and set matters into motion had different motives. So long as all the conspirators were agreed on Kennedy's elimination, there was no need for an absolute uniformity of motive. Indeed, men who had long been involved in organized crime or clandestine intelligence operations were surely experienced in operational secrecy, and many of them may not have expected to know the identities, let alone the precise motives, of the men at the very top of the remarkable operation they were undertaking.

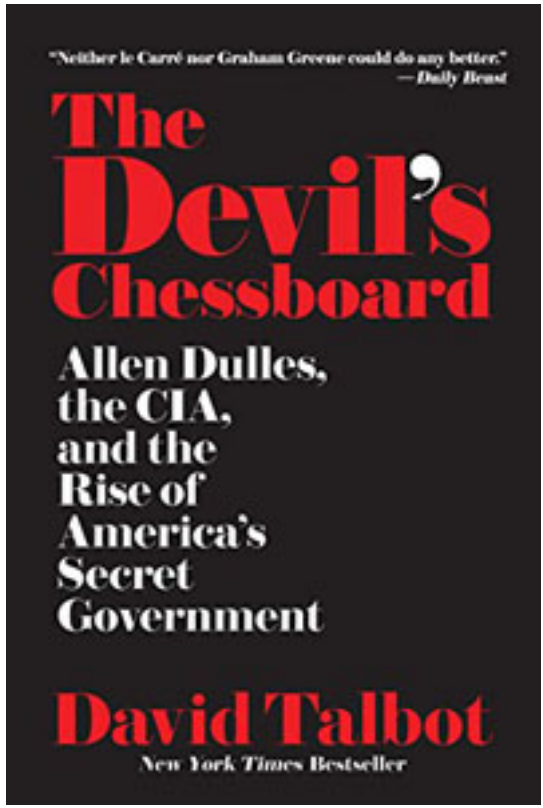
We must also sharply distinguish between the involvement of particular individuals and the involvement of an organization as an organization. For example, CIA Director John McCone was a Kennedy loyalist who had been appointed to clean house a couple of years before the assassination, and he surely was innocent of his patron's death. On the other hand, the very considerable evidence that

numerous individual CIA intelligence officers and operatives participated in the action has naturally raised suspicions that some among their highest-ranking superiors were involved as well, perhaps even as the principal organizers of the conspiracy.

These reasonable speculations may have been magnified by elements of personal bias. Many of the prominent authors who have investigated the JFK assassination in recent years have been staunch liberals, and may have allowed their ideology to cloud their judgment. They often seek to locate the organizers of Kennedy's elimination among those rightwing figures whom they most dislike, even when the case is far from entirely plausible.

But consider the supposed motives of hard-line anti-Communists near the top of the national security hierarchy who supposedly may have organized Kennedy's elimination because he backed away from a full military solution in the Bay of Pigs and Cuban Missile Crisis incidents. Were they really so absolutely sure that a President Johnson would be such an enormous improvement as to risk their lives and public standing to organize a full conspiracy to assassinate an American president?

A new presidential election was less than a year away, and Kennedy's shifting stance on Civil Rights seemed likely to cost him nearly all the Southern states that had provided his margin of electoral victory in 1960. A series of public declarations or embarrassing leaks might have helped remove him from office by traditional political means, possibly replacing him with a Cold War hard-liner such as Barry Goldwater or some other Republican. Would the militarists or business tycoons often implicated by liberal JFK researchers have really been so desperate as to not wait those extra few months and see what happened?



"Neither le Carré nor Graham Greene could do any better."
—Daily Beast
The Devil's Chessboard
Allen Dulles, the CIA, and the Rise of America's Secret Government
David Talbot
New York Times Bestseller

Based on extremely circumstantial evidence, Talbot's 2015 book *The Devil's Chessboard*, something of a sequel to *Brothers*, suggests that former longtime CIA Director Allan Dulles may have been the likely mastermind, with his motive being a mixture of his extreme Cold Warrior views and his personal anger at his 1961 dismissal from his position.

While his involvement is certainly possible, obvious questions arise. Dulles was a seventy-year-old retiree, with a very long and distinguished career of public service and a brother who had served as Eisenhower's secretary of state. He had just published *The Craft of Intelligence*, which was receiving very favorable treatment in the establishment media, and he was embarked on a major book tour. Would he really have risked everything—including his family's reputation in the history books—to organize the murder of America's duly-elected president, an unprecedented act utterly different in nature than trying to unseat a Guatemalan leader on behalf of supposed American national interests? Surely, using his extensive media and intelligence contacts to leak embarrassing disclosures about JFK's notorious sexual escapades during the forthcoming presidential campaign would have been be a much safer means of attempting to

achieve an equivalent result. And the same is true for J. Edgar Hoover and many of the other powerful Washington figures who hated Kennedy for similar reasons.

On the other hand, it is very easy to imagine that such individuals had some awareness of the emerging plot or may even have facilitated it or participated to a limited extent. And once it succeeded, and their personal enemy had been replaced, they surely would have been extremely willing to assist in the cover-up and protect the reputation of the new regime, a role that Dulles may have played as the most influential member of the Warren Commission. But such activities are different than acting as the central organizer of a presidential assassination.

Just as with the hard-line national security establishment, many organized crime leaders had grown outraged over the actions of the Kennedy Administration. In the late 1950s, Robert Kennedy had intensely targeted the mob for prosecution as chief counsel to the Senate Labor Rackets Committee. But during the 1960 election, family patriarch Joseph Kennedy used his own longstanding mafia connections to enlist their support for his older son's presidential campaign, and by all accounts the votes stolen by the corrupt mob-dominated political machines in Chicago and elsewhere helped put JFK in the White House, along with Robert Kennedy as his Attorney General. Frank Sinatra, an enthusiastic Kennedy supporter, had also helped facilitate this arrangement by using his influence with skeptical mob leaders.

However, instead of repaying such crucial election support with political favors, Attorney General Robert Kennedy, perhaps unaware of any such bargain, soon unleashed an all-out war against organized crime, far more serious than anything previously mounted at the federal level, and the crime bosses regarded this as a back-stabbing betrayal by the new administration. Once Joseph Kennedy was felled by an incapacitating stroke in late 1961, they also lost any hope that he would use his influence to enforce the deals he had struck the previous year. FBI wiretaps reveal that mafia leader Sam Giancana decided to have Sinatra killed for his role in this failed bargain, only sparing the singer's life when he considered how much he personally loved the voice of one of the most famous Italian-Americans of the 20th century.

These organized crime leaders and some of their close associates such

as Teamster boss Jimmy Hoffa certainly developed a bitter hatred toward the Kennedys, and this has naturally led some authors to point to the mafia as the likely organizers of the assassination, but I find this quite unlikely. For many decades, American crime bosses had had a complex and varied relationship with political figures, who might sometimes be their allies and at other times their persecutors, and surely there must have been many betrayals over the years. However, I am not aware of a single case in which any even moderately prominent political figure on the national stage was ever targeted for assassination, and it seems quite unlikely that the sole exception would be a popular president, whom they would have likely regarded as being completely out of their league. On the other hand, if individuals who ranked high in Kennedy's own DC political sphere set in motion a plot to eliminate him, they might have found it easy to enlist the enthusiastic cooperation of various mafia leaders.

Furthermore, the strong evidence that many CIA operatives were involved in the conspiracy very much suggests that they were recruited and organized by some figure high in their own hierarchy of the intelligence or political worlds rather than the less likely possibility that they were brought in solely by leaders of the parallel domain of organized crime. And while crime bosses might possibly have organized the assassination itself, they surely had no means of orchestrating the subsequent cover-up by the Warren Commission, nor would there have been any willingness by America's political leadership to protect mafia leaders from investigation and proper punishment for such a heinous act.

If a husband or wife is found murdered, with no obvious suspect or motive at hand, the normal response of the police is to carefully investigate the surviving spouse, and quite often this suspicion proves correct. Similarly, if you read in your newspapers that in some obscure Third World country two bitterly hostile leaders, both having unpronounceable names, had been sharing supreme political power until one was suddenly struck down in a mysterious assassination by unknown conspirators, your thoughts would certainly move in an obvious direction. Most Americans in the early 1960s did not perceive their own country's politics in such a light, but perhaps they were mistaken. As a total newcomer to the enormous, hidden world of JFK conspiracy analysis, I was immediately surprised by the mere sliver of suspicion directed towards Vice President Lyndon B. Johnson, the slain leader's immediate successor and the most obvious beneficiary.

The two Talbot books and the one by Douglass, totaling some 1500 pages, devote merely a few paragraphs to any suspicions of Johnson's involvement. Talbot's first book reports that immediately after the assassination, the vice president had expressed a frantic concern to his personal aides that a military coup might be in progress or a world war breaking out, and suggests that these few casual words demonstrate his obvious innocence, although a more cynical observer might wonder if those remarks had been uttered for exactly that reason. Talbot's second book actually quotes an apparent low-level conspirator as claiming that Johnson had personally signed off on the plot and admits that Hunt believed the same thing, but treats such unsubstantiated accusations with considerable skepticism, before adding a single sentence acknowledging that Johnson may indeed have been a passive supporter or even an accomplice. Douglass and Peter Dale Scott, author of the influential 1993 book *Deep Politics and the Death of JFK*, apparently seem never to have even entertained the possibility.

Ideological considerations are probably an important reason for such remarkable reticence. Although liberals had grown to revile LBJ by the late 1960s for his escalation of the unpopular Vietnam War, over the decades those sentiments have faded, while warm memories of his passage of the landmark Civil Rights legislation and his creation of the Great Society programs have elevated his stature in that ideological camp. Furthermore, such legislation had long been blockaded in Congress and only became law because of the 1964 Democratic Congressional landslide following JFK's martyrdom, and it might be difficult for liberals to admit that their fondest dreams were only realized by an act of political parricide.

Kennedy and Johnson may have been intensely hostile personal rivals, but there seem to have been few deep ideological differences between the two men, and most of the leading figures in JFK's government continued to serve under his successor, surely another source of enormous embarrassment to any ardent liberals who came to suspect that the former had been murdered by a conspiracy involving the latter. Talbot, Douglass, and many other left-leaning advocates for an assassination conspiracy prefer to point the finger of blame towards far more congenial villains such as hard-line, anti-Communist Cold Warriors and right-wing elements, notably including top CIA officials, such as former director Allan Dulles.

An additional factor helping to explain the extreme unwillingness of Talbot, Douglass, and others to consider Johnson as an obvious suspect may be the realities of the book publishing industry. By the

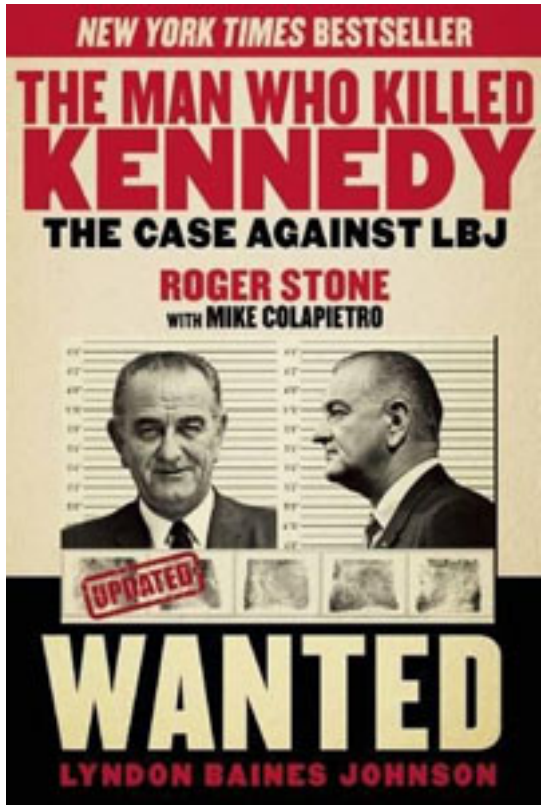
2000s, JFK assassination conspiracies had long become passé and were treated with disdain in mainstream circles. Talbot's strong reputation, his 150 original interviews, and the quality of his manuscript broke that barrier, and attracted *The Free Press* as his very respectable publisher, while later drawing a strongly positive review by a leading academic scholar in the *New York Times Sunday Book Review* and an hour long television segment broadcast on *C-Span Booknotes*. But if he had devoted any space to voicing suspicions that our 35th president had been murdered by our 36th, surely the weight of that extra element of "outrageous conspiracy theory" would have ensured that his book sank without a trace.

However, if we cast off these distorting ideological blinders and the practical considerations of American publishing, the *prima facie* case for Johnson's involvement seems quite compelling.

Consider a very simple point. If a president is struck down by an unknown group of conspirators, his successor would normally have had the strongest possible incentive to track them down lest he might become their next victim. Yet Johnson did nothing, appointing the Warren Commission that covered up the entire matter, laying the blame upon an erratic "lone gunman" conveniently dead. This would seem remarkably odd behavior for an innocent LBJ. This conclusion does not demand that Johnson was the mastermind, nor even an active participant, but it raises a very strong suspicion that he at least had had some awareness of the plot, and enjoyed a good personal relationship with some of the principals.

A similar conclusion is supported by a converse analysis. If the plot succeeded and Johnson became president, the conspirators must surely have felt reasonably confident that they would be protected rather than tracked down and punished as traitors by the new president. Even a fully successful assassination would entail enormous risks unless the organizers believed that Johnson would do exactly what he did, and the only means of ensuring this would be to sound him out about the plan, at least in some vague manner, and obtain his passive acquiesce.

Based on these considerations, it seems extremely difficult to believe that any JFK assassination conspiracy took place entirely without Johnson's foreknowledge, or that he was not a central figure in the subsequent cover-up.

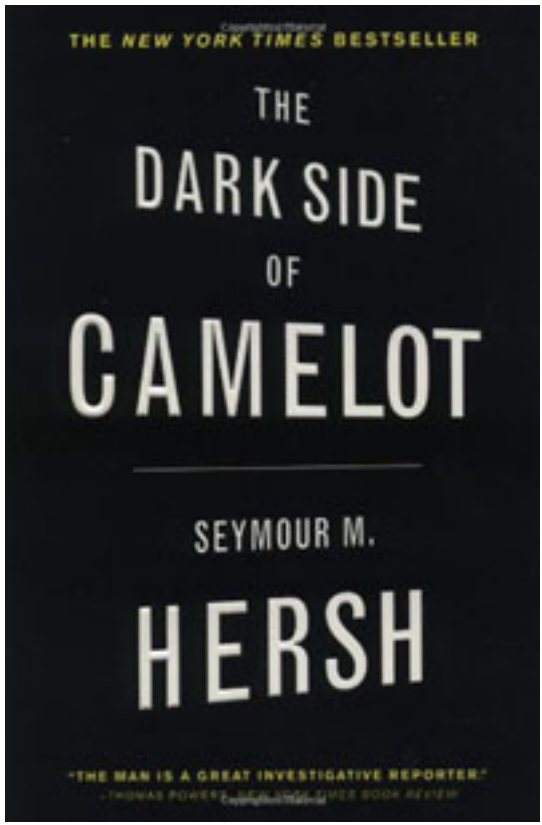


But the specific details of Johnson's career and his political situation in late 1963 greatly strengthen these entirely generic arguments. A very useful corrective to the "See No Evil" approach to Johnson from liberal JFK writers is Roger Stone's *The Man Who Killed Kennedy: The Case Against LBJ*, published in 2013. Stone, a longtime Republican political operative who got his start under Richard Nixon, presents a powerful case that Johnson was the sort of individual who might easily have lent his hand to political murder, and also that he had strong reasons to do so.

Among other things, Stone gathers together an enormous wealth of persuasive information regarding Johnson's decades of extremely corrupt and criminal practices in Texas, including fairly plausible claims that these may have included several murders. In one bizarre 1961 incident that strangely foreshadows the Warren Commission's "lone gunman" finding, a federal government inspector investigating a major Texas corruption scheme involving a close LBJ ally was found dead, shot five times in the chest and abdomen by a rifle, but the death was officially ruled a "suicide" by the local

authorities, and that conclusion was reported with a straight face in the pages of the *Washington Post*.

Certainly one remarkable aspect of Johnson's career is that he was born dirt-poor, held low-paying government jobs throughout his entire life, yet took the oath of office as the wealthiest president in modern American history, having accumulated a personal fortune of over $100 million in present-day dollars, with the financial payoffs from his corporate benefactors having been laundered through his wife's business. This odd anomaly is so little remembered these days that a prominent political journalist expressed total disbelief when I mentioned it to him a decade ago.



Stone also effectively sketches out the very difficult political situation Johnson faced in late 1963. He had originally entered the 1960 presidential race as one of the most powerful Democrats in the country and the obvious front-runner for his party's nomination, certainly compared to the much younger Kennedy, whom he greatly outranked in political stature and also somewhat despised. His defeat, involving a great deal of underhanded dealings on both sides, came as a huge personal blow. The means by which he somehow managed to

get himself placed on the ticket are not entirely clear, but both Stone and Seymour Hersh in *The Dark Side of Camelot* strongly suggest that personal blackmail was a greater factor than geographical ticket-balancing. In any event, Kennedy's paper-thin 1960 victory would have been far more difficult without Texas narrowly falling into the Democratic column, and election fraud there by Johnson's powerful political machine seems almost certainly to have been an important factor.

Under such circumstances, Johnson naturally expected to play a major role in the new administration, and he even issued grandiose demands for a huge political portfolio, but instead he found himself immediately sidelined and treated with complete disdain, soon becoming a forlorn figure with no authority or influence. As time went by, the Kennedys made plans to get rid of him, and just a few days before the assassination, they were already discussing whom to place on the reelection ticket in his stead. Much of Johnson's long record of extreme corruption both in Texas and in DC was coming to light following the fall of Bobby Baker, his key political henchman, and with strong Kennedy encouragement, *Life Magazine* was preparing a huge expose of his sordid and often criminal history, laying the basis for his prosecution and perhaps a lengthy prison sentence. By mid-November 1963, Johnson seemed a desperate political figure at the absolute end of his rope, but a week later he was the president of the United States, and all those swirling scandals were suddenly forgotten. Stone even claims that the huge block of magazine space reserved for the Johnson expose was instead filled by the JFK assassination story.

Aside from effectively documenting Johnson's sordid personal history and the looming destruction he faced at the hands of the Kennedys in late 1963, Stone also adds numerous fascinating pieces of personal testimony, which may or may not be reliable. According to him, as his mentor Nixon was watching the scene at the Dallas police station where Jack Ruby shot Oswald, Nixon immediately turned as white as a ghost, explaining that he had personally known the gunman under his birth-name of Rubenstein. While working on a House Committee in 1947, Nixon had been advised by a close ally and prominent mob-lawyer to hire Ruby as an investigator, being told that "he was one of Lyndon Johnson's boys." Stone also claims that Nixon once emphasized that although he had long sought the presidency, unlike Johnson "I wasn't willing to kill for it." He further reports that Vietnam Ambassador Henry Cabot Lodge and numerous other prominent political figures in DC were absolutely convinced of Johnson's direct involvement in the assassination.

Stone has spent more than a half-century as a ruthless political operative, a position that provided him with unique personal access to individuals who participated in the great events of the past, but one that also carries the less than totally candid reputation of that profession, and individuals must carefully weigh these conflicting factors against each other. Personally, I tend to credit most of the eyewitness stories he provides. But even readers who remain entirely skeptical should find useful the large collection of secondary source references to the sordid details of LBJ's history that the book provides.

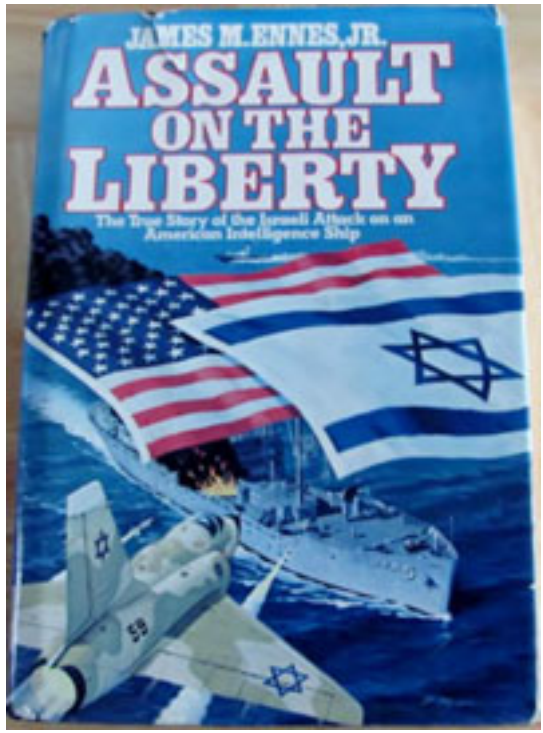
Finally, a seemingly unrelated historical incident had originally raised my own suspicions of Johnson's involvement.

Just prior to the outbreak of the Six Day War in 1967, Johnson had dispatched the *U.S.S. Liberty*, our most advanced intelligence-gathering ship, to remain offshore in international waters and closely monitor the military situation. There have been published claims that he had granted Israel a green-light for its preemptive attack, but fearful of risking a nuclear confrontation with the Soviet patrons of Syria and Egypt, had strictly circumscribed the limits of the military operation, sending the *Liberty* to keep an eye on developments and perhaps also "to show Israel who was boss."

Whether or not this reconstruction is correct, the Israelis soon launched an all-out attack on the nearly defenseless ship despite the large American flag it was flying, deploying attack jets and torpedo boats to sink the vessel during an assault that lasted several hours, while machine-gunning the lifeboats to ensure that there would be no survivors. The first stage of the attack had targeted the main communications antenna, and its destruction together with heavy Israeli jamming prevented any communications with other U.S. naval forces in the region.

Despite these very difficult conditions, a member of the crew heroically managed to jerry-rig a replacement antenna during the attack, and by trying numerous different frequencies was able to evade the jamming and contact the U.S. Sixth Fleet, informing them of the desperate situation. Yet although carrier jets were twice dispatched to rescue the *Liberty* and drive off the attackers, each time they were recalled, apparently upon direct orders from the highest authorities of the U.S. government. Once the Israelis learned that word of the situation had reached other U.S. forces, they soon discontinued their attack, and the heavily-damaged *Liberty* eventually

limped into port, with over 200 dead and wounded sailors and NSA signal operators, representing the greatest loss of American servicemen in any naval incident since World War II.



Although numerous medals were issued to the survivors, word of the incident was totally suppressed by a complete blanket of secrecy, and in an unprecedented step, even a Congressional Medal of Honor was awarded only in a private ceremony. The survivors were also harshly threatened with immediate court martial if they discussed what had transpired with the press or anyone else. Despite the overwhelming evidence that the attack had been intentional, a naval court of inquiry presided over by Admiral John S. McCain, Jr., father of the current senator, whitewashed the incident as a tragic accident, and a complete media blackout suppressed the facts. The true story only began to come out years later, when James M. Ennes, Jr., a *Liberty* survivor, risked severe legal consequences and published *Assault on the Liberty* in 1979.

As it happened, NSA intercepts of Israeli communications between the attacking jets and Tel Aviv, translated from the Hebrew, fully confirmed that the attack had been entirely deliberate, and since many of the dead and wounded were NSA employees, the suppression of these facts greatly rankled their colleagues. My old friend Bill

Odom, the three-star general who ran the NSA for Ronald Reagan, later shrewdly circumvented the restrictions of his political masters by making those incriminating intercepts part of the standard curriculum of the Sigint training program required for all intelligence officers.

In 2007 an unusual set of circumstances finally broke the thirty year blackout in the mainstream media. Real estate investor Sam Zell, a Jewish billionaire extremely devoted to Israel, had orchestrated a leveraged-buyout of the Tribune Company, parent of the *Los Angeles Times* and the *Chicago Tribune*, investing merely a sliver of his own money, with the bulk of the financing coming from the pension funds of the company he was acquiring. Widely heralded as "the grave dancer" for his shrewd financial investments, Zell publicly boasted that the deal gave him nearly all of the upside potential of the company, while he bore relatively little of the risk. Such an approach proved wise since the complex deal quickly collapsed into bankruptcy, and although Zell emerged almost unscathed, the editors and journalists lost decades of their accumulated pension dollars, while massive layoffs soon devastated the newsrooms of what had been two of the country's largest and most prestigious newspapers. Perhaps coincidentally, just as this business turmoil hit in late 2007, the *Tribune* ran a massive 5,500 word story on the *Liberty* attack, representing the first and only time such a comprehensive account of the true facts has ever appeared in the mainstream media.

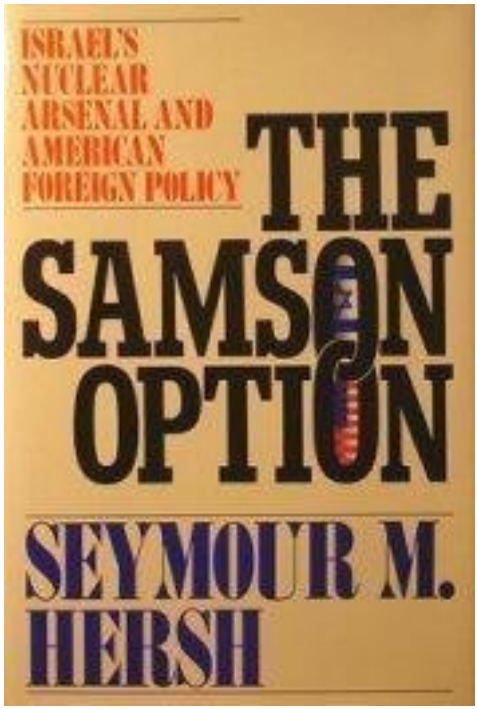
By all accounts, Johnson was an individual of towering personal ego, and when I read the article, I was struck by the extent of his astonishing subservience to the Jewish state. The influence of campaign donations and favorable media coverage seemed completely insufficient to explain his reaction to an incident that had cost the lives of so many American servicemen. I began to wonder if Israel might have played an extraordinarily powerful political trump-card, thereby showing LBJ "who was really boss," and once I discovered the reality of the JFK assassination conspiracy a year or two later, I suspected I knew what that trump-card might have been. Over the years, I had become quite friendly with the late Alexander Cockburn, and the next time we had lunch I outlined my ideas. Although he had always casually dismissed JFK conspiracy theories as total nonsense, he found my hypothesis quite intriguing.

Regardless of such speculation, the strange circumstances of the *Liberty* incident certainly demonstrated the exceptionally close relationship between President Johnson and the government of Israel, as well as the willingness of the mainstream media to spend decades hiding events of the most remarkable nature if they might tread on

particular toes.

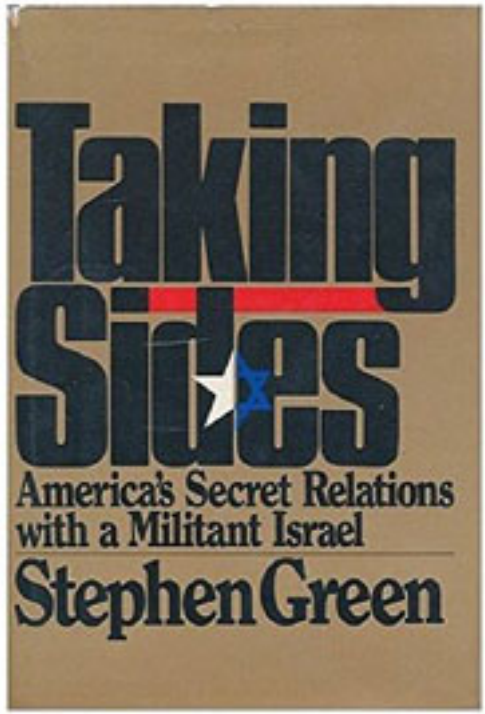
These important considerations should be kept in mind as we begin exploring the most explosive yet under-reported theory of the JFK assassination. Almost twenty-five years ago the late Michael Collins Piper published *Final Judgment* presenting a very large body of circumstantial evidence that Israel and its Mossad secret intelligence service, together with their American collaborators, probably played a central role in the conspiracy.

For decades following the 1963 assassination, virtually no suspicions had ever been directed towards Israel, and as a consequence none of the hundreds or thousands of assassination conspiracy books that appeared during the 1960s, 1970s, and 1980s had hinted at any role for the Mossad, though nearly every other possible culprit, ranging from the Vatican to the Illuminati, came under scrutiny. Kennedy had received over 80% of the Jewish vote in his 1960 election, American Jews featured very prominently in his White House, and he was greatly lionized by Jewish media figures, celebrities, and intellectuals ranging from New York City to Hollywood to the Ivy League. Moreover, individuals with a Jewish background such as Mark Lane and Edward Epstein had been among the leading early proponents of an assassination conspiracy, with their controversial theories championed by influential Jewish cultural celebrities such as Mort Sahl and Norman Mailer. Given that the Kennedy Administration was widely perceived as pro-Israel, there seemed no possible motive for any Mossad involvement, and bizarre, totally unsubstantiated accusations of such a monumental nature directed against the Jewish state were hardly likely to gain much traction in an overwhelmingly pro-Israel publishing industry.



However, in the early 1990s highly-regarded journalists and researchers began exposing the circumstances surrounding the development of Israel's nuclear weapons arsenal. Seymour Hersh's 1991 book *The Samson Option: Israel's Nuclear Arsenal and American Foreign Policy* described the extreme efforts of the Kennedy Administration to force Israel to allow international inspections of its allegedly non-military nuclear reactor at Dimona, and thereby prevent its use in producing nuclear weapons. *Dangerous Liaisons: The Inside Story of the U.S.-Israeli Covert Relationship* by Andrew and Leslie Cockburn appeared in the same year, and covered similar ground.

Although entirely hidden from public awareness at the time, the early 1960s political conflict between the American and Israeli governments over nuclear weapons development had represented a top foreign policy priority of the Kennedy Administration, which had made nuclear non-proliferation one of its central international initiatives. It is notable that John McCone, Kennedy's choice as CIA Director, had previously served on the Atomic Energy Commission under Eisenhower, being the individual who leaked the fact that Israel was building a nuclear reactor to produce plutonium.

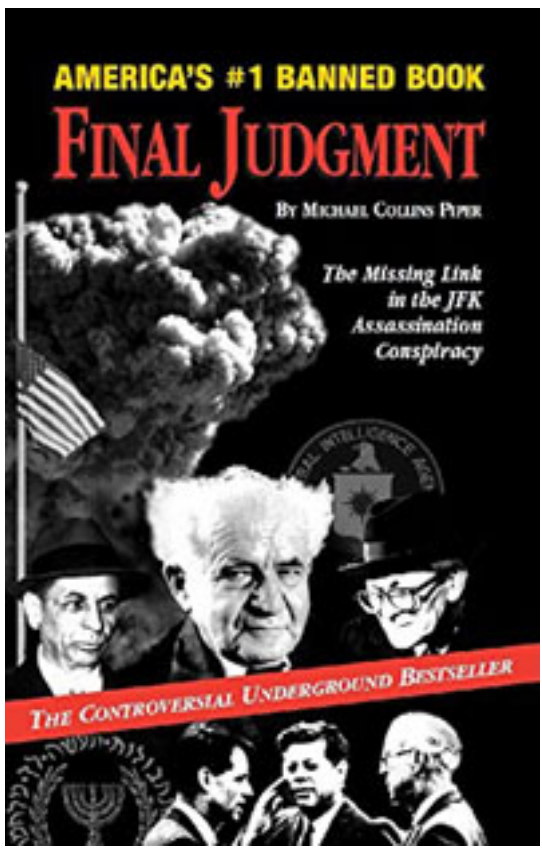


The pressure and financial aid threats secretly applied to Israel by the Kennedy Administration eventually became so severe that they led to the resignation of Israel's founding Prime Minister David Ben-Gurion in June 1963. But all these efforts were almost entirely halted or reversed once Kennedy was replaced by Johnson in November of that same year. Piper notes that Stephen Green's 1984 book *Taking Sides: America's Secret Relations With a Militant Israel* had previously documented that U.S. Middle East Policy completely reversed itself following Kennedy's assassination, but this important finding had attracted little attention at the time.

Skeptics of a plausible institutional basis for a JFK assassination conspiracy have often noted the extreme continuity in both foreign and domestic policies between the Kennedy and Johnson Administrations, arguing that this casts severe doubt on any such possible motive. Although this analysis seems largely correct, America's behavior towards Israel and its nuclear weapons program stands as a very notable exception to this pattern.

An additional major area of concern for Israeli officials may have involved the efforts of the Kennedy Administration to sharply restrict the activities of pro-Israel political lobbies. During his 1960

presidential campaign, Kennedy had met in New York City with a group of wealthy Israel advocates, led by financier Abraham Feinberg, and they had offered enormous financial support in exchange for a controlling influence in Middle Eastern policy. Kennedy managed to fob them off with vague assurances, but he considered the incident so troubling that the next morning he sought out journalist Charles Bartlett, one of his closest friends, and expressed his outrage that American foreign policy might fall under the control of partisans of a foreign power, promising that if he became president, he would rectify that situation. And indeed, once he had installed his brother Robert as Attorney General, the latter initiated a major legal effort to force pro-Israel groups to register themselves as foreign agents, which would have drastically reduced their power and influence. But after JFK's death, this project was quickly abandoned, and as part of the settlement, the leading pro-Israel lobby merely agreed to reconstitute itself as AIPAC.



AMERICA'S #1 BANNED BOOK
FINAL JUDGMENT
By Michael Collins Piper
The Missing Link in the JFK Assassination Conspiracy
The Controversial Underground Bestseller

*Final Judgment* went through a number of a reprintings following its

original 1994 appearance, and by the sixth edition released in 2004, had grown to over 650 pages, including numerous long appendices and over 1100 footnotes, the overwhelming majority of these referencing fully mainstream sources. The body of the text was merely serviceable in organization and polish, reflecting the total boycott by all publishers, mainstream or alternative, but I found the contents themselves remarkable and generally quite compelling. Despite the most extreme blackout by all media outlets, the book sold more than 40,000 copies over the years, making it something of an underground bestseller, and surely bringing it to the attention of everyone in the JFK assassination research community, though apparently almost none of them were willing to mention its existence. I suspect these other writers realized that even any mere acknowledgement of the existence of the book, if only to ridicule or dismiss it, might prove fatal to their media and publishing career. Piper himself died in 2015, aged 54, suffering from the health problems and heavy-drinking often associated with grim poverty, and other journalists may have been reluctant to risk that same dismal fate.

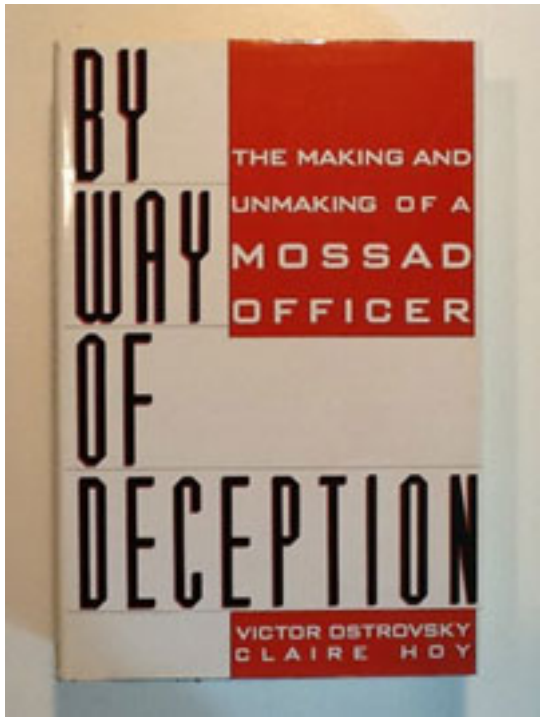
As an example of this strange situation, the bibliography of Talbot's 2007 book contains almost 140 entries, some rather obscure, but has no space for *Final Judgment*, nor does his very comprehensive index include any entry for ﷺ or ﷺ Indeed, at one point he very delicately characterizes Sen. Robert Kennedy's entirely Jewish senior staff by stating ﷺ was not a Catholic among them.ﷺ His 2015 sequel is equally circumspect, and although the index does contain numerous entries pertaining to Jews, all these references are in regards to World War II and the Nazis, including his discussion of the alleged Nazi ties of Allen Dulles, his principal *bête noire*. Stone's book, while fearlessly convicting President Lyndon Johnson of the JFK assassination, also strangely excludes ﷺ and ﷺ from the long index and *Final Judgment* from the bibliography, and Douglass's book follows this same pattern.

Furthermore, the extreme concerns that the Piper Hypothesis seems to have provoked among JFK assassination researchers may explain a strange anomaly. Although Mark Lane was himself of Jewish origins and left-wing roots, after his victory for Liberty Lobby in the Hunt libel trial, he spent many years associated with that organization in a legal capacity, and apparently became quite friendly with Piper, one of its leading writers. According to Piper, Lane told him that *Final Judgment* made ﷺ solid caseﷺ for a major Mossad role in the assassination, and he viewed the theory as fully complementary to his own focus on CIA involvement. I suspect that concerns about these

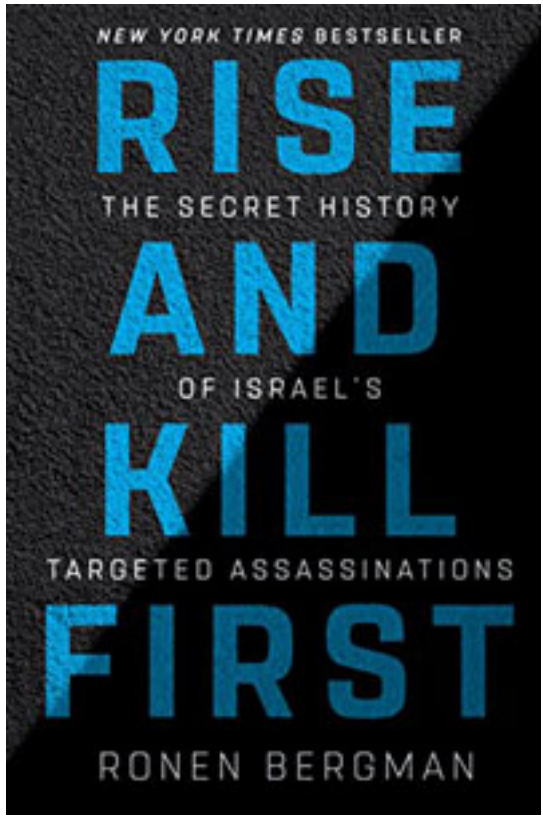
associations may explain why Lane was almost completely airbrushed out of the Douglass and 2007 Talbot books, and discussed in the second Talbot book only when his work was absolutely essential to Talbot's own analysis. By contrast, *New York Times* staff writers are hardly likely to be as well versed in the lesser-known aspects of the JFK assassination research community, and being ignorant of this hidden controversy, they gave Lane the long and glowing obituary that his career fully warranted.

When weighing the possible suspects for a given crime, carefully considering their past patterns of behavior is often a helpful approach. As discussed above, I can think of no historical example in which organized crime initiated a serious assassination attempt against any American political figure even moderately prominent on the national stage. And despite a few suspicions here and there, the same applies to the CIA.

By contrast, the Israeli Mossad and the Zionist groups that preceded the establishment of the Jewish state seem to have had a very long track record of assassinations, including those of high-ranking political figures who might normally be regarded as inviolate. Lord Moyne, the British Minister of State for the Middle East, was assassinated in 1944 and Count Folke Bernadotte, the UN Peace Negotiator sent to help resolve the first Arab-Israel war, suffered the same fate in September 1948. Not even an American president was entirely free of such risks, and Piper notes that the memoirs of Harry Truman's daughter Margaret reveal that Zionist militants had tried to assassinate her father using a letter laced with toxic chemicals in 1947 when they believed he was dragging his heels in supporting Israel, although that failed attempt was never made public. The Zionist faction responsible for all of these incidents was led by Yitzhak Shamir, who later became a leader of Mossad and director of its assassination program during the 1960s, before eventually becoming Prime Minister of Israel in 1986.



If the claims in the 1990s tell-all bestsellers of Mossad defector Victor Ostrovsky can be credited, Israel even considered the assassination of President George H.W. Bush in 1992 for his threats to cut off financial aid to Israel during a conflict over West Bank settlement policies, and I have been informed that the Bush Administration took those reports quite seriously at the time. And although I have not yet read it, the recent, widely-praised book *Rise and Kill First: The Secret History of Israel's Targeted Assassinations* by journalist Ronen Bergman suggests that no other country in the world may have so regularly employed assassination as a standard tool of official state policy.



There are other notable elements that tend to support the Piper Hypothesis. Once we accept the existence of a JFK assassination conspiracy, the one individual who is virtually certain to have been a participant was Jack Ruby, and his organized crime ties were almost entirely to the huge but rarely-mentioned Jewish wing of that enterprise, presided over by Meyer Lansky, an extremely fervent supporter of Israel. Ruby himself had particularly strong connections with Lansky lieutenant Mickey Cohen, who dominated the Los Angeles underworld and had been personally involved in gun-running to Israel prior to the 1948 war. Indeed, according to Dallas rabbi Hillel Silverman, Ruby had privately explained his killing of Oswald by saying "I did it for the Jewish people."

An intriguing aspect to Oliver Stone's landmark *JFK* film should also be mentioned. Arnon Milchan, the wealthy Hollywood producer who backed the project, was not only an Israeli citizen, but had also reportedly played a central role in the enormous espionage project to divert American technology and materials to Israel's nuclear weapons project, the exact undertaking that the Kennedy Administration had made such efforts to block. Milchan has even sometimes been

described as ﷺthe Israeli James Bond.ﷺ  And although the film ran a full three hours in length, *JFK* scrupulously avoided presenting any of the details that Piper later regarded as initial clues to an Israeli dimension, instead seeming to finger America's fanatic home-grown anti-Communist movement and the Cold War leadership of the military-industrial complex as the guilty parties.

Summarizing over 300,000 words of Piper's history and analysis in just a few paragraphs is obviously an impossible undertaking, but the above discussion provides a reasonable taste of the enormous mass of circumstantial evidence mustered in favor of the Piper Hypothesis.

In many respects, JFK Assassination Studies has become its own academic discipline, and my credentials are quite limited.  I have read perhaps a dozen books in the subject, and have also tried to approach the issues with the clean slate and fresh eyes of an outsider, but any serious expert would surely have digested scores or even hundreds of the volumes in the field.  While the overall analysis of *Final Judgment* struck me as quite persuasive, a good fraction of the names and references were unfamiliar, and I simply do not have the background to assess their credibility, nor whether the description of the material presented is accurate.

Under normal circumstances, I would turn to the reviews or critiques produced by other authors, and after comparing them against Piper's claims, decide which argument seemed the stronger. But although *Final Judgment* was published a quarter-century ago, the near-absolute blanket of silence surrounding the Piper Hypothesis, especially from the more influential and credible researchers, renders this impossible.

However, Piper's inability to secure any regular publisher and the widespread efforts to smother his theory out of existence, have had an ironic consequence.  Since the book went out of print years ago, I had a relatively easy time securing the rights to include it in my collection of controversial HTML Books, and I have now done so, thereby allowing everyone on the Internet to conveniently read the entire text and decide for themselves, while easily checking the multitude of references or searching for particular words or phrases.

- Final Judgment
  *The Missing Link in the JFK Assassination Conspiracy*
  Michael Collins Piper • 2005 • 310,000 Words

This edition actually incorporates several much shorter works, originally published separately. One of these, consisting of an extended Q&A, describes the genesis of the idea and answers numerous questions surrounding it, and for some readers might represent a better starting point.

- Default Judgment
  *Questions, Answers & Reflections About the Crime of the Century*
  Michael Collins Piper • 2005 • 48,000 Words

There are also numerous extended Piper interviews or presentations easily available on YouTube, and when I watched two or three of them a couple of years ago, I thought he effectively summarized many of his main arguments, but I cannot remember which ones they were.

The Kennedy assassination surely ranks as one of the most dramatic and heavily reported events of the twentieth century, yet the overwhelming evidence that our president died at the hands of a conspiracy rather than an eccentric "lone gunman" was almost entirely suppressed by our mainstream media during the decades that followed, with endless ridicule and opprobrium heaped on many of the stubborn truth-tellers. Indeed, the very term "conspiracy theory" soon became a standard slur aimed against all those who sharply questioned establishmentarian narratives, and there is strong evidence that such pejorative use was deliberately promoted by government agencies concerned that so much of the American citizenry was growing skeptical of the implausible cover story presented by the Warren Commission. But despite all these efforts, the period may mark the inflection point at which public trust in our national media began its precipitous decline. Once an individual concludes that the media lied about something as monumental as the JFK assassination, he naturally begins to wonder what other lies may also be out there.

Although I now consider the case for an assassination conspiracy overwhelming, I think that the passage of so many decades has removed any real hope of reaching a firm conclusion about the identities of the main organizers or their motives. Those who disagree with this negative assessment are free to continue sifting the enormous mountain of complex historical evidence and debating their conclusions with others having similar interests.

However, among the cast of major suspects, I think that the most

likely participant by far was Lyndon Johnson, based on any reasonable assessment of means, motive, and opportunity, as well as the enormous role he obviously must have played in facilitating the subsequent Warren Commission cover-up. Yet although such an obvious suspect must surely have been immediately apparent to any observer, Johnson seems to have received only a rather thin slice of the attention that books regularly directed to other, far less plausible suspects. So the clear dishonesty of the mainstream media in avoiding any recognition of a conspiracy seems matched by a second layer of dishonesty in the alternative media, which has done its best to avoid recognizing the most likely perpetrator.

And the third layer of media dishonesty is the the most extreme of all. A quarter century ago, *Final Judgment* provided an enormous mass of circumstantial evidence suggesting a major, even dominant, role for the Israeli Mossad in organizing the elimination of both our 35rd president and also his younger brother, a scenario that seems second in likelihood only to that of Johnson's involvement. Yet Piper's hundreds of thousands of words of analysis have seemingly vanished into the ether, with very few of the major conspiracy researchers even willing to admit their awareness of a shocking book that sold over 40,000 copies, almost entirely by underground word-of-mouth.

So although committed partisans can continue endless, largely fruitless debates over ﷺWho Killed JFK,ﷺ I think that the one firm conclusion we can draw from the remarkable history of this pivotal event of the twentieth century is that all of us have lived for many decades within the synthetic reality of ﷺOur American Pravda.ﷺ

# Our Deadly World of Post-War Politics

July 2, 2018 • 5,700 Words

Although my main academic focus was theoretical physics, I always had a very strong interest in history as well, especially that of the Classical Era. Trying to extract the true pattern of events from a collection of source material that was often fragmentary, unreliable, and contradictory was a challenging intellectual exercise, testing my analytical ability. I believe I even contributed meaningfully to the field, including a short 1985 article in *The Journal of Hellenic Studies* that sifted the ancient sources to conclude that Alexander the Great had younger brothers whom he murdered when he came to the throne.

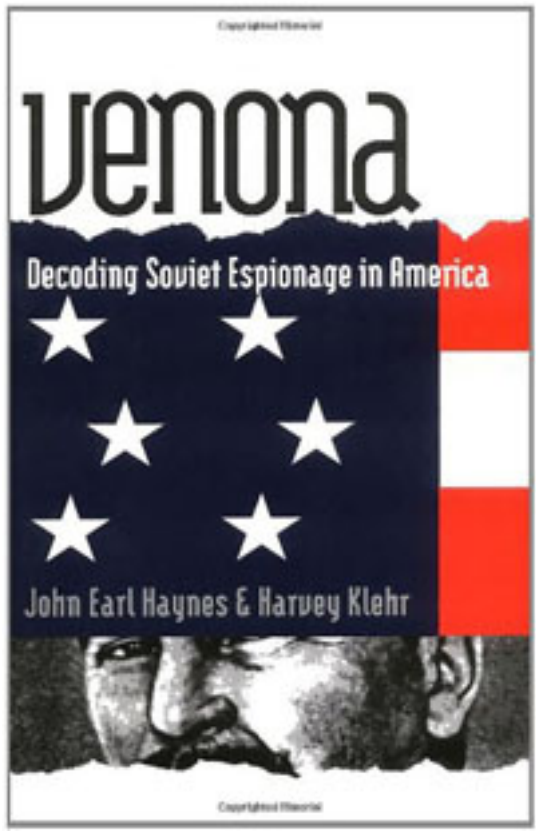
However, I never had any interest in 20th century American history. For one thing, it seemed so apparent to me that all the basic political facts were already well known and conveniently provided in the pages of my introductory history textbooks, thereby leaving little room for any original research, except in the most obscure corners of the field.

Also, the politics of ancient times was often colorful and exciting, with Hellenistic and Roman rulers so frequently deposed by palace coups, or falling victim to assassinations, poisonings, or other untimely deaths of a highly suspicious nature. By contrast, American political history was remarkably bland and boring, lacking any such extra constitutional events to give it spice. The most dramatic political upheaval of my own lifetime had been the forced resignation of President Richard Nixon under threat of impeachment, and the causes of his departure from office—some petty abuses of power and a subsequent cover-up—were so clearly inconsequential that they fully affirmed the strength of our American democracy and the scrupulous care with which our watchdog media policed the misdeeds of even the most powerful.

In hindsight perhaps I should have asked myself whether the coups and poisonings of Roman Imperial times were accurately reported in their own day, or if most of the toga-wearing citizens of that era might have remained blissfully unaware of the nefarious events secretly determining the governance of their own society.

Since my knowledge of American history ran no deeper than my basic textbooks and mainstream newspapers and magazines, the last decade or so has been a journey of discovery for me, and often a shocking one. I came of age many years after the Communist spy scares of the 1950s had faded into dim memory, and based on what I read, I always thought the whole matter more amusing than anything else. It seemed that about the only significant Red ever caught, who may or may not have been innocent, was some obscure individual bearing the unlikely name of Alger Hiss, and as late as the 1980s, his children still fiercely proclaimed his complete innocence in the pages of the *New York Times*. Although I thought he was probably guilty, it also seemed clear that the methods adopted by his persecutors such as Joseph McCarthy and Richard Nixon had actually done far more damage to our country during the unfortunate era named for the former figure.

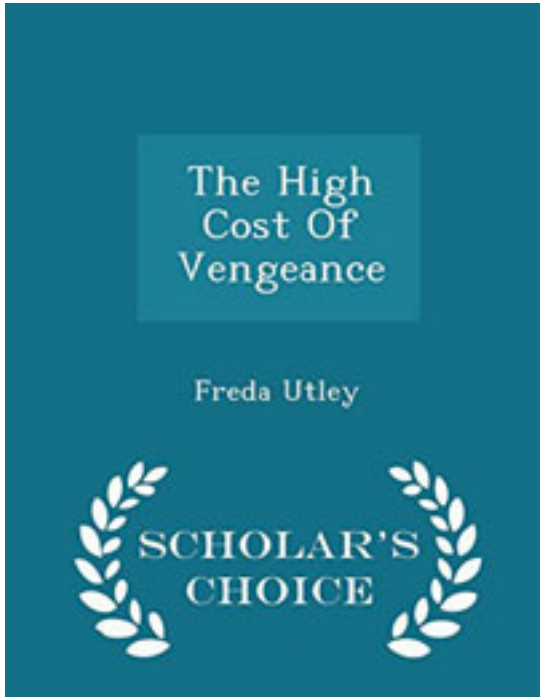
During the 1990s, I occasionally read reviews of new books based on the Venona Papers—decrypted Soviet cables finally declassified—and they seemed to suggest that the Communist spy ring had both been real and far more extensive than I had imagined. But those events of a half-century earlier were hardly uppermost in my mind, and anyway other historians still fought a rear-guard battle in the newspapers, arguing that many of the Venona texts were fraudulent. So I gave the matter little thought.



Only in the last dozen years, as my content-archiving project made me aware of the 1940s purge of some of America's most prominent public intellectuals, and I began considering their books and articles, did I begin to realize the massive import of the Soviet cables. I soon read three or four of the Venona books and was very impressed by their objective and meticulous scholarly analysis, which convinced me of their conclusions. And the implications were quite remarkable, actually far understated in most of the articles that I had read.

Consider, for example, the name Harry Dexter White, surely unknown to all but the thinnest sliver of present-day Americans, and proven by the Venona Papers to have been a Soviet agent. During the 1940s, his official position was merely one of several assistant secretaries of the Treasury, serving under Henry Morgenthau, Jr., an influential member of Franklin Roosevelt's cabinet. But Morgenthau was actually a gentleman-farmer, almost entirely ignorant of finance, who had gotten his position partly by being FDR's neighbor, and according to numerous sources, White actually ran the Treasury Department under his titular authority. Thus, in 1944 it was White who negotiated with John Maynard Keynes—Britain's most towering economist—to lay the

basis for the the Bretton Woods Agreement, the IMF, and the rest of the West's post-war economic institutions.



Moreover, by the end of the war, White had managed to extend the power of the Treasury—and therefore his own area of control—deep into what would normally be handled by the Department of State, especially regarding policies pertaining to the defeated German foe. His handiwork notably included the infamous ﷺMorgenthau Plan,ﷺ proposing the complete dismantling of the huge industrial base at the heart of Europe, and its conversion into an agricultural region, automatically implying the elimination of most of Germany's population, whether by starvation or exodus. And although that proposal was officially abandoned under massive protest by the allied leadership, books by many post-war observers such as Freda Utley have argued that it was partially implemented in actuality, with millions of German civilians perishing from hunger, sickness, and other consequences of extreme deprivation.

At the time, some observers believed that White's attempt to eradicate much of prostrate Germany's surviving population was vindictively motivated by his own Jewish background. But William Henry Chamberlin, long one of America's most highly-regarded foreign policy journalists, strongly suspected that the plan was a deeply cynical one, intended to inflict such enormous misery upon those

Germans living under Western occupation that popular sentiment would automatically shift in a strongly pro-Soviet direction, allowing Stalin to gain the upper hand in Central Europe, and many subsequent historians have come to similar conclusions.

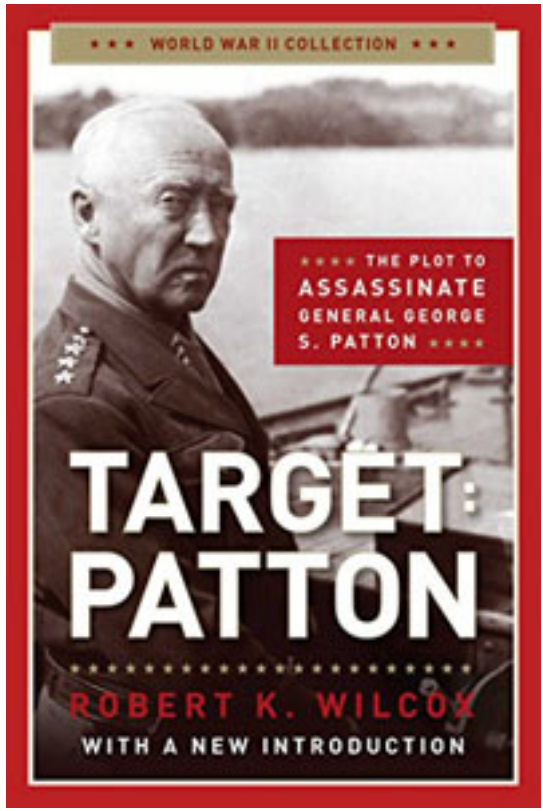
Even more remarkably, White managed to have a full set of the plates used to print Allied occupation currency shipped to the Soviets, allowing them to produce an unlimited quantity of paper marks recognized as valid by Western governments, thus allowing the USSR to finance its post-war occupation of half of Europe on the backs of the American taxpayer.

Eventually suspicion of White's true loyalties led to his abrupt resignation as the first U.S. Director of the IMF in 1947, and in 1948 he was called to testify before the House Un-American Activities Committee. Although he denied all accusations, he was scheduled for additional testimony, with the intent of eventually prosecuting him for perjury and then using the threat of a long prison sentence to force him to reveal the other members of his espionage network. However, almost immediately after his initial meeting with the Committee, he supposedly suffered a couple of sudden heart attacks and died at age 55, though apparently no direct autopsy was performed on his corpse.

Soon afterward other Soviet spies also began departing this world at unripe ages within a short period of time. Two months after White's demise, accused Soviet spy W. Marvin Smith was found dead at age 53 in the stairwell of the Justice building, having fallen five stories, and sixty days after that, Laurence Duggan, another agent of very considerable importance, lost his life at age 43 following a fall from the 16th floor of an office building in New York City. So many other untimely deaths of individuals of a similar background occurred during this general period that in 1951 the staunchly right-wing *Chicago Tribune* ran an entire article noting this rather suspicious pattern. But while I don't doubt that the plentiful anti-Communist activists of that period exchanged dark interpretations of so many coincidental fatalities, I am not aware that such "conspiracy theories" were ever taken seriously by the more respectable mainstream media, and certainly no hint of this reached any of the standard history textbooks that constituted my primary knowledge of that period.

Sometimes rank newcomers to a given field will notice patterns less apparent to those long familiar with the topic, more easily discerning

the forest amid the trees. My own very superficial knowledge of 20th century American history burdened me with fewer preconceived notions of the pattern of those times, and the substantial body-count of accused Soviet spies during the late 1940s gradually made me wonder about other sudden fatalities during that same era.

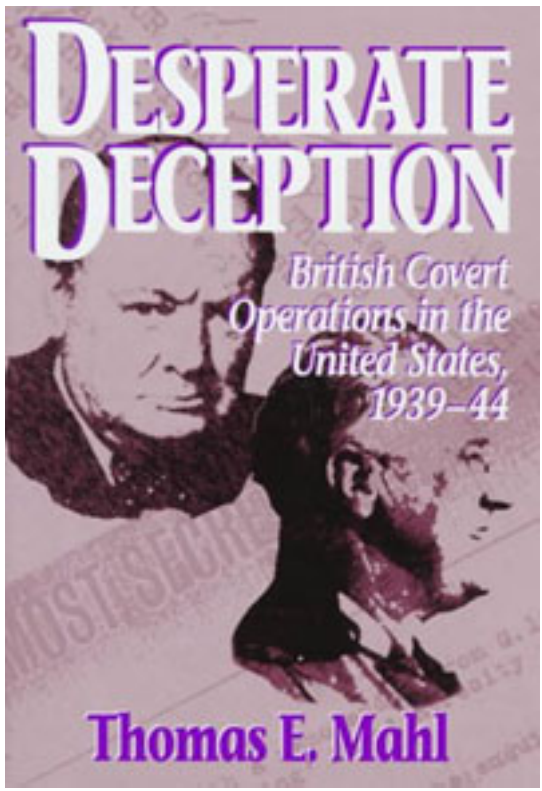


WORLD WAR II COLLECTION
THE PLOT TO ASSASSINATE GENERAL GEORGE S. PATTON
TARGET: PATTON
ROBERT K. WILCOX
WITH A NEW INTRODUCTION

As an example, I came across *Target Patton* by Robert K. Wilcox, which provided some very strong evidence that the 1948 fatal car crash that claimed the life of Gen. George S. Patton was not accidental, but was instead an assassination by America's own OSS, forerunner of the CIA, then heavily infiltrated by Soviet agents. Unlike the above deaths, which were merely highly suspicious in their timing and concentrated sequence, in the case of Patton the evidence was considerably stronger, even including the eventual public confession decades later of the OSS assassin responsible, with his claims supported by the contents of his personal diary.

At the time of his death, Patton was America's highest-ranking military officer stationed on the European continent and certainly one of our most famous war-heroes. But he had bitterly clashed with his civilian and military superiors over American policy towards the

Soviets, whom he viewed with intense hostility. He died the day before he was scheduled to return home to America, there planning to resign his commission and begin a major national speaking-tour denouncing our political leadership and demanding a military confrontation with the USSR. Prior to stumbling across the book in question, which had been totally ignored by the entire American media, I had never encountered a hint of anything untoward regarding Patton's death, nor had I been aware of the political plans he had formulated prior to his sudden fatal accident.



Once a possible pattern has been observed, accumulating additional pieces becomes a much more natural process. A year or so after encountering the strongly substantiated claims of Patton's assassination, I happened to read *Desperate Deception* by Thomas E. Mahl, a mainstream historian, whose book was released by a specialized military affairs publishing house. This fascinating account documented the long-hidden early 1940s campaign by British intelligence agents to remove all domestic political obstacles to America's entry into World War II. A crucial aspect of that project involved the successful attempt to manipulate the Republican Convention of 1940 into selecting as its presidential standard-bearer

an obscure individual named Wendell Wilkie, who had never previously held political office and moreover had been a committed lifelong Democrat. Wilkie's great value was that he shared Roosevelt's support for military intervention in the ongoing European conflict, though this was contrary to virtually the entire base of his own newly-joined party. Ensuring that both presidential candidates shared those similar positions prevented the race from becoming an referendum on that issue, in which up to 80% of the American public seems to have been on the other side.

Wilkie's nomination was surely one of the strangest occurrences in American political history, and the path to his improbable nomination was paved by quite a number of odd and suspicious events, most notably the extremely fortuitous sudden collapse and death of the Republican convention manager, a key Wilkie opponent, which Mahl regards as highly suspicious.

Wilkie went on to suffer a landslide defeat at Roosevelt's hands in November, but quickly reconciled with his erstwhile opponent, and was sent abroad on a number of important political missions. Future historians would surely have been fascinated to learn some of the internal details of how British intelligence operatives had managed to "parachute" an obscure lifelong Democrat into leading the top of the Republican ticket in 1940, thereby fatefully ensuring American entry into World War II. But unfortunately all of Wilkie's personal knowledge of such momentous events was forever lost to posterity when he suddenly took ill and died of a heart attack—or according to Wikipedia 15 consecutive heart attacks—on October 8, 1944 at the age of 52.

One of the most powerful political figures of Roosevelt's dozen years in office was his close aide Harry Hopkins, who actually moved into the White House in 1940 and remained a permanent resident for nearly the next four years. Although Hopkins hardly bore an exalted title, being an administrator of various New Deal programs and later serving as Commerce Secretary, he was frequently referred to as "the Deputy President" and certainly carried more weight than any of FDR's vice presidents or Cabinet members, generally being regarded as the second most powerful political figure in the country.

Hopkins, a former social worker and political activist, was decidedly on the left, having his roots in a New York City progressive tradition that shaded into socialism, while being very strongly pro-Soviet in his foreign policy views. There are some indications in the Venona Papers that he may even have actually been a Soviet agent, and

Herbert Romerstein and Eric Breindel took that position in their book *The Venona Secrets*, but John Earl Haynes and Harvey Klehr, the leading Venona scholars, doubted this likelihood based on technical arguments.

In the last year or so of Roosevelt's life, his relations with Hopkins had frayed, and when FDR died in April 1945, thereby elevating Harry S. Truman to the presidency, Hopkins' remaining influence disappeared. Having spent so many years at the absolute center of American power, Hopkins planned to publish his personal memoirs of the momentous events he had witnessed during the years of the Great Depression and the Second World War, but he suddenly took ill and died in early 1946, age 55, surviving his longtime political partner FDR by only eight months. According to the authoritative references provided in his Wikipedia entry, the cause of death was stomach cancer. Or malnutrition related to digestive problems. Or liver failure due to hepatitis or cirrhosis. Or perhaps hemochromatosis. Although Hopkins had been in poor health for many years, questions do arise when the death of America's second most powerful political figure is ascribed to such a wide variety of somewhat different causes.

The particular timing of events may sometimes exert a outsize influence on historical trajectories. Consider the figure of Henry Wallace, probably still dimly remembered as a leading leftwing Democrat of the 1930s and 1940s. Wallace had been something of a Midwestern wonder-boy in farming innovation and was brought into FDR's first Cabinet in 1933 as Secretary of Agriculture. By all accounts, Wallace was an absolutely 100% true-blue American patriot, with no hint of any nefarious activity appearing anywhere in the Venona Papers. But as is sometimes the case with technical experts, he seems to have been remarkably naive outside his main field of knowledge, notably in his extreme religious mysticism and more importantly in his politics, with many of those closest to him being proven Soviet agents, who presumably regarded him as the ideal front-man for their own political intrigues.

From George Washington onward, no American president had ever run for a third consecutive term, and when FDR suddenly decided to take this step during 1940, partly using the ongoing war in Europe as an excuse, many prominent figures in the Democratic Party launched a political rebellion, notably including his own two-time Vice President John Nance Garner, who had been a former Democratic Speaker of the House, and James Farley, the powerful party leader

who had originally helped elevate Roosevelt to the presidency. FDR selected Wallace as his third-term Vice President, perhaps as a means of gaining support from the powerful pro-Soviet faction among the Democrats. But as a consequence, even as FDR's health steadily deteriorated during the four years that followed, an individual whose most trusted advisors were agents of Stalin remained just a heartbeat away from the American presidency.

Under the strong pressure of Democratic Party leaders, Wallace was replaced on the ticket at the July 1944 Democratic Convention, and Harry S. Truman succeeded to the presidency when FDR died in April of the following year. But if Wallace had not been replaced or if Roosevelt had died a year earlier, the consequences for the country would surely have been enormous. According to later statements, a Wallace Administration would have included Laurence Duggan as Secretary of State, Harry Dexter White at the helm of the Treasury, and presumably various other outright Soviet agents occupying all the key nodes at the top of the American federal government. One might jokingly speculate whether the Rosenbergs—later executed for treason—would have been placed in charge of our nuclear weapons development program.

As it happens, Roosevelt lived until 1945, and instead of running the American government on behalf of Stalin, Dugan and White both died quite suddenly within a few months of each other after they came under suspicion in 1948. But the tendrils of Soviet control during the early 1940s ran remarkably deep.

As a striking example, Soviet agents became aware of the Venona decryption project in 1944, and soon afterward a directive came down from the White House ordering the project abandoned and the records of Soviet espionage destroyed. The only reason that Venona survived, allowing us to later reconstruct the fateful politics of that era, was that the military officer in charge risked a court-martial by simply ignoring that explicit Presidential order.

In the wake of the Venona Papers, publicly released a quarter century ago and today accepted by almost everyone, it seems undeniable that during the early 1940s America's national government came within a hairsbreadth—or rather a heartbeat—of falling under the control of a tight network of Soviet agents. Yet I have only very rarely seen this simple fact emphasized in any book or article, even though this surely helps explain the ideological roots of the anti-Communist paranoia that became such a powerful political force by the early 1950s.

Obviously, Communism had very shallow roots in American society, and any Soviet-dominated Wallace Administration established in 1943 or 1944 probably would sooner or later have been swept from power, perhaps by America's first military coup. But given FDR's fragile health, this momentous possibility should certainly be regularly mentioned in discussions of that era.

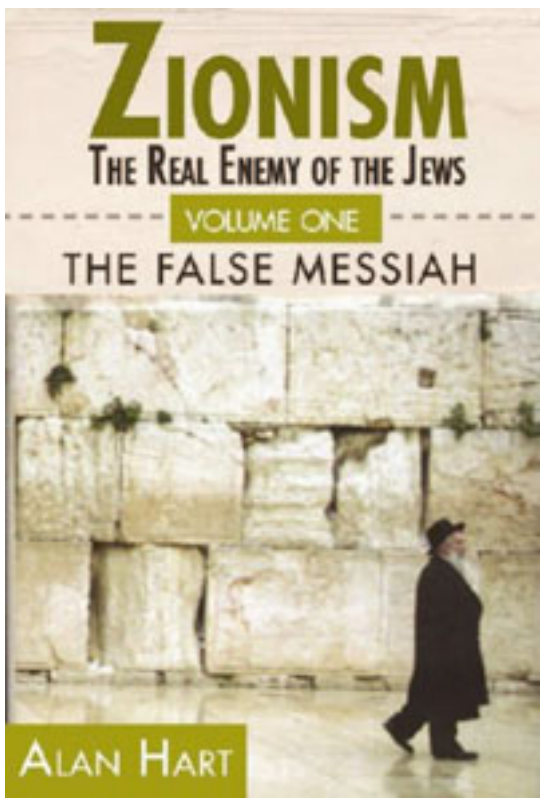
If important historical matters are excluded from the media, a younger generation of scholars may never encounter them, and the historiography they eventually produce with the best of intentions may contain enormous lacunae. Consider, for example, the prize-winning volumes of political history that Rick Perlstein has written since 2001, tracing the rise of American conservatism from the pre-Goldwater era up to the rise of Reagan in the 1970s. The series has justly earned widespread acclaim for its enormous attention to detail, but according to the indexes, the combined total of nearly 2,400 pages contains merely two glancing and totally dismissive mentions of Harry Dexter White at the very beginning of the first volume, and no entry whatsoever for Laurence Duggan, or even more shockingly, "Venona." I've sometimes joked that writing a history of post-war American conservatism without focusing on such crucial elements is like writing a history of America's involvement in World War II without mentioning Pearl Harbor.

Sometimes our standard history textbooks provide two seemingly unrelated stories, which become far more important only once we discover that they are actually parts of a single connected whole. The strange death of James Forrestal certainly falls into this category.

During the 1930s Forrestal had reached the pinacle of Wall Street, serving as CEO of Dillon, Read, one of the most prestigious investment banks. With World War II looming, Roosevelt drew him into government service in 1940, partly because his strong Republican credentials helped emphasize the bipartisan nature of the war effort, and he soon became Undersecretary of the Navy. Upon the death of his elderly superior in 1944, Forrestal was elevated to the Cabinet as Navy Secretary, and after the contentious battle over the reorganization of our military departments, he became America's first Secretary of Defense in 1947, holding authority over the Army, Navy, Air Force, and Marines. Along with Secretary of State Gen. George Marshall, Forrestal probably ranked as the most influential member of Truman's Cabinet. However, just a few months after Truman's 1948 reelection, we are told that Forrestal became paranoid and depressed,

resigned his powerful position, and weeks later committed suicide by jumping from an 18th story window at Bethesda Naval Hospital. Knowing almost nothing about Forrestal or his background, I always nodded my head over this odd historical event.

Meanwhile, an entirely different page or chapter of my history textbooks usually carried the dramatic story of the bitter political conflict that wracked the Truman Administration over the recognition of the State of Israel, which had taken place the previous year. I read that George Marshall argued such a step would be totally disastrous for American interests by potentially alienating many hundreds of millions of Arabs and Muslims, who held the enormous oil wealth of the Middle East, and felt so strongly about the matter that he threatened to resign. However, Truman, heavily influenced by the personal lobbying of his old Jewish haberdashery business partner Eddie Jacobson, ultimately decided upon recognition, and Marshall stayed in the government.



Then almost a decade ago, I somehow stumbled across an interesting book by Alan Hart, a journalist and author who had served as a longtime BBC Middle East Correspondent, discovering that these two

different stories were part of a seamless whole. By Hart's account, although Marshall had indeed strongly opposed recognition of Israel, Forrestal had actually led the fight in Truman's Cabinet and was most identified with that position, which resulted in numerous harsh attacks in the media and his later departure from the Truman Cabinet. The author also raised very considerable doubts about whether Forrestal's subsequent death had actually been suicide, citing an obscure website for a detailed analysis of that last issue.

It is a commonplace that the Internet has democratized the distribution of information, allowing those who create knowledge to connect with those who consume it without the need for a gate-keeping intermediary. I have encountered few better examples of the unleashed potential of this new system than "Who Killed Forrestal?", an exhaustive analysis by a certain David Martin, who describes himself as an economist and political blogger. Running many tens of thousands of words, his series of articles on the fate of America's first Secretary of Defense provides an exhaustive discussion of all the source materials, including the small handful of published books describing Forrestal's life and strange death, supplemented by contemporaneous newspaper articles and numerous relevant government documents obtained by personal FOIA requests. The verdict of murder followed by a massive governmental cover-up seems solidly established.

As mentioned, Forrestal's role as the Truman Administration's principal opponent of Israel's creation had made him the subject of an almost unprecedented campaign of personal media vilification in both print and radio, spearheaded by the country's two most powerful columnists of the right and the left, Walter Winchell and Drew Pearson, only the former being Jewish, but both heavily connected with the ADL and extremely pro-Zionist, with their attacks and accusations even continuing after his resignation and death.

Once we move past the wild exaggerations of Forrestal's alleged psychological problems promoted by these very hostile media pundits and their many allies, much of Forrestal's supposed paranoia apparently consisted of his belief that he was being followed around Washington, D.C., his phones may have been tapped, and his life might be in danger at the hands of Zionist agents. And perhaps such concerns were not so entirely unreasonable given certain contemporaneous events.

Lord Moyne, the British Secretary for the Middle East, had been assassinated in 1944 and UN Middle East Peace Negotiator Count

Folke Bernadotte had suffered the same fate in 1948. Declassified British documents eventually revealed an assassination plot against Foreign Secretary Ernest Bevin that same year, and Margaret Truman's memoirs mention a failed assassination attempt against her own father in 1947. Zionist factions were responsible for all of these incidents. Indeed, State Department official Robert Lovett, a relatively minor and low-profile opponent of Zionist interests, reported receiving numerous threatening phone calls late at night around the same time, which greatly concerned him. Martin also cites subsequent books by Zionist partisans who boasted of the effective use their side had made of blackmail, apparently obtained by wire-tapping, to ensure sufficient political support for Israel's creation.

Meanwhile, behind the scenes, powerful financial forces may have been gathering to ensure that President Truman ignored the unified recommendations of all his diplomatic and national security advisors. Years later, both Gore Vidal and Alexander Cockburn would separately report that it eventually became common knowledge in DC political circles that during the desperate days of Truman's underdog 1948 reelection campaign, he had secretly accepted a cash payment of $2 million from wealthy Zionists in exchange for recognizing Israel, a sum perhaps comparable to $20 million or more in present-day dollars.

Republican Thomas Dewey had been heavily favored to win the 1948 presidential election, and after Truman's surprising upset, Forrestal's political position was certainly not helped when Pearson claimed in a newspaper column that Forrestal had secretly met with Dewey during the campaign, making arrangements to be kept on in a Dewey Administration.

Suffering political defeat regarding Middle East policy and facing ceaseless media attacks, Forrestal resigned his Cabinet post under pressure. Almost immediately afterwards, he was checked into the Bethesda Naval Hospital for observation, supposedly suffering from severe fatigue and exhaustion, and he remained there for seven weeks, with his access to visitors sharply restricted. He was finally scheduled to be released on May 22, 1949, but just hours before his brother Henry came to pick him up, his body was found below the window of his 18th floor room, with a knotted cord wound tightly around his neck. Based upon an official press release, the newspapers all reported his unfortunate suicide, suggesting that he had first tried to hang himself, but failing that approach, had leapt out his window instead. A half page of copied Greek verse was found in his room, and in the heydey of Freudian psychoanalyical thinking, this was regarded

as the subconscious trigger for his sudden death impulse, being treated as almost the equivalent of an actual suicide note. My own history textbooks simplified this complex story to merely say "suicide," which is what I read and never questioned.

Martin raises numerous very serious doubts with this official verdict. Among other things, published interviews with Forrestal's surviving brother and friends reveal that none of them believed Forrestal had taken his own life, and that they had all been prevented from seeing him until near the very end of his entire period of confinement. Indeed, the brother recounted that just the day before, Forrestal had been in fine spirits, saying that upon his release, he planned to use some of his very considerable personal wealth to buy a newspaper and begin revealing to the American people many of the suppressed facts concerning America's entry into World War II, of which he had direct knowledge, supplemented by the extremely extensive personal diary that he had kept for many years. Upon Forrestal's confinement, that diary, running thousands of pages, had been seized by the government, and after his death was apparently published only in heavily edited and expurgated form, though it nonetheless still became a historical sensation.

The government documents unearthed by Martin raise additional doubts about the story presented in all the standard history books. Forrestal's medical files seem to lack any official autopsy report, there is visible evidence of broken glass in his room, suggesting a violent struggle, and most remarkably, the page of copied Greek verse—always cited as the main indication of Forrestal's final suicidal intent—was actually not written in Forrestal's own hand.

Aside from newspaper accounts and government documents, much of Martin's analysis, including the extensive personal interviews of Forrestal's friends and relatives, is based upon a short book entitled *The Death of James Forrestal*, published in 1966 by one Cornell Simpson, almost certainly a pseudonym. Simpson states that his investigative research had been conducted just a few years after Forrestal's death and although his book was originally scheduled for release his publisher grew concerned over the extremely controversial nature of the material included and cancelled the project. According to Simpson, years later he decided to take his unchanged manuscript off the shelf and have it published by Western Islands press, which turns out to have been an imprint of the John Birch Society, the notoriously conspiratorial rightwing organization then near the height of its national influence. For these reasons, certain aspects of the book are of considerable interest even beyond the contents directly relating

to Forrestal.

The first part of the book consists of a detailed presentation of the actual evidence regarding Forrestal's highly suspicious death, including the numerous interviews with his friends and relatives, while the second portion focuses on the nefarious plots of the world-wide Communist movement, a Birch Society staple. Allegedly, Forrestal's staunch anti-Communism had been what targeted him for destruction by Communist agents, and there is virtually no reference to any controversy regarding his enormous public battle over Israel's establishment, although that was certainly the primary factor behind his political downfall. Martin notes these strange inconsistencies, and even wonders whether certain aspects of the book and its release may have been intended to deflect attention from this Zionist dimension towards some nefarious Communist plot.

Consider, for example, David Niles, whose name has lapsed into total obscurity, but who had been one of the very few senior FDR aides retained by his successor, and according to observers eventually becoming one of the most powerful figures behind the scenes of the Truman Administration. Various accounts suggest he played a leading role in Forrestal's removal, and Simpson's book supports this, suggesting that he was Communist agent of some sort. However, although the Venona Papers reveal that Niles had sometimes cooperated with Soviet agents in their espionage activities, he apparently did so either for money or for some other considerations, and was certainly not part of their own intelligence network. Instead, both Martin and Hart provide an enormous amount of evidence that Niles's loyalty was overwhelmingly to Zionism, and indeed by 1950 his espionage activities on behalf of Israel became so extremely blatant that Gen. Omar Bradley, Chairman of the Joint Chiefs of Staff, threatened to immediately resign unless Niles was fired, forcing Truman's hand.

Classics Professor Revilo Oliver, for decades a very influential figure in far right circles, had been a founding member of the John Birch Society and editor of its magazine, but angrily resigned in 1966, claiming that its leader Robert Welch, Jr. had accepted an offer of heavy financial support in return for focusing solely upon Communist misdeeds and scrupulously avoiding any discussion of Jewish or Zionist activities. Based on the evidence, that accusation appears to have considerable merit, with the Birch leadership soon treating indications of "anti-Semitism" as grounds for immediate expulsion. Major Communist political influence had largely disappeared in America by the late 1940s, while Jewish and pro-Israel influence grew

enormously from the early 1960s onward, and by focusing almost exclusively upon the former and totally avoiding the latter, the Birch organization increasingly presented a totally delusional view of American politics, which surely contributed to its eventual decline into complete irrelevance.

Among those who grow skeptical of establishment media verdicts, there is a natural tendency to become overly suspicious, and see conspiracies and cover-ups where none exist. The sudden death of a prominent political figure may be blamed on foul-play even when the causes were entirely natural or accidental. "Sometimes a cigar is just a cigar." But when a sufficient number of such persons die within a sufficiently short period of years, and overwhelming evidence suggests that at least some of those deaths were not for the reasons long believed, the burden of proof begins to shift.

Excluding the much larger number of less notable fatalities, here is a short list of six prominent Americans whose untimely passing during 1944-1949 surely evoked considerable relief within various organizations known for their ruthless tactics:

- **Wendell Wilkie**, lifelong Democrat nominated for President by the Republicans in 1940, Died October 8, 1944, Age 52, Heart attack.
- **Gen. George Patton**, highest-ranking American military officer in Europe, Died December 21, 1945, Age 60, Car accident.
- **Harry Hopkins**, FDR's "Deputy President," Died January 29, 1946, Age 55, Various possible causes.
- **Harry Dexter White**, Soviet agent who ran the Treasury under FDR, Died August 16, 1948, Age 55, Heart attack.
- **Laurence Duggan**, Soviet agent, Prospective Secretary of State under Henry Wallace, Died December 20, 1948, Age 43, Fall from 16th story window.
- **James Forrestal**, former Secretary of Defense, Died May 22, 1949, Age 57, Fall from 18th story window.

I do not think that any similar list of comparable individuals during that same time period could be produced for Britain, France, the USSR, or China. In one of the James Bond films, Agent 007 states his opinion that "Once is happenstance, twice is coincidence, three times is enemy action." And I think these six examples over just a few years should be enough to raise the eyebrows of even the most cautious and skeptical.

Foreign leaders outraged over America's destructive international blundering have sometimes described our country as possessing physical might of enormous power, but having a ruling political elite so ignorant, gullible, and incompetent that it easily falls under the sway of unscrupulous foreign powers.  We are a nation with the body of a dinosaur but controlled by the brain of a flea.

The post-war era of the 1940s surely marked an important peak of America's military and economic power.  Yet there seems considerable evidence that during those same years, a varied mix of Soviet, British, and Zionist assassins may have freely walked our soil, striking down those whom they regarded as obstacles to their national interests. Meanwhile, nearly all Americans remained blissfully unaware of these momentous developments, being lulled to sleep by 🔲Our American Pravda.🔲

# Post-War France and Post-War Germany

July 9, 2018 • 6,600 Words

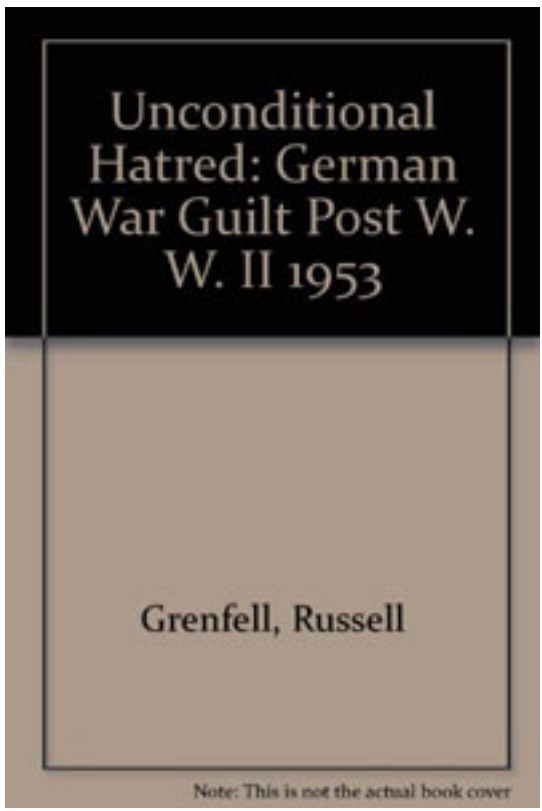
Back in Junior High School I became an avid war-gamer, and was fascinated by the military history of the past, especially World War II, the most titanic conflict ever recorded. However, although I much enjoyed reading the detailed accounts of the battles of that war, especially on the Eastern Front that largely determined its outcome, I had much less interest in the accompanying political history, and simply relied upon the accounts in my standard textbooks, which I considered quite reliable.

Supporting that strong impression, these sources hardly seemed to hide some of the uglier aspects of the conflict and its aftermath, such as the notable brutalities visited upon pro-Nazi turncoats following the Liberation of France in 1944. Pierre Laval, head of the puppet Vichy government and quite a number of his fellow quislings were tried and executed for their treason, and even Marshal Petain, the renowned French World War I hero who in his dotage had sadly lent his name to the hated regime as its head of state, was condemned to death, though his life was eventually spared. Less prominent collaborators suffered as well, with my books often carrying photos of some of the hundreds or thousands of ordinary French women who for fear, love, or money had become intimate with German soldiers during the four years of occupation, and as a consequence had their heads shaved and were marched through the streets of their towns or cities in parades of shame.

Such excesses were obviously unfortunate, but wars and liberations often unleash considerable brutality, and these spectacles of public humiliation obviously did not begin to compare with the vicious bloodshed of the years of Nazi control. For example, there was the notorious case of Oradour-sur-Glane, a village involved in Resistance activities, in which many hundreds of men, women, and children were herded into a church and other buildings and burned alive. Meanwhile, enormous numbers of Frenchmen and others had been deported to wartime Germany as slave-laborers, in total violation of every legal principle, producing an uncanny parallel to Stalin's Gulag and underscoring the similarity of those two totalitarian regimes. This, at least, had always been my limited impression of that very

unfortunate era.

Eventually, major cracks in this simple picture began appearing. I have previously written of my discovery of John T. Flynn, one of America's most prominent liberal public intellectuals throughout the 1930s, who was then purged from the mainstream media and eventually forgotten for his discordant views on certain contentious issues. From the early 1940s onward, Flynn's books only found a home at the Devin-Adair Company, a small Irish-American publishing house based in New York City. Somehow or other, perhaps six or seven years ago I became aware of another book released by that same press in 1953.



The author of *Unconditional Hatred* was Captain Russell Grenfell, a British naval officer who had served with distinction in the First World War, and later helped direct the Royal Navy Staff College, while publishing six highly-regarded books on naval strategy and serving as the Naval Correspondent of the *Daily Telegraph*. Grenfell recognized that great quantities of extreme propaganda almost inevitably accompany any major war, but with several years having passed since the close of hostilities, he was growing concerned that

unless an antidote were soon widely applied, the lingering poison of such wartime exaggerations might threaten the future peace of Europe.

His considerable historical erudition and his reserved academic tone shine through in this fascinating volume, which focuses primarily upon the events of the two world wars, but often contains digressions into the Napoleonic conflicts or even earlier ones. One of the intriguing aspects of his discussion is that much of the anti-German propaganda he seeks to debunk would today be considered so absurd and ridiculous it has been almost entirely forgotten, while much of the extremely hostile picture we currently have of Hitler's Germany receives almost no mention whatsoever, possibly because it had not yet been established or was then still considered too outlandish for anyone to take seriously. Among other matters, he reports with considerable disapproval that leading British newspapers had carried headlined articles about the horrific tortures that were being inflicted upon German prisoners at war crimes trials in order to coerce all sorts of dubious confessions out of them.

Some of Grenfell's casual claims do raise doubts about various aspects of our conventional picture of German occupation policies. He notes numerous stories in the British press of former French "slave-laborers" who later organized friendly post-war reunions with their erstwhile German employers. He also states that in 1940 those same British papers had reported the absolutely exemplary behavior of German soldiers toward French civilians, though after terroristic attacks by Communist underground forces provoked reprisals, relations often grew much worse.

Most importantly, he points out that the huge Allied strategic bombing campaign against French cities and industry had killed huge numbers of civilians, probably far more than had ever died at German hands, and thereby provoked a great deal of hatred as an inevitable consequence. At Normandy he and other British officers had been warned to remain very cautious among any French civilians they encountered for fear they might be subject to deadly attacks.

Although Grenfell's content and tone strike me as exceptionally even-handed and objective, others surely viewed his text in a very different light. The Devin-Adair jacket-flap notes that no British publisher was willing to accept the manuscript, and when the book appeared no major American reviewer recognized its existence. Even more ominously, Grenfell is described as having been hard at work on a sequel when he suddenly died in 1954 of unknown causes, and his

lengthy obituary in the London *Times* gives his age as 62. With the copyright having long lapsed, I am pleased to include this important volume in my collection of HTML Books so that those interested can easily read it and decide for themselves.

- Unconditional Hatred
  Captain Russell Grenfell • 1953 • 73,000 Words

On French matters, Grenfell provides several extended references to a 1952 book entitled *France: The Tragic Years, 1939-1947* by Sisley Huddleston, an author totally unfamiliar to me, and this whet my curiosity. One helpful use of my content-archiving system is to easily provide the proper context for long-forgotten writers, and Huddleston's scores of appearances in *The Atlantic Monthly*, *The Nation*, and *The New Republic*, plus his thirty well-regarded books on France, seem to confirm that he spent decades as one of the leading interpreters of France to educated American and British readers. Indeed, his exclusive interview with British Prime Minister Lloyd George at the Paris Peace Conference became an international scoop.

As with so many other writers, after World War II his American publisher necessarily became Devin-Adair, which released a posthumous 1955 edition of his book. Given his eminent journalistic credentials, Huddleston's work on the Vichy period was reviewed in American periodicals, although in rather cursory and dismissive fashion, but I ordered a copy and read it.

I cannot attest to the correctness of Huddleston's 350 page account of France during the war years and immediately after, but as a very distinguished journalist and longtime observer who was an eyewitness to the events he describes, writing at a time when the official historical narrative had not yet hardened into concrete, I do think that his views should be taken quite seriously. Huddleston's personal circle certainly extended quite high, with former U.S. Ambassador William Bullitt being one of his oldest friends. And without doubt Huddleston's description was radically different from the conventional story I had always heard.

Judging the credibility of a source from such a distance in time is not easy, but sometimes a single telling detail provides an important clue. In revisiting Huddleston's book, I noticed he casually mentioned that in Spring 1940 the French and British had been on the very verge of a military attack against Soviet Russia, which they regarded as Germany's crucial ally, and planned an assault on Baku, intending to destroy Stalin's great oil fields of the Caucasus by a strategic bombing campaign. I had never read a single mention of this in any of my World War II histories, and until recently I would have dismissed the story as an absurd rumor of that era, long since debunked. But just a couple of weeks ago, I discovered a 2015 article in *The National Interest* confirming these exact facts, over seventy years after they had understandably been expunged from all of our mainstream historical narratives.

As Huddleston describes things, the French army collapsed in May of 1940, and the government desperately recalled Petain, then in his mid-80s and the country's greatest war hero, from his posting as the Ambassador to Spain. Soon he was asked by the French President to form a new government and arrange an armistice with the victorious Germans, and this proposal received near-unanimous support from France's National Assembly and Senate, including the backing of virtually all the leftist parliamentarians. Petain achieved this result, and another near-unanimous vote of the French parliament then authorized him to negotiate a full peace treaty with Germany, which certainly placed his political actions on the strongest possible legal basis. At that point, almost everyone in Europe believed that the war

was essentially over, with Britain soon to make peace.

While Petain's fully-legitimate French government was negotiating with Germany, a small number of diehards, including Col. Charles de Gaulle, deserted from the army and fled abroad, declaring that they intended to continue the war indefinitely, initially attracting minimal support or attention. One interesting aspect of this situation was that De Gaulle had long been one of Petain's leading proteges, and once his political profile began rising a couple of years later, there were often quiet speculations that he and his old mentor had arranged a "division of labor," with the one making an official peace with the Germans while the other left to become the center of overseas resistance in the uncertain event that different opportunities arose.

Although Petain's new French government guaranteed that its powerful navy would never be used against the British, Churchill took no chances, and quickly launched an attack on the fleet of his erstwhile ally, whose ships were already disarmed and helplessly moored in port, sinking most of them and killing up to 2,000 Frenchmen in the process. This incident was not entirely dissimilar to the Japanese attack on Pearl Harbor the following year, and rankled the French for many years to come.

Huddleston then spends much of the book discussing the complex French politics of the next few years, as the war unexpectedly continued, with Russia and America eventually joining the Allied cause, greatly raising the odds against a German victory. During this period, the French political and military leadership performed a difficult balancing act, resisting German demands on some points and acquiescing on others, while the internal Resistance movement gradually grew, attacking German soldiers and provoking harsh German reprisals. Given my lack of expertise, I cannot really judge the accuracy of his political narrative, but it seems quite realistic and plausible to me, though specialists might surely find fault.

However, the most remarkable claims in Huddleston's book come towards the end, as he describes what eventually became known as "the Liberation of France" during 1944-45 when the retreating German forces abandoned the country and pulled back to their own borders. Among other things, he suggests that the number of Frenchmen claiming "Resistance" credentials grew as much as a hundred-fold once the Germans had left and there was no longer any risk in adopting that position.

And at that point, enormous bloodshed soon began, by far the worst

wave of extra-judicial killings in all of French history. Most historians agree that around 20,000 lives were lost in the notorious “Reign of Terror” during the French Revolution and perhaps 18,000 died during the Paris Commune of 1870-71 and its brutal suppression. But according to Huddleston the American leaders estimated there were at least 80,000 “summary executions” in just the first few months after Liberation, while the Socialist Deputy who served as Interior Minister in March 1945 and would have been in the best position to know, informed De Gaulle’s representatives that 105,000 killings had taken place just from August 1944 to March 1945, a figure that was widely quoted in public circles at the time.

Since a large fraction of the entire French population had spent years behaving in ways that now suddenly might be considered “collaborationist,” enormous numbers of people were vulnerable, even at risk of death, and they sometimes sought to save their own lives by denouncing their acquaintances or neighbors. Underground Communists had long been a major element of the Resistance, and many of them eagerly retaliated against their hated “class enemies,” while numerous individuals took the opportunity to settle private scores. Another factor was that many of the Communists who had fought in the Spanish Civil War, including thousands of the members of the International Brigades, had fled to France after their military defeat in 1938, and now often took the lead in enacting vengeance against the same sort of conservative forces which had previously vanquished them in their own country.

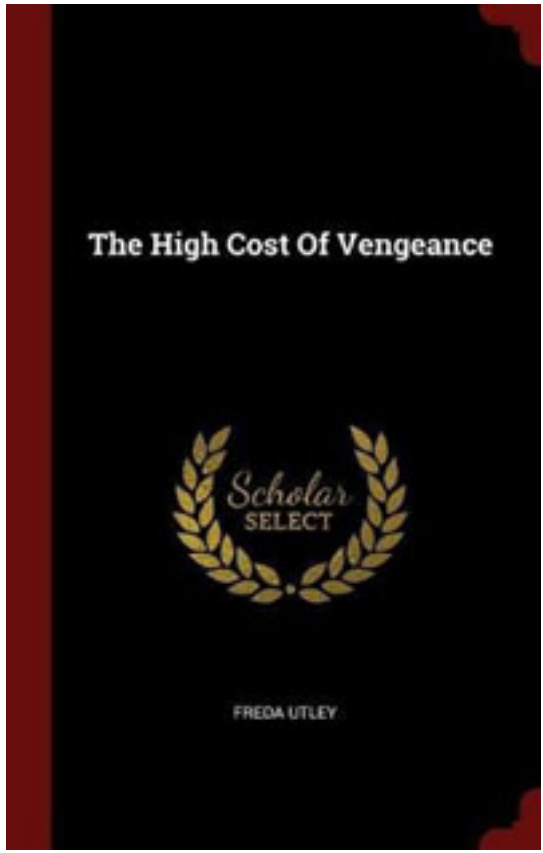
Although Huddleston himself was an elderly, quite distinguished international journalist with very highly placed American friends and he had performed some minor services on behalf of the Resistance leadership, he and his wife narrowly escaped summary execution during that period, and he provides a collection of the numerous stories he heard of less fortunate victims. But what appears to have been by far the worst sectarian bloodshed in all French history has been soothingly rechristened “the Liberation” and almost entirely removed from our historical memory, except for the famously shaved heads of a few disgraced women. These days Wikipedia constitutes the congealed distillation of our Official Truth, and its entry on those events puts the death toll at barely one-tenth the figures quoted by Huddleston, but I find him a far more credible source.

- France: The Tragic Years, 1939-1947
  Sisley Huddleston • 1955 • 65,000 Words

Often knocking the first hole in a mighty wall is the most difficult. Once I became persuaded that my entire understanding of the post-war history of France was entirely wrong and to some extent backward, I naturally became much more open to further revelations. If France—a leading member of the victorious Allied coalition of World War II—had actually suffered an unprecedented orgy of revolutionary terror and killings, perhaps my standard history had also been less than totally candid in its description of defeated Germany's fate. I had certainly read of the horrors inflicted by Russian troops, with perhaps two million German women and girls brutally raped, and there was usually a sentence or two about the expulsion of many millions of ethnic Germans from the lands controlled by Poland, Czechoslovakia, and other Eastern European countries vengeful after their years under the terrible Nazi yoke. There was also some mention of the remarkably vindictive Morgenthau Plan, fortunately almost immediately abandoned, and a focus on the German economic rebirth under the generosity of America's Marshall Plan. But I began to wonder if there was actually more to the story.

I soon came across references to some of the writings of Freda Utley, now largely forgotten, but once a fairly prominent author and journalist in the America of the 1940s and 1950s, with an interesting personal background. Born an Englishwoman in a family connected with George Bernard Shaw and the Fabians, she took up Communism and in 1928 married a Soviet Jew of a similar ideological persuasion, with the couple then moving to the Soviet Union to help build the Motherland of the Socialist Revolution. As was the case with so many other foreign Communists, they grew increasingly disillusioned with their Soviet lives until one day in 1936 her husband was arrested in a Stalinist purge, never to be seen again. She eventually fled the USSR with her infant son Jon, reaching our shores in 1939. Almost seventy years later, I became acquainted with Jon Utley through our mutual involvement in *The American Conservative* magazine.

Given Freda Utley's first-hand experiences from a decade in the USSR, her views on Soviet Communism were decidedly negative, very different from that of most of America's intellectual and journalistic elite. As a consequence, she was quickly tagged as an "anti-Communist," and her numerous subsequent books and articles over the next couple of decades were generally relegated to publishers of that orientation, viewed with disfavor by mainstream media outlets.



In 1948 she spent several months traveling around Occupied Germany, and the following year published her experiences in *The High Cost of Vengeance*, which I found eye-opening. Unlike the vast majority of other American journalists, who generally took brief, heavily-chaperoned visits, Utley actually spoke German and was quite familiar with the country, having frequently visited it during the Weimar Era. Whereas Grenfell's discussion was highly restrained and almost academic in its tone, her own writing was considerably more strident and emotional, hardly surprising given her direct encounter with extremely distressing subject matter. Her eyewitness testimony seemed quite credible, and the factual information she provided, buttressed by numerous interviews and anecdotal observations, was gripping.

More than three years after the end of hostilities, Utley encountered a land still almost totally ruined, with large portions of the population forced to seek shelter in damaged basements or share tiny rooms in broken buildings. The population regarded itself as being "without rights," often subject to arbitrary treatment by occupation troops or other privileged elements, who stood completely outside the legal

jurisdiction of the regular local police. Germans in large numbers were regularly removed from their homes, which were used to billet American troops or others who found favor with them, a situation that had been noted with some outrage in Gen. George Patton's posthumously published diaries. Even at this point, a foreign soldier might still sometimes seize anything he wanted from German civilians, with potentially dangerous consequences if they protested the theft. Utley tellingly quotes a former German soldier who had served occupation duties in France and remarked that he and his comrades had operated under strictest discipline and could never have imagined behaving toward French civilians in the manner that current Allied troops now treated German ones.

Some of Utley's quoted claims are quite astonishing, but seem solidly based on reputable sources and fully confirmed elsewhere. Throughout the first three years of peacetime, the daily food ration allocated to Germany's entire civilian population was roughly 1550 calories, approximately the same as that provided to the inmates of German concentration camps during the war recently ended, and it sometimes dropped far, far lower. During the difficult winter of 1946-47, the entire population of the Ruhr, Germany's industrial heartland, had only received starvation rations of 700-800 calories per day, and even lower levels were sometimes reached.

Influenced by hostile official propaganda, the widespread attitude of Allied personnel towards ordinary Germans was certainly as bad as anything faced by the natives living under a European colonial regime. Time and again, Utley notes the remarkable parallels with the treatment and attitude she had previously seen Westerners take towards the native Chinese during most of the 1930s, or that the British had expressed to their Indian colonial subjects. Small German boys, shoeless, destitute, and hungry, eagerly retrieved balls at American sporting-clubs for a tiny pittance. Today it is sometimes disputed whether American cities during the late 19th century actually contained signs reading "No Irish Need Apply," but Utley certainly saw signs reading "No Dogs or Germans Allowed" outside numerous establishments frequented by Allied personnel.

Based on my standard history textbooks, I had always believed that there existed a total night-and-day difference in the behavior toward local civilians between the German troops who occupied France from 1940-44 and the Allied troops who occupied Germany from 1945 onward. After reading the detailed accounts of Utley and other contemporaneous sources, I think my opinion was absolutely correct, but with the direction reversed.

Utley believed part of the reason for this utterly disastrous situation was deliberate American government policy. Although the Morgenthau Plan—aimed at eliminating half or so of Germany's population—had been officially abandoned and replaced with the Marshall Plan promoting German revival, she found that many aspects of the former actually still held sway in practice. Even as late as 1948, huge portions of the German industrial base continued to be dismantled and shipped off to other countries while very tight restrictions on German production and exports remained in place. Indeed, the level of poverty, misery, and oppression she saw everywhere almost seemed deliberately calculated to turn ordinary Germans against America and its Western allies, perhaps opening the door to Communist sympathies. Such suspicions are certainly strengthened when we consider that this system had been devised by Harry Dexter White, later revealed to be a Soviet agent.

She was especially scathing about the total perversion of any basic notions of human justice during the Nuremberg Tribunal and various other war crime trials, a subject to which she devoted two full chapters. These judicial proceedings exhibited the worst sort of legal double-standards, with leading Allied judges explicitly stating that their own countries were not at all bound by the same international legal conventions which they claimed to be enforcing against German defendants. Even more shocking were some of the measures used, with outraged American jurists and journalists revealing that horrific torture, threats, blackmail, and other entirely illegitimate means were regularly employed to obtain confessions or denunciations of others, a situation that strongly suggested a very considerable number of those condemned and hanged were entirely innocent.

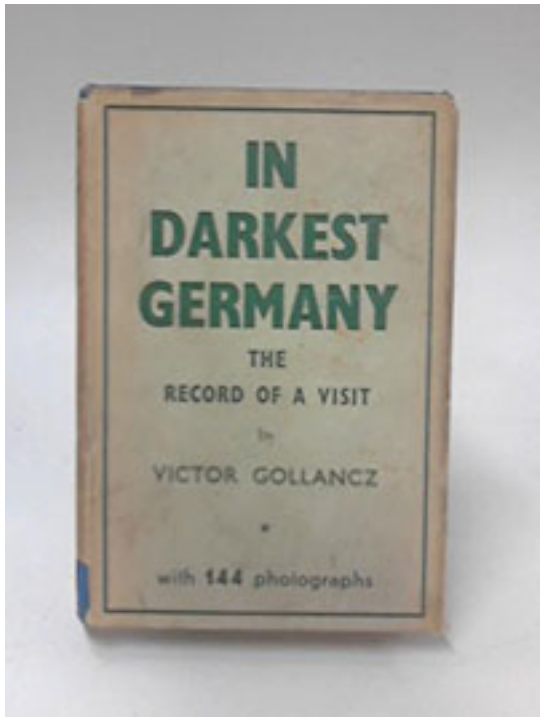
Her book also gave substantial coverage to the organized expulsions of ethnic Germans from Silesia, the Sudatenland, East Prussia, and various other parts of Central and Eastern Europe where they had peacefully lived for many centuries, with the total number of such expellees generally estimated at 13 to 15 million. Families were sometimes given as little as ten minutes to leave the homes in which they had resided for a century or more, then forced to march off on foot, sometimes for hundreds of miles, towards a distant land they had never seen, with their only possessions being what they could carry in their own hands. In some cases, any surviving menfolk were separated out and shipped off to slave-labor camps, thereby producing an exodus consisting solely of women, children, and the very elderly. All estimates were that at least a couple million perished along the way,

from hunger, illness, or exposure.

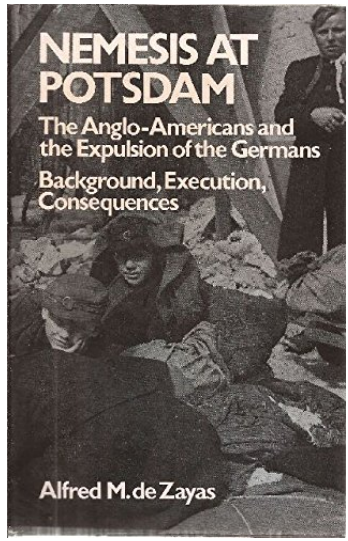
These days we endlessly read painful discussions of the notorious "Trail of Tears" suffered by the Cherokees in the distant past of the early 19th century, but this rather similar 20th Century event was nearly a thousand-fold larger in size. Despite this huge discrepancy in magnitude and far greater distance in time, I would guess that the former event may command a thousand times the public awareness among ordinary Americans. If so, this would demonstrate that overwhelming media control can easily shift perceived reality by a factor of a million or more.

The population movement certainly seems to have represented the largest ethnic-cleansing in the history of the world, and if the Germany had ever done anything even remotely similar during its years of European victories and conquests, the visually-gripping scenes of such an enormous flood of desperate, trudging refugees would surely have become a centerpiece of numerous World War II movies of the last seventy years. But since nothing like that ever happened, Hollywood screenwriters lost a tremendous opportunity.

- The High Cost of Vengeance
  Freda Utley • 1949 • 125,000 Words

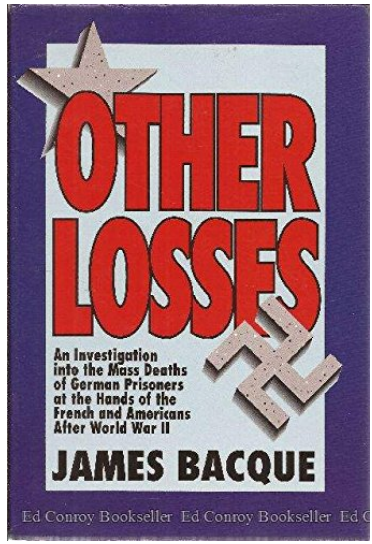


Utley's extremely grim portrayal is strongly corroborated by numerous other sources. In 1946, Victor Gollanz, a prominent British publisher from a Socialistic Jewish background, took an extended visit to Germany, and published *In Darkest Germany* the following year, recounting his enormous horror at the conditions he discovered there. His claims of the appalling malnutrition, illness, and total destitution were supported by over a hundred chilling photographs, and the introduction to the American edition was written by University of Chicago President Robert M. Hutchins, one of our most reputable public intellectuals of that era. But his slim volume seems to have attracted relatively little attention in the American mainstream media, although his somewhat similar book *Our Threatened Values*, published the previous year and based upon information from official sources had received a little more. *Gruesome Harvest* by Ralph Franklin Keeling, also published in 1947, helpfully gathers together a large number of official statements and reports from major media outlets, which generally support exactly this same picture of the first few years of Germany under Allied occupation.



NEMESIS AT POTSDAM
The Anglo-Americans and the Expulsion of the Germans
Background, Execution, Consequences
Alfred M. de Zayas

During the 1970 and 1980s this distressing topic was taken up by Alfred M. de Zayas, who held a Harvard Law degree and doctorate in history, and served a long and illustrious career as a leading international human rights lawyer long affiliated with the United Nations. His books such as *Nemesis at Potsdam*, *A Terrible Revenge*, and *The Wehrmacht War Crimes Bureau, 1939-1945* especially focused on the massive ethnic cleansing of the German minorities, and were based on great quantities of archival research. They received considerable scholarly praise and notice in major academic journals and sold hundreds of thousands of copies in Germany and other parts of Europe, but hardly seem to have penetrated the consciousness of America or the rest of the English-speaking world.



OTHER
LOSSES
An Investigation into the Mass Deaths of German Prisoners at the Hands of the French and Americans After World War II
JAMES BACQUE
Ed Conroy Bookseller Ed Conroy Bookseller

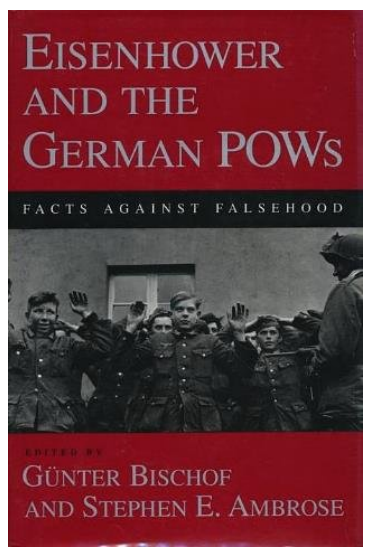
In the late 1980s this smoldering historical debate took a remarkable new turn. While visiting France during 1986 in preparation for an unrelated book, a Canadian writer named James Bacque stumbled upon clues suggesting that one of the most terrible secrets of post-war Germany had long remained completely hidden, and he soon embarked upon extensive research into the subject, finally publishing *Other Losses* in 1989. Based upon very considerable evidence, including government records, personal interviews, and recorded eyewitness testimony, he argued that after the end of the war, the Americans had starved to death as many as a million German POWs, seemingly as a deliberate act of policy, a war crime that would surely rank among the greatest in history.

For decades, Western propagandists had relentlessly barraged the Soviets with claims that they were keeping back a million or more "missing" German POWs as slave-laborers in their Gulag, while the Soviets had endlessly denied these accusations. According to Bacque, the Soviets had been telling the truth all along, and the missing soldiers had been among the enormous numbers who had fled westward near the end of the war, seeking what they assumed would be far better treatment at the hands of the advancing Anglo-American armies. But instead, they were denied all normal legal protections, and confined under horrible conditions where they rapidly perished of hunger, illness, and exposure.

Without attempting to summarize Bacque's extensive accumulation of supporting material, a few of his factual elements are worth mentioning. At the close of hostilities, the American government

employed circuitous legal reasoning to argue that the many millions of German troops that they had captured should not be considered "prisoners of war" and therefore were not covered by the provisions of the Geneva Convention. Soon afterward, attempts by the International Red Cross to provide food shipments to the enormous Allied prison camps were repeatedly rejected, and notices were posted throughout the nearby German towns and villages that any civilian who attempted to smuggle food to the desperate POWs might be shot on sight. These undeniable historical facts do seem to suggest certain dark possibilities.

Although initially released by an obscure publisher, Bacque's book soon became a sensation and an international best-seller. He paints Gen. Dwight Eisenhower as the central culprit behind the tragedy, noting the far lower POW losses in areas outside his control, and suggests that as a highly ambitious "political general" of German-American ancestry, he may have been under intense pressure to demonstrate his "harshness" toward the defeated *Wehrmacht* foe.



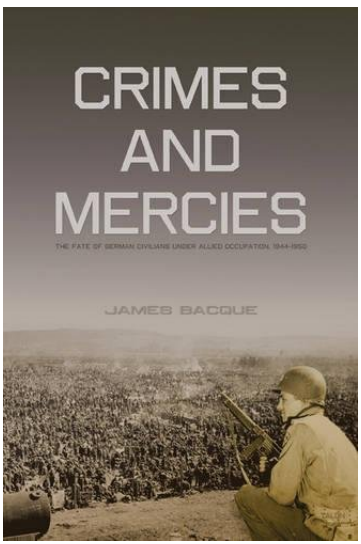
Historian Stephen Ambrose, who had made a lucrative career by churning out numerous hagiographic volumes on Eisenhower and World War II aided by his widespread plagiarism, reacted in horror at Bacque's claims, and quickly organized a symposium volume under the auspices of the Eisenhower Center, hoping to rebut the monstrous accusations that had been levied against his personal meal-ticket. But although I felt that he and the wide assortment of co-authors he conscripted into his project did raise some valid doubts about portions of Bacque's evidence, they seemed unable to effectively challenge the

bulk of it, except perhaps by arguing that something so enormous could not possibly have been kept hidden for so long. Moreover, Ambrose and his colleagues grudgingly admitted the official American statistics of POW mortality rates—which none of them had ever previously questioned—were impossibly low, but chose to resolve this difficulty by rather arbitrarily quadrupling those figures, which hardly raises great confidence in their methods.

Furthermore, once the Cold War ended and the Soviet Archives were open to scholars, their contents seem to have strongly validated Bacque's thesis. He notes that although the archives do contain explicit evidence of such long-denied atrocities as Stalin's Katyn Forest massacre of Poland's officer corps, they show absolutely no signs of any million missing German POWs, who instead had very likely ended their lives in the starvation and illness of Eisenhower's death camps. Bacque points out that the German government has issued severe legal threats against anyone seeking to investigate the likely sites of the mass graves that might hold the remains of those long-dead POWs, and in an updated edition, he also mentions Germany's enactment of harsh new laws meting out heavy prison sentences to anyone who merely questions the official narrative of World War II.

Bacque ironically notes that the Soviet archival records of their own German POWs show a reasonably high but generally normal death rate across the years of captivity, with nothing like the huge losses that apparently occurred so quickly in the Western camps on German soil, and this was despite the far greater poverty of the post-war USSR. But we should really not regard this fact as so surprising. Stalin, a Georgian, reigned as the Soviet autarch, and in the past he had freely ordered the deaths of vast numbers of his own subjects, Russian or not, in order to enforce his rule. The Germans had opposed and fought him as well, and they had suffered greatly for it, but once their resistance was ended and they were now under his power, why would he feel especially punitive towards them? Friedrich Paulus, the Field Marshal who had commanded at Stalingrad, later declared his loyalty to the Soviets and was given a post of honor in the new East Germany, so ordinary POWs who obeyed and worked productively would certainly be fed.

Although now quite elderly, a couple of years ago Bacque gave a lengthy interview to Red Ice Radio, and those interested may listen to it on YouTube, which also hosts various other video presentations on the same subject:



Bacque's discussion of the new evidence of the Kremlin archives constitutes a relatively small portion of his 1997 sequel, *Crimes and Mercies*, which centered around an even more explosive analysis, and also became an international best-seller.

As described above, first-hand observers of post-war Germany in 1947 and 1948 such as Gollanz and Utley, had directly reported on the horrific conditions they discovered, and stated that for years official food rations for the entire population had been comparable to that of the inmates of Nazi concentration camps and sometimes far lower, leading to the widespread malnutrition and illness they witnessed all

around them. They also noted the destruction of most of Germany's pre-war housing stock and the severe overcrowding produced by the influx of so many millions of pitiful ethnic German refugees expelled from other parts of Central and Eastern Europe. But these visitors lacked any access to solid population statistics, and could only speculate upon the enormous human death toll that hunger and illness had already inflicted, and which would surely continue if policies were not quickly changed.

Years of archival research by Bacque attempt to answer this question, and the conclusion he provides is certainly not a pleasant one. Both the Allied military government and the later German civilian authorities seem to have made a concerted effort to hide or obscure the true scale of the calamity visited upon German civilians during the years 1945-1950, and the official mortality statistics found in government reports are simply too fantastical to possibly be correct, although they became the basis for the subsequent histories of that period. Bacque notes that these figures suggest that the death rate during the terrible conditions of 1947, long remembered as the "Hunger Year" (*Hungerjahr*) and vividly described in Gollancz's account, was actually lower than that of the prosperous Germany of the late 1960s. Furthermore, private reports by American officials, mortality rates from individual localities, and other strong evidence demonstrate that these long-accepted aggregate numbers were essentially fictional.

Instead, Bacque attempts to provide more realistic estimates based upon an examination of the population totals of the various German censuses together with the recorded influx of the huge number of German refugees. Applying this simple analysis, he makes a reasonably strong case that the excess German deaths during that period amounted to at least around 10 million, and possibly many millions more. Furthermore, he provides substantial evidence that the starvation was either deliberate or at least enormously worsened by American government resistance to overseas food relief efforts. Perhaps these numbers should not be so totally surprising given that the official Morgenthau Plan had envisioned the elimination of around 20 million Germans, and as Bacque demonstrates, top American leaders quietly agreed to continue that policy in practice even while they renounced it in theory.

Assuming these numbers are even remotely correct, the implications are quite remarkable. The toll of the human catastrophe experienced in post-war Germany would certainly rank among the greatest in modern peacetime history, far exceeding the deaths that occurred

during the Ukrainian Famine of the early 1930s and possibly even approaching the wholly unintentional losses during Mao's Great Leap Forward of 1959-61. Furthermore, the post-war German losses would vastly outrank either of these other unfortunate events in percentage terms and this would remain true even if the Bacque's estimates are considerably reduced. Yet I doubt if even a small fraction of one percent of Americans are today aware of this enormous human calamity. Presumably memories are much stronger in Germany itself, but given the growing legal crackdown on discordant views in that unfortunate country, I suspect that anyone who discusses the topic too energetically risks immediate imprisonment.

To a considerable extent, this historical ignorance has been heavily fostered by our governments, often using underhanded or even nefarious means. Just like in the old decaying USSR, much of the current political legitimacy of today's American government and its various European vassal-states is founded upon a particular narrative history of World War II, and challenging that account might have dire political consequences. Bacque credibly relates some of the apparent efforts to dissuade any major newspaper or magazine from running articles discussing the startling findings of his first book, thereby imposing a "blackout" aimed at absolutely minimizing any media coverage. Such measures seem to have been quite effective, since until eight or nine years ago, I'm not sure I had ever heard a word of these shocking ideas, and I have certainly never seen them seriously discussed in any of the numerous newspapers or magazines that I have carefully read over the last three decades.

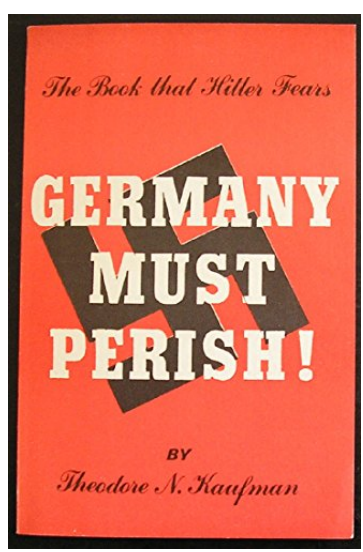
Even illegal means were employed to hinder the efforts of this solitary, determined scholar. At times, Bacque's phone-lines were tapped, his mail intercepted, and his research materials surreptitiously copied, while his access to some official archives was blocked. Some of the elderly eyewitnesses who personally corroborated his analysis received threatening notes and had their property vandalized.

In his Foreword to this 1997 book, De Zayas, the eminent international human rights attorney, praised Bacque's ground-breaking research, and hoped that it would soon lead to a major scholarly debate aimed at reassessing the true facts of these historical events that had taken place a half-century earlier. But in his update to the 2007 edition, he expressed some outrage that no such discussion ever occurred, and instead the German government merely passed a series of harsh laws mandating prison sentences for anyone who substantially disputed the settled narrative of World War II and its immediate aftermath, perhaps by overly focusing on the suffering of

German civilians.

Although both of Bacque's books became international best-sellers, the near-complete absence of any secondary media coverage ensured that they never entered public awareness with anything more than a pinprick. Another important factor is the tremendously disproportionate reach of print and electronic media. A best-seller may be read by many tens of thousands of people, but a successful film might reach tens of millions, and so long as Hollywood churns out endless movies denouncing Germany's atrocities but not a single one on the other side, the true facts of that history are hardly likely to gain much traction. I strongly suspect that far more people today believe in the real-life existence of Batman and Spiderman than are even aware of the Bacque Hypothesis.

In assessing the political factors that apparently produced such an enormous and seemingly deliberate death toll among German civilians long after the fighting had ended, an important point should be made. Historians seeking to demonstrate Hitler's tremendous wickedness or to suggest his knowledge of various crimes committed during the course of the Second World War are regularly forced to sift tens of thousands of his printed words for a suggestive phrase here and there, and then interpret these vague allusions as absolutely conclusive declarative statements. Those who fail to stretch the words to fit, such as renowned British historian David Irving, will sometimes see their careers destroyed as a consequence.



But as early as 1940, an American Jew named Theodore Kaufman became so enraged at what he regarded as Hitler's mistreatment of German Jewry that he published a short book evocatively entitled *Germany Must Perish!*, in which he explicitly proposed the total extermination of the German people. And that book apparently received favorable if perhaps not entirely serious discussion in many of our most prestigious media outlets, including the *New York Times*, the *Washington Post*, and *Time Magazine*. If such sentiments were being freely expressed in certain quarters even before America's actual entrance into the military conflict, then perhaps the long-hidden policies that Bacque seems to have uncovered should not be so totally shocking to us.

Cynics have sometimes noted that one ironic aspect of Hollywood fare both in television and film is the overwhelming anti-realism regularly displayed on topics carrying a strong ideological tinge. Action movies invariably show small females easily knocking around numerous large male antagonists with well-timed blows and kicks, while blacks are quite frequently portrayed as brilliant scientists and scholars but only very rarely as street criminals or hoodlums. So some three generations after V-E Day, perhaps the still continuing stream of World War II films portraying Germans in a particular light should be best understood in these terms.

# Oddities of the Jewish Religion

July 16, 2018 • 7,800 Words

About a decade ago, I happened to be talking with an eminent academic scholar who had become known for his sharp criticism of Israeli policies in the Middle East and America's strong support for them. I mentioned that I myself had come to very similar conclusions some time before, and he asked when that had happened. I told him it had been in 1982, and I think he found my answer quite surprising. I got the sense that date was decades earlier than would have been given by almost anyone else he knew.

Sometimes it is quite difficult to pinpoint when one's world view on a contentious topic undergoes sharp transformation, but at other times it is quite easy. My own perceptions of the Middle East conflict drastically shifted during Fall 1982, and they have subsequently changed only to a far smaller extent. As some might remember, that period marked the first Israeli invasion of Lebanon, and culminated in the notorious Sabra-Shatila Massacre during which hundreds or even thousands of Palestinians were slaughtered in their refugee camps. But although those events were certainly major factors in my ideological realignment, the crucial trigger was actually a certain letter to the editor published around that same time.

A few years earlier, I had discovered *The London Economist*, as it was then called, and it had quickly become my favorite publication, which I religiously devoured cover-to-cover every week. And as I read the various articles about the Middle East conflict in that publication, or others such as the *New York Times*, the journalists occasionally included quotes from some particularly fanatic and irrational Israeli Communist named Israel Shahak, whose views seemed totally at odds with those of everyone else, and who was consequently treated as a fringe figure. Opinions that seem totally divorced from reality tend to stick in one's mind, and it took only one or two appearances from that apparently die-hard and delusional Stalinist for me to guess that he would always take an entirely contrary position on every given issue.

In 1982 Israel Defense Minister Ariel Sharon launched his massive invasion of Lebanon using the pretext of the wounding of an Israeli diplomat in Europe at the hands of a Palestinian attacker, and the extreme nature of his action was widely condemned in the media outlets I read at the time. His motive was obviously to root out the

PLO's political and military infrastructure, which had taken hold in many of Lebanon's large Palestinian refugee camps. But back in those days invasions of Middle Eastern countries on dubious prospects were much less common than they have subsequently become, after our recent American wars killed or displaced so many millions, and most observers were horrified by the utterly disproportionate nature of his attack and the severe destruction he was inflicting upon Israel's neighbor, which he seemed eager to reduce to puppet status. From what I recall, he made several entirely false assurances to top Reagan officials about his invasion plans, such that they afterward called him the worst sort of liar, and he ended up besieging the Lebanese capital of Beirut even though he had originally promised to limit his assault to a mere border incursion.

The Israeli siege of the PLO-controlled areas of Beirut lasted some time, and negotiations eventually resulted in the departure of the Palestinian fighters to some other Arab country. Shortly afterward, the Israelis declared that they were moving into West Beirut in order to better assure the safety of the Palestinian women and children left behind and protect them from any retribution at the hands of their Christian Falangist enemies. And around that same time, I noticed a long letter in *The Economist* by Shahak which seemed to me the final proof of his insanity. He claimed that it was obvious that Sharon had marched to Beirut with the intent of organizing a massacre of the Palestinians, and that this would shortly take place. When the slaughter indeed occurred not long afterward, apparently with heavy Israeli involvement and complicity, I concluded that if a crazy Communist fanatic like Shahak had been right, while apparently every mainstream journalist had been so completely wrong, my understanding of the world and the Middle East required total recalibration. Or at least that's how I've always remembered those events from a distance of over thirty-five years.

During the years that followed, I still periodically saw Shahak's statements quoted in my mainstream publications, which sometimes suggested that he was a Communist and sometimes not. Naturally enough, his ideological extremism made him a prominent opponent of the 1991 Oslo Peace Agreement between Israel and the occupied Palestinians, which was otherwise supported by every sensible person, though since Oslo ended up being entirely a failure, I couldn't hold it too strongly against him. I stopped paying much attention to foreign policy issues during the 1990s, but I still read my *New York Times* every morning and would occasionally see his quotes, inevitably contrarian and irredentist.

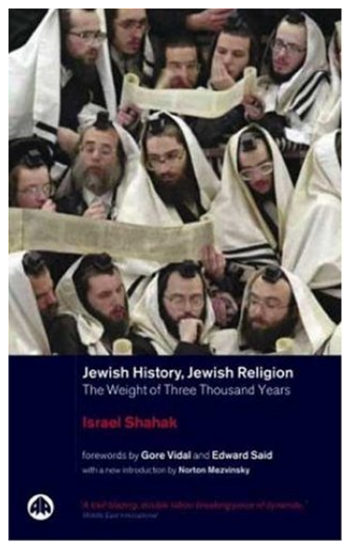
Then the 9/11 attacks returned foreign policy and the Middle East to the absolute center of our national agenda, and I eventually read somewhere or other that Shahak had died at age 68 only a few months earlier, though I hadn't noticed any obituary. Over the years, I'd seen some vague mention that during the previous decade he'd published a couple of stridently anti-Jewish and anti-Zionist books, just as might be expected from a hard-line Communist fanatic, and during the early 2000s I started seeing more and more references to these works, ironically coming from fringe sources of the anti-Semitic Far Right, thereby once again proving that extremists flock together. Finally, about a decade ago, my curiosity got the better of me and clicking a few buttons on Amazon.com, I ordered copies of his books, all of which were quite short.

My first surprise was that Shahak's writings included introductions or glowing blurbs by some of America's most prominent public intellectuals, including Christopher Hitchens, Gore Vidal, Noam Chomsky, and Edward Said. Praise also came from quite respectable publications such as *The London Review of Books*, *Middle East International*, and *Catholic New Times* while Allan Brownfeld of *The American Council for Judaism* had published a very long and laudatory obituary. And I discovered that Shahak's background was very different than I had always imagined. He had spent many years as an award-winning Chemistry professor at Hebrew University, and was actually anything but a Communist. Whereas for decades, Israel's ruling political parties had been Socialist or Marxist, his personal doubts about Socialism had left him politically in the wilderness, while his relationship with Israel's tiny Communist Party was solely because they were the only group willing to stand up for the basic human rights issues that were his own central focus. My casual assumptions about his views and background had been entirely in error.

Once I actually began reading his books, and considering his claims, my shock increased fifty-fold. Throughout my entire life, there have been very, very few times I have ever been so totally astonished as I was after I digested *Jewish History, Jewish Religion: The Weight of Three Thousand Years*, whose text runs barely a hundred pages. In fact, despite his solid background in the academic sciences and the glowing endorsements provided by prominent figures, I found it quite difficult to accept the reality of what I was reading. As a consequence, I paid a considerable sum to a young graduate student I knew, tasking him to verify the claims in Shahak's books, and as far as he could tell, all of

the hundreds of references he checked seemed to be accurate or at least found in other sources.

Even with all of that due diligence, I must emphasize that I cannot directly vouch for Shahak's claims about Judaism. My own knowledge of that religion is absolutely negligible, mostly being limited to my childhood, when my grandmother occasionally managed to drag me down to services at the local synagogue, where I was seated among a mass of elderly men praying and chanting in some strange language while wearing various ritualistic cloths and religious talismans, an experience that I always found much less enjoyable than my usual Saturday morning cartoons.



Jewish History, Jewish Religion
The Weight of Three Thousand Years
Israel Shahak
forewords by Gore Vidal and Edward Said
with a new introduction by Norton Mezvinsky

Although Shahak's books are quite short, they contain such a density of astonishing material, it would take many, many thousands of words to begin to summarize them. Almost everything I had known—or thought I had known—about the religion of Judaism, at least in its zealously Orthodox traditional form, was utterly wrong.

For example, traditionally religious Jews pay little attention to most of the Old Testament, and even very learned rabbis or students who have devoted many years to intensive study may remain largely ignorant of its contents. Instead, the center of their religious world view is the Talmud, an enormously large, complex, and somewhat contradictory mass of secondary writings and commentary built up over many centuries, which is why their religious doctrine is sometimes called "Talmudic Judaism." Among large portions of the faithful, the Talmud is supplemented by the Kabala, another large collection of accumulated writings, mostly focused on mysticism and all sorts of

magic. Since these commentaries and interpretations represent the core of the religion, much of what everyone takes for granted in the Bible is considered in a very different manner.

Given the nature of the Talmudic basis of traditional Judaism and my total previous ignorance of the subject, any attempt on my part of summarize some of the more surprising aspects of Shahak's description may be partially garbled, and is certainly worthy of correction by someone better versed in that dogma. And since so many parts of the Talmud are highly contradictory and infused with complex mysticism, it would be impossible for someone like me to attempt to disentangle the seeming inconsistencies that I am merely repeating. I should note that although Shahak's description of the beliefs and practices of Talmudic Judaism provoked a fire-storm of denunciations, few of those harsh critics seem to have denied his very specific claims, including the most astonishing ones, which would seem to strengthen his credibility.

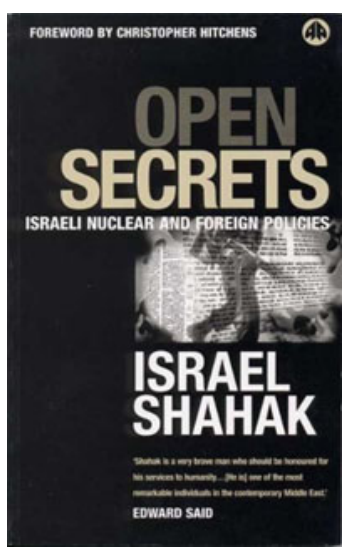
with a new introduction by Norton Mezvinsky
The Washington Report on Middle East Affairs

On the most basic level, the religion of most traditional Jews is actually not at all monotheistic, but instead contains a wide variety of different male and female gods, having quite complex relations to each other, with these entities and their properties varying enormously among the numerous different Jewish sub-sects, depending upon which portions of the Talmud and the Kabala they place uppermost. For example, the traditional Jewish religious cry "The Lord Is One" has always been interpreted by most people to be an monotheistic affirmation, and indeed, many Jews take exactly this same view. But large numbers of other Jews believe this declaration instead refers to achievement of sexual union between the primary

male and female divine entities. And most bizarrely, Jews having such radically different views see absolutely no difficulty in praying side by side, and merely interpreting their identical chants in very different fashion.

Furthermore, religious Jews apparently pray to Satan almost as readily as they pray to God, and depending upon the various rabbinical schools, the particular rituals and sacrifices they practice may be aimed at enlisting the support of the one or the other. Once again, so long as the rituals are properly followed, the Satan-worshippers and the God-worshippers get along perfectly well and consider each other equally pious Jews, merely of a slightly different tradition. One point that Shahak repeatedly emphasizes is that in traditional Judaism the nature of the ritual itself is absolutely uppermost, while the interpretation of the ritual is rather secondary. So perhaps a Jew who washes his hands three times clockwise might be horrified by another who follows a counter-clockwise direction, but whether the hand-washing were meant to honor God or to honor Satan would be hardly be a matter of much consequence.

Strangely enough, many of the traditional rituals are explicitly intended to fool or trick God or His angels or sometimes Satan, much like the mortal heroes of some Greek legend might seek to trick Zeus or Aphrodite. For example, certain prayers must be uttered in Aramaic rather than Hebrew on the grounds that holy angels apparently don't understand the former language, and their confusion allows those verses to slip by unimpeded and take effect without divine interference.



Furthermore, since the Talmud represents a massive accretion of published commentary built up over more than a millennium, even the most explicit mandates have sometimes been transformed into their opposites. As an example, Maimonides, one of the highest rabbinical authorities, absolutely prohibited rabbis from being paid for their religious teaching, declaring that any rabbi who received a salary was an evil robber condemned to everlasting torment; yet later rabbis eventually "reinterpreted" this statement to mean something entirely different, and today almost all rabbis collect salaries.

Another fascinating aspect is that up until very recent times, the lives of religious Jews were often dominated by all sorts of highly superstitious practices, including magical charms, potions, spells, incantations, hexes, curses, and sacred talismans, with rabbis often having an important secondary role as sorcerers, and this even remains entirely true today among the enormously influential rabbis of Israel and the New York City area. Shahak's writings had not endeared him to many of these individuals, and for years they constantly attacked him with all sorts of spells and fearful curses aimed at achieving his death or illness. Many of these traditional Jewish practices seem not entirely dissimilar to those we typically associate with African witch-doctors or Voodoo priests, and indeed, the famous legend of the Golem of Prague described the successful use of rabbinical magic to animate a giant creature built of clay.

If these ritualistic issues constituted the central features of traditional religious Judaism, we might regard it as a rather colorful and eccentric survival of ancient times. But unfortunately, there is also a far darker side, primarily involving the relationship between Jews and non-Jews, with the highly derogatory term *goyim* frequently used to describe the latter. To put it bluntly, Jews have divine souls and *goyim* do not, being merely beasts in the shape of men. Indeed, the primary reason for the existence of non-Jews is to serve as the slaves of Jews, with some very high-ranking rabbis occasionally stating this well-known fact. In 2010, Israel's top Sephardic rabbi used his weekly sermon to declare that the only reason for the existence of non-Jews is to serve Jews and do work for them. The enslavement or extermination of all non-Jews seems an ultimate implied goal of the religion.

Jewish lives have infinite value, and non-Jewish ones none at all, which has obvious policy implications. For example, in a published article a prominent Israeli rabbi explained that if a Jew needed a liver,

it would be perfectly fine and indeed obligatory, to kill an innocent Gentile and take his. Perhaps we should not be too surprised that today Israel is widely regarded as one of the world centers of organ-trafficking.

As a further illustration of the seething hatred traditional Judaism radiates towards all those of a different background, saving the life of a non-Jew is generally considered improper or even prohibited, and taking any such action on the Sabbath would be an absolute violation of religious edict. Such dogmas are certainly ironic given the widespread presence of Jews in the medical profession during recent centuries, but they came to the fore in Israel when a religiously-minded military doctor took them to heart and his position was supported by the country's highest religious authorities.

And while religious Judaism has a decidedly negative view towards all non-Jews, Christianity in particular is regarded as a total abomination, which must be wiped from the face of the earth.

Whereas pious Muslims consider Jesus as the holy prophet of God and Muhammed's immediate predecessor, according to the Jewish Talmud, Jesus is perhaps the vilest being who ever lived, condemned to spend eternity in the bottommost pit of Hell, immersed in a boiling vat of excrement. Religious Jews regard the Muslim Quran as just another book, though a totally mistaken one, but the Christian Bible represents purest evil, and if circumstances permit, burning Bibles is a very praiseworthy act. Pious Jews are also enjoined to always spit three times at any cross or church they encounter, and direct a curse at all Christian cemeteries. Indeed, many deeply religious Jews utter a prayer each and every day for the immediate extermination of all Christians.

Over the years prominent Israeli rabbis have sometimes publicly debated whether Jewish power has now become sufficiently great that all the Christian churches of Jerusalem, Bethleham, and other nearby areas can finally be destroyed, and the entire Holy Land completely cleansed of all traces of its Christian contamination. Some have taken this position, but most have urged prudence, arguing that Jews needed to gain some additional strength before they should take such a risky step. These days, many tens of millions of zealous Christians and especially Christian Zionists are enthusiastic advocates for Jews, Judaism, and Israel, and I strongly suspect that at least some of that enthusiasm is based upon ignorance.

For the last two thousand years, Jews have almost invariably existed as small, relatively weak minorities living in the lands of others, whether Christian or Muslim, so a religious doctrine so unswervingly hostile to outsiders has naturally presented considerable obstacles for peaceful co-existence. The solution to this dilemma has been based on the divine mandate to preserve Jewish life and well-being above all else, superseding almost all other religious considerations. Thus, if any of the behaviors discussed above are considered likely to stir up resentment from powerful Gentile groups and put Jews at risk, they must be avoided.

For example, the prohibition against Jewish physicians treating the illnesses of non-Jews is waived in the case of powerful non-Jews, especially national leaders, whose favor might provide benefits to the Jewish community. And even ordinary non-Jews may be aided unless some persuasive excuse can be found to explain such lack of assistance since otherwise the vengeful hostility of their friends and relatives might cause difficulties for other Jews. Similarly, it is permissible to exchange gifts with non-Jews but only if such behavior can be justified in strictly utilitarian terms, with any simple expression of friendship towards a non-Jew being a violation of holy principles.

If the Gentile population became aware of these Jewish religious beliefs and the behaviors they promote, major problems for Jews might develop, so an elaborate methodology of subterfuge, concealment, and dissimulation has come into being over the many centuries to minimize this possibility, especially including the mistranslation of sacred texts or the complete exclusion of crucial sections. Meanwhile, the traditional penalty for any Jew who "informs" to the authorities on any matter regarding the Jewish community has always been death, often preceded by hideous torture.

Much of this dishonesty obviously continues down to recent times since it seems very unlikely that Jewish rabbis, except perhaps for those of the most *avant garde* disposition, would remain totally unaware of the fundamental tenets of the religion that they claim to lead, and Shahak is scathing toward their apparent self-serving hypocrisy, especially those who publicly express strongly liberal views. For example, according to mainstream Talmudic doctrine, black Africans are traditionally placed somewhere between people and monkeys in their intrinsic nature, and surely all rabbis, even liberal ones, would be aware of this religious doctrine. But Shahak notes that the numerous American rabbis who so eagerly worked with Martin Luther King, Jr. and other black Civil Rights leaders during the 1950s and 1960s strictly concealed their religious beliefs while denouncing

American society for its cruel racism, presumably seeking to achieve a political *quid pro quo* beneficial to Jewish interests with America's substantial black population.

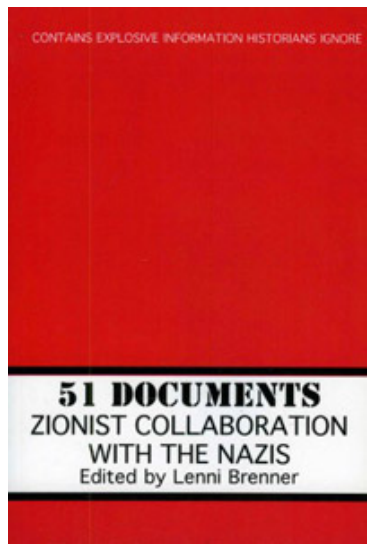
Shahak also emphasizes the utterly totalitarian nature of traditional Jewish society, in which rabbis held the power of life and death over their congregants, and often sought to punish ideological deviation or heresy using those means. They were often outraged that this became difficult as states grew stronger and increasingly prohibited such private executions. Liberalizing rabbis were sometimes murdered and Baruch Spinoza, the famous Jewish philosopher of the Age of Reason, only survived because the Dutch authorities refused to allow his fellow Jews to kill him.

Given the complexity and exceptionally controversial nature of this subject matter, I would urge readers who find this topic of interest to spend three or four hours reading Shahak's very short book, and then decide for themselves whether his claims seem plausible and whether I may have inadvertently misunderstood them. Aside from the copies on Amazon, the work may also be found at Archive.org and a very convenient HTML copy is also freely available on the Internet.

My encounter a decade ago with Shahak's candid description of the true doctrines of traditional Judaism was certainly one of the most world-altering revelations of my entire life. But as I gradually digested the full implications, all sorts of puzzles and disconnected facts suddenly became much more clear. There were also some remarkable ironies, and not long afterward I joked to a (Jewish) friend of mine that I'd suddenly discovered that Nazism could best be described as "Judaism for Wimps" or perhaps Judaism as practiced by Mother Teresa of Calcutta.

There may actually be a deeper historical truth behind that irony. I think I've read here and there that some scholars believe that Hitler may have modeled certain aspects of his racially-focused National Socialist doctrine upon the Jewish example, which really makes perfect sense. After all, he saw that despite their small numbers Jews had gained enormous power in the Soviet Union, Weimar Germany, and numerous other countries throughout Europe, partly due to their extremely strong ethnic cohesion, and he probably reasoned that his own Germanic people, being far greater in numbers and historical achievements could do even better if they adopted similar practices.

It's also interesting to note that quite a number of the leading racialist pioneers of 19th century Europe came from a particular ethnic background. For example, my history books had always disapprovingly mentioned Germany's Max Nordau and Italy's Cesare Lombroso as two of the founding figures of European racism and eugenics theories, but it was only very recently that I discovered that Nordau had also been the joint founder with Theodor Herzl of the world Zionist movement, while his major racialist treatise *Degeneration*, was dedicated to Lombroso, his Jewish mentor.



Even as late as the 1930s and afterward, international Zionist groups closely cooperated with the Third Reich on their economic projects, and during the world war itself one of the smaller rightwing factions, led by future Israeli Prime Minister Yizhak Shamir, actually offered a military alliance to the Axis Powers, denouncing the decadent Western democracies and hoping to collaborate against their mutual British enemies. *The Transfer Agreement* by Edwin Black, *51 Documents* by Lenni Brenner, and other writings have documented all these facts in detail, though for obvious reasons they have generally been ignored or mischaracterized by most of our media outlets.

Obviously the Talmud is hardly regular reading among ordinary Jews these days, and I would suspect that except for the strongly Orthodox and perhaps most rabbis, barely a sliver are aware of its highly controversial teachings. But it is important to keep in mind that until just a few generations ago, almost all European Jews were deeply Orthodox, and even today I would guess that the overwhelming

majority of Jewish adults had Orthodox grand-parents. Highly distinctive cultural patterns and social attitudes can easily seep into a considerably wider population, especially one that remains ignorant of the origin of those sentiments, a condition enhancing their unrecognized influence. A religion based upon the principal of "Love Thy Neighbor" may or may not be workable in practice, but a religion based upon "Hate Thy Neighbor" might have long-term cultural ripple effects that extend far beyond the direct community of the deeply pious. If nearly all Jews for a thousand or two thousand years were taught to feel a seething hatred toward all non-Jews and also developed an enormous infrastructure of cultural dishonesty to mask that attitude, it is difficult to believe that such an unfortunate history has had absolutely no consequences for our present-day world, or that of the relatively recent past.

Furthermore, Jewish hostility toward non-Jews may often have served the interests of others, and helped determine the economic role that the group filled, especially in European countries, with this factor having been obscured by widespread ignorance of the underlying religious tenets. As most of us know from our history books, political rulers with little sympathy for their subjects sometimes restrict military power to a relatively small group of well-rewarded mercenaries, often of foreign origins so that they will have little sympathy for the population they harshly repress. I strongly suspect that some of the most common traditional economic niches of European Jews, such as tax-farming and the *arrenda* estate-management system of Eastern Europe, should be best understood in a similar light, with Jews being more likely to extract every last penny of value from the peasants they controlled for the benefit of their local king or lords, and their notorious antipathy for all non-Jews ensuring that such behavior was minimally tempered by any human sympathy. Thus, we should not be surprised that Jews first entered England in the train of William the Conqueror, in order to help him and his victorious Norman lords effectively exploit the subjugated Anglo-Saxon population they now ruled.

But states in which the vast majority of the population is oppressed and dominated by a thin slice of rulers and their mercenary enforcers tend to be much weaker and more brittle than those in which rulers and ruled share common interests, and I believe this is just as true for economic enforcers as for military ones. In many cases, lands reliant upon Jewish economic intermediaries, notably Poland, never successfully developed a native middle class, and often later fared quite poorly against their nationally-unified competitors. Spain was actually one of the last countries in Europe to expel its Jews, and over

the next century or two reached the peak of its military and political glory. Prof. Kevin MacDonald's controversial books on Judaism have also extensively argued that rulers who seem to have been more concerned for the well-being of their subjects also tend to be the ones more likely to be labeled "anti-Semitic" in modern history books, and his volumes are now easily available in my selection of HTML Books:

- A People That Shall Dwell Alone
  *Judaism as a Group Evolutionary Strategy*
  Kevin MacDonald • 1994 • 168,000 Words

- Separation and Its Discontents
  *Toward an Evolutionary Theory of Anti-Semitism*
  Kevin MacDonald • 1998 • 168,000 Words

In 2009, Gene Expression blogger Razib Khan interviewed eminent evolutionary theorist David Sloan Wilson on the group selection ideas that have been his major focus. During this hour-long discussion, the theories of MacDonald became a major topic, with Wilson seeming to take them quite seriously, and pointing out that within the scientific framework "parasitism" has a simple technical definition, namely the exploitation of the large by the small. Unsurprisingly, the video record of such extremely touchy subject matter was quickly truncated to just the first 11 minutes, and eventually completely removed from both YouTube and BloggingHeadsTV. But it still at least partially survives in archived form:

In recent years, the history of Jewish expulsions from various European societies over the last thousand years has received considerable attention. The total number is somewhat disputed but almost certainly in excess of 100, with the 1930s policies of Hitler's Germany being merely the most recent example, and *Wired Magazine* provided an interesting graphical presentation of this large dataset in 2013. Given these unfortunate facts, it may be difficult to point to any other group so consistently at bitter odds with its local neighbors, and the religious details provided by Shahak certainly make this remarkable historical pattern far less inexplicable.

A very even-handed but candid description of the behavior pattern of Jewish newcomers to America was provided in a chapter of a 1914 book on immigration groups by E.A. Ross, one of America's greatest early sociologists. Ross had been one of the towering Progressive intellectuals of his era, widely quoted by Lothrop Stoddard on the Right while still so highly regarded by the Left that he was named to the Dewey Commission to adjudicate the conflicting accusations of Trotsky and Stalin and also received glowing praise in the pages of the Communist *New Masses*. His dismissal on political grounds from Stanford University led to the formation of the American Association of University Professors. Yet his name had so totally vanished from our history books I had never even encountered it until beginning work on my content-archiving project, and I would not be surprised if

that single chapter from one of his many books played a major role in his disappearance.

The Secret Relationship Between Blacks and Jews
Volume One
The Nation of Islam
Negroes at Auction
BY J. & L. T. LEVIN
WILL be sold, on MONDAY, the 31 January next, at the Court House, at 10 o'clock,
22 LIKELY NEGROES, the larger number of which are young and desirable. Among them are Field Hands, Hostlers and Carriage Drivers, House Servants, &c., and of the following ages. Robinson 39, Elsey 31, Yanaky 13, Sylla 11, Anker 8, Robinson 6, Candy 3, Infant 9, Thomas 35, Die 30, Amey 18, Eldridge 17, Charles 6, Sarah 50, Baket 50, Mary 18, Betty 16, Guy 12, Tilla 9, Lydia 24, Rachel 4, Seppio 2.
The above Negroes are sold for the purpose of making some other investment of the proceeds, the sale will therefore be positive.
Terms – a credit of one, two and three years, for notes payable at either of the Banks, with two or more approved endorsers, with interest from date. Purchasers to pay for papers.

Jews spent two thousand years living as a diaspora people, and their tightly-bound trans-national colonies provided them with a uniquely effective international trading network. Since their religious traditions regarded slavery as the natural and appropriate lot of all non-Jews, both ideological and practical factors combined to apparently make them some of the leading slave-traders of Medieval Europe, though this is hardly emphasized in our histories. Closer to home, in 1991 the Black Nationalists of The Nation of Islam published *The Secret Relationship Between Blacks and Jews, Volume One*, which seemed to persuasively document the enormous role Jews had played in the American slave-trade. In 1994, Harold Brackman published a short attempted rebuttal entitled *Ministry of Lies* under the auspices of the Simon Wiesenthal Center, but I found his denials much less compelling. I very much doubt that most Americans are aware of these historical facts.

Throughout most of my life, Nobel Laureate Alexander Solzhenitsyn was generally regarded as the greatest Russian literary figure of our modern era, and after reading all of his works, including *The First Circle*, *Cancer Ward,* and *The Gulag Archipelago*, I certainly concurred

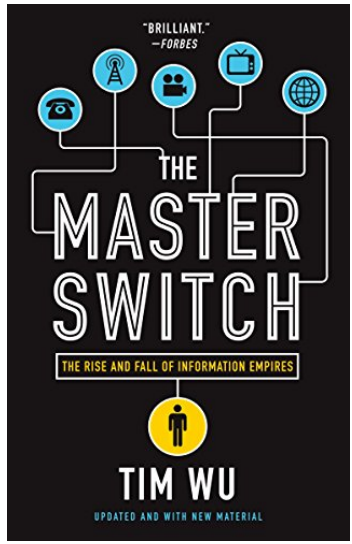
with this assertion, and eagerly absorbed Michael Scammel's brilliant thousand page biography. Although Russian himself, many of his closest friends were Jewish, but during the 1980s and 1990s, whispers of his supposed anti-Semitism began floating around, probably because he had sometimes hinted at the very prominent role of Jews in both financing and leading the Bolshevik Revolution, and afterward staffing the NKVD and administering the Gulag labor camps. Late in his life, he wrote a massive two-volume history of the tangled relationship between Jews and Russians under the title *Two Hundred Years Together*, and although that work soon appeared in Russian, French, and German, after nearly two decades, no English translation has ever been authorized. His literary star also seems to have greatly waned in America since that time, and these days I only very rarely see his name mentioned in any of my regular newspapers.

Samizdat versions of major sections of his final work may easily be located on the Internet, and a few years ago Amazon temporarily sold a 750 page hard copy edition, which I ordered and lightly skimmed. Everything seemed quite innocuous and factual, and nothing new jumped out at me, but perhaps the documentation of very heavy Jewish role in Communism was considered inappropriate for American audiences, as was the discussion of the extremely exploitative relationship between Jews and Slavic peasants in pre-revolutionary times, based on liquor-dealing and money-lending, which the Czars had often sought to mitigate.

When a ruling elite only has a limited connection to the population it controls, benevolent behavior is far less likely to occur, and those problems are magnified when that elite has a long tradition of ruthlessly extractive behavior. Enormous numbers of Russians suffered and died in the aftermath of the Bolshevik Revolution, and given the overwhelmingly Jewish composition of the top leadership during much of that period, it is hardly surprising that "anti-Semitism" was deemed a capital offense. Kevin MacDonald may have been the one who coined the term "hostile elite," and discussed the unfortunate consequences when a country comes under such control.

After the collapse of the Soviet Union in 1991, reborn Russia soon fell under the overwhelming domination of a small group of Oligarchs, almost entirely of Jewish background, and a decade of total misery and impoverishment for the general Russian population soon followed. But once an actual Russian named Vladimir Putin regained control, these trends reversed and the lives of Russians have enormously improved since that time. America's media organs were overwhelmingly friendly toward Russia when it was under Jewish

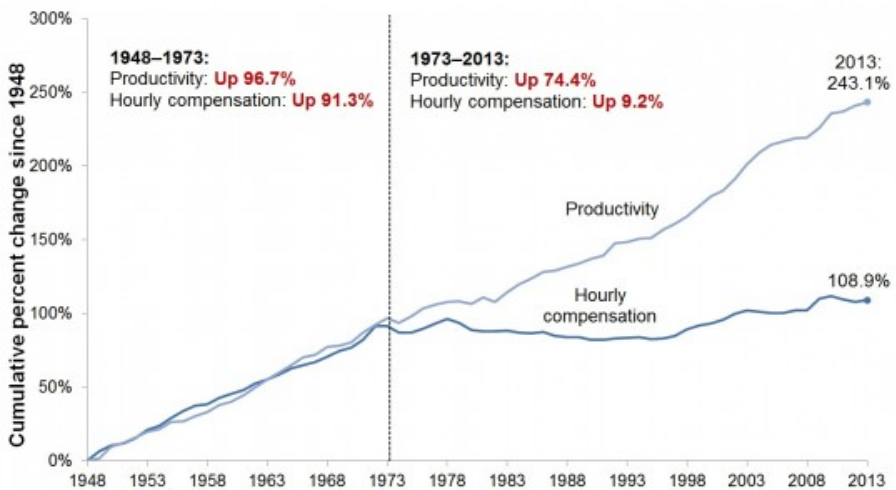
Oligarchic rule, while Putin has been demonized in the press more ferociously than any world leader since Hitler. Indeed, our media pundits regularly identify Putin as “the new Hitler” and I actually think the analogy might be a reasonable one, but just not in the way they intend.



Sometimes it is much easier to notice obvious patterns in a foreign country than in one’s own. In the early 2000s I read *The Master Switch*, a widely-praised history of modern communications technology by Columbia University professor Tim Wu, who has subsequently become a leading Internet-rights activist. I found the account fascinating, with so many stories never before known to me. However, I couldn’t help but notice that all the powerful mass-media technologies of our modern world–film, radio, and television–had been invented and pioneered by Gentiles, mostly of Anglo-Saxon origin, but in each case control was seized by ruthless Jewish businessmen, who sometimes destroyed the lives and careers of those creators. By the 1950s, nearly all of America’s leading concentrations of electronic media power—with the sole major exception of Disney Studios—were solidly in Jewish hands. In an open society such as ours, these are the central levers of political influence, and over the next generation or so, America’s long-dominant and heavily Anglo-Saxon ruling elite was replaced by a mostly Jewish one, a development I alluded to in my long Meritocracy article of a few years ago.

Critics today of all backgrounds bemoan the total impoverishment of so much of America’s once comfortably affluent middle class, noting that some sixty percent of the American population today possesses

less than $500 in readily available savings. A younger generation has been reduced to permanent debt-servitude by ruinous student loans, while the the newspapers report that the opioid drug epidemic has claimed a dreadful toll in lives and family-breakdown even while Wall Street and other elite sectors of the financialized economy are richer than they have ever been before. There are certainly many different explanations for this sad economic trajectory, including technological change, growing international competition, and shifts of political power in the American system of government. But it does sometimes seem like a substantial fraction of our population has been reduced to a 21st century version of the drunken, ignorant, exploited, indebted, impoverished, and immiserated Slavic peasantry of the Jewish-dominated Pale of Settlement, and a striking graph produced by the Economic Policy Institute demonstrates that a very sharp economic inflection point occurred in the early 1970s, right around the time that the aforementioned ethnic transformation of our ruling elites was fully under way.



Contrary to widespread popular belief, it is not actually illegal to be a "Nazi" in America, nor are Nazis prohibited from owning property, even including media outlets. But suppose that the overwhelming majority of America's major media concentrations were owned and controlled by Nazis of a particularly fanatical type. Surely that might have serious consequences for the course of our society, and especially that fraction of the population viewed with considerable disfavor under Nazi doctrine.

One important point to consider in the abbreviated history of Hitler's Third Reich was that although the ruling Nazi elite was often quite

harsh and extreme in its behavior, well over 98% of the population it ruled prior to the outbreak of war consisted of Germans, the particular group which that ruling elite most sought to benefit and uplift in all possible ways, and despite the obscuring cloud of retrospective propaganda, this goal seems to have largely been achieved. In 2004, *Counterpunch* published a column by the late Alexander Cockburn, its redoubtable editor, noting the tremendous success of Hitler's peacetime economic policies, and in 2013 that same webzine carried a much longer column focused entirely on this same subject, citing the analysis of Henry C.K. Liu, whose Chinese background provided him greater critical distance. Indeed, during most of the 1930s Hitler received widespread international praise for the great success of his domestic economic and social achievements, making the cover of *Time Magazine* on numerous occasions and even being named its Man of the Year for 1938. By contrast, I suspect that a population that was some 98% non-German but ruled by those same fanatically pro-German leaders might have fared far worse.

Most of these disheartening facts that have so completely upended my understanding of reality over the last decade could not possibly have come to my attention until the rise of the Internet, which partially broke centralized control over the distribution of information. But many other people must surely have known large portions of this important story long before that, and recognized the very serious consequences these matters might have for the future of our society. Why has there been so little public discussion?

I believe one factor is that over the years and the decades, our dominant media organs of news and entertainment have successfully conditioned most Americans to suffer a sort of mental allergic reaction to topics sensitive to Jews, which leads to all sorts of issues being considered absolutely out of bounds. And with America's very powerful Jewish elites thereby insulated from almost all public scrutiny, Jewish arrogance and misbehavior remain largely unchecked and can increase completely without limit.

I've also sometimes suggested to people that one under-emphasized aspect of a Jewish population, greatly magnifying its problematical character, is the existence of what might be considered a biological sub-morph of exceptionally fanatical individuals, always on hair-trigger alert to launch verbal and sometimes physical attacks of unprecedented fury against anyone they regard as insufficiently friendly towards Jewish interests. Every now and then, a particularly brave or foolhardy public figure challenges some off-limits topic and is almost always overwhelmed and destroyed by a veritable swarm of

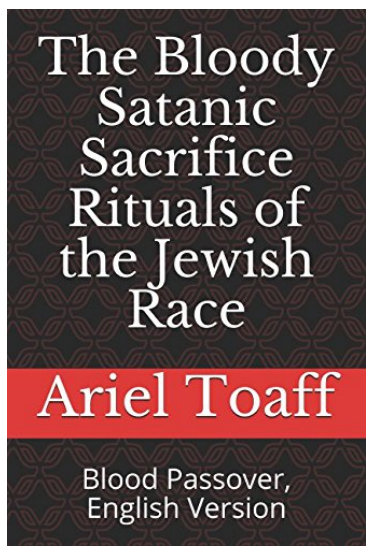
these fanatical Jewish attackers. Just as the painful stings of the self-sacrificing warrior caste of an ant colony can quickly teach large predators to go elsewhere, fears of provoking these "Jewish berserkers" can often severely intimidate writers or politicians, causing them to choose their words very carefully or even completely avoid discussing certain controversial subjects, thereby greatly benefiting Jewish interests as a whole. And the more such influential people are thus intimidated into avoiding a particular topic, the more that topic is perceived as strictly taboo, and avoided by everyone else as well.

For example, about a dozen years ago I was having lunch with an especially eminent Neoconservative scholar with whom I'd become a little friendly. We were bemoaning the overwhelmingly leftward skew among America's intellectual elites, and I suggested it largely seemed a function of our most elite universities. Many of our brightest students from across the nation entered Harvard and the other Ivies holding a variety of different ideological perspectives, but after four years departed those halls of learning overwhelmingly in left-liberal lock-step. Although he agreed with my assessment, he felt I was missing something important. He nervously glanced to both sides, shifted his head downward, and lowered his voice. "It's the Jews," he said.

I do not doubt that much of the candid analysis provided above will be quite distressing to many individuals. Indeed, some may believe that such material far exceeds the boundaries of mere "anti-Semitism" and easily crosses the threshold into constituting an actual "blood libel" against the Jewish people. That extremely harsh accusation, widely used by stalwart defenders of Israeli behavior, refers to the notorious Christian superstition, prevalent throughout most of the Middle Ages and even into more modern times, that Jews sometimes kidnapped small Christian children in order to drain their blood for use in various magic rituals, especially in connection with the Purim religious holiday. One of my more shocking discoveries of the last dozen years is that there is a fairly strong likelihood that these seemingly impossible beliefs were actually true.

I personally have no professional expertise whatsoever in Jewish ritual traditions, nor the practices of Medieval Jewry. But one of the world's foremost scholars in that field is Ariel Toaff, professor of Jewish Renaissance and Medieval Studies at Bar-Ilan University near Tel Aviv, and himself the son of the Chief Rabbi of Rome.

In 2007, he published the Italian edition of his academic study *Blood Passovers*, based on many years of diligent research, assisted by his graduate students and guided by the suggestions of his various academic colleagues, with the initial print run of 1,000 copies selling out on the first day. Given Toaff's international eminence and such enormous interest, further international distribution, including an English edition by a prestigious American academic press would normally have followed. But the ADL and various other Jewish-activist groups regarded such a possibility with extreme disfavor, and although these activists lacked any scholarly credentials, they apparently applied sufficient pressure to cancel all additional publication. Although Prof. Toaff initially attempted to stand his ground in stubborn fashion, he soon took the same course as Galileo, and his apologies naturally became the basis of the always-unreliable Wikipedia entry on the topic.



Eventually, an English translation of his text turned up on the Internet in a PDF format and was also placed for sale on Amazon.com, where I purchased a copy and eventually read it. Given those difficult circumstances, this work of 500 pages is hardly in ideal form, with most of the hundreds of footnotes disconnected from the text, but it still provides a reasonable means of evaluating Toaff's controversial thesis, at least from a layman's perspective. He certainly seems an extremely erudite scholar, drawing heavily upon the secondary literature in English, French, German, and Italian, as well as the original documentary sources in Latin, Medieval Latin, Hebrew, and Yiddish. Indeed, despite the shocking nature of the subject matter, this scholarly work is actually rather dry and somewhat dull, with very

long digressions regarding the particular intrigues of various obscure Medieval Jews. My own total lack of expertise in these areas must be emphasized, but overall I thought Toaff made a quite persuasive case.

It appears that a considerable number of Ashkenazi Jews traditionally regarded Christian blood as having powerful magical properties and considered it a very valuable component of certain important ritual observances at particular religious holidays. Obviously, obtaining such blood in large amounts was fraught with considerable risk, which greatly enhanced its monetary value, and the trade in the vials of that precious commodity seems to have been widely practiced. Toaff notes that since the detailed descriptions of the Jewish ritualistic murder practices are very similarly described in locations widely separated by geography, language, culture, and time period, they are almost certainly independent observations of the same rite. Furthermore, he notes that when accused Jews were caught and questioned, they often correctly described obscure religious rituals which could not possibly have been known to their Gentile interrogators, who often garbled minor details. Thus, these confessions were very unlikely to have been concocted by the authorities.

Furthermore, as extensively discussed by Shahak, the world-view of traditional Judaism did involve a very widespread emphasis on magical rituals, spells, charms, and similar things, providing a context in which ritualistic murder and human sacrifice would hardly be totally unexpected.

Obviously, the ritual murder of Christian children for their blood was viewed with enormous disfavor by the local Gentile population, and the widespread belief in its existence remained a source of bitter tension between the two communities, flaring up occasionally when a Christian child mysteriously disappeared at a particular time of year, or when a body was found that exhibited suspicious types of wounds or showed a strange loss of blood. Every now and then, a particular case would reach public prominence, often leading to a political test of strength between Jewish and anti-Jewish groups. During the mid-19th century, there was one such famous case in French-dominated Syria, and just before the outbreak of the First World War, Russia was wracked by a similar political conflict in the 1913 Beilis Affair in the Ukraine.

I first encountered these very surprising ideas almost a dozen years ago in a long article by Israel Shamir that was referenced in *Counterpunch*, and this would definitely be worth reading as an overall summary, together with a couple of his follow-up columns, while

writer Andrew Hamilton offers the most recent 2012 overview of the controversy. Shamir also helpfully provides a free copy of the book in PDF form, an updated version with the footnotes properly noted in the text. Anyway, I lack the expertise to effectively judge the likelihood of the Toaff Hypothesis, so I would invite those interested to read Toaff's book or better yet the related articles and decide for themselves.

The notion that the world is not only stranger than we imagine, it is stranger than we can imagine has often been misattributed to the British astronomer Sir Arthur Eddington, and over the last fifteen-odd years I've sometimes begun to believe that the historical events of our own era could be considered in a similar light. I've also sometimes joked with my friends that when the true history of our last one hundred years is finally written and told—probably by a Chinese professor at a Chinese university—none of the students in his lecture hall will ever believe a word of it.

# The Bolshevik Revolution and Its Aftermath

July 23, 2018 • 6,900 Words

Although I always had a great interest in history, I naively believed what I read in my textbooks, and therefore regarded American history as just too bland and boring to study.

By contrast, one land I found especially fascinating was China, the world's most populous country and its oldest continuous civilization, with a tangled modern history of revolutionary upheaval, then suddenly reopened to the West during the Nixon Administration and under Deng's economic reforms starting to reverse decades of Maoist economic failure.

In 1978 I took a UCLA graduate seminar on the rural Chinese political economy, and probably read thirty or forty books during that semester. E.O. Wilson's seminal *Sociobiology: The New Synthesis* had just been published a couple of years earlier, reviving that field after decades of harsh ideological suppression, and with his ideas in the back of my mind, I couldn't help noticing the obvious implications of the material I was reading. The Chinese had always seemed a very smart people, and the structure of China's traditional rural peasant economy produced Social Darwinist selective pressure so thick that you could cut it with a knife, thus providing a very elegant explanation of how the Chinese got that way. A couple of years later in college, I wrote up my theory while studying under Wilson, and then decades afterward dug it out again, finally publishing my analysis as How Social Darwinism Made Modern China.

With the Chinese people clearly having such tremendous inherent talent and their potential already demonstrated on a much smaller scale in Hong Kong, Taiwan, and Singapore, I believed there was an excellent chance that Deng's reforms would unleash enormous economic growth, and sure enough, that was exactly what happened. In the late 1970s, China was poorer than Haiti, but I always told my friends that it might come to dominate the world economically within a couple of generations, and although most of them were initially quite skeptical of such an outrageous claim, every few years they became a little less so. For years *The Economist* had been my favorite magazine, and in 1986 they published an especially long letter of

mine emphasizing the tremendous rising potential of China and urging them to expand their coverage with a new Asia Section; the following year, they did exactly that.

These days I feel tremendous humiliation for having spent most of my life being so totally wrong about so many things for so long, and I cling to China as a very welcome exception. I can't think of a single development during the last forty years that I wouldn't have generally expected back in the late 1970s, with the only surprise having been the total lack of surprises. About the only "revision" I've had to make in my historical framework is that I'd always casually accepted the ubiquitous claim that Mao's disastrous Great Leap Forward of 1959-61 had caused 35 million or more deaths, but I've recently encountered some serious doubts, suggesting that such a total could be considerably exaggerated, and today I might admit the possibility that only 15 million or fewer had died.

But although I always had a great interest in China, European history was even more fascinating to me, with the political interplay of so many conflicting states and the huge ideological and military upheavals of the twentieth century.

In my unjustified arrogance, I also sometimes relished a sense of seeing obvious things that magazine or newspaper journalists got so completely wrong, mistakes which often slipped into historical narratives as well. For example, discussions of the titanic 20th century military struggles between Germany and Russia quite often made casual references to the traditional hostility between those two great peoples, who for centuries had stood as bitter rivals, representing the eternal struggle of Slav against Teuton for dominion over Eastern Europe.

Although the bloodstained history of the two world wars made that notion seem obvious, it was factually mistaken. Prior to 1914, those two great peoples had not fought against each other for the previous 150 years, and even the Seven Years' War of the mid-18th century had involved a Russian alliance with Germanic Austria against Germanic Prussia, hardly amounting to a conflict along civilizational lines. Russians and Germans had been staunch allies during the endless Napoleonic wars and closely cooperated during the Metterich and Bismarck eras that followed, while even as late as 1904, Germany had supported Russia in its unsuccessful war against Japan. During the 1920s, Weimar Germany and Soviet Russia had a period of close

military cooperation, the Hitler-Stalin Pact of 1939 marked the beginning of the Second World War, and throughout the long Cold War, the USSR had no more loyal a satellite than East Germany. Perhaps two dozen years of hostility over the last three centuries, with good relations or even outright alliance during most of the remainder, hardly suggested that Russians and Germans were hereditary enemies.

Moreover, during much of that period, Russia's ruling elite had had a considerable Germanic tinge. Russia's legendary Catherine the Great had been a German princess by birth, and over the centuries so many Russian rulers had taken German wives that the later Czars of the Romanov dynasty were usually more German than Russian. Russia itself had a substantial but heavily assimilated German population, which was very well represented in elite political circles, with German names being quite common among government ministers and sometimes found among important military commanders. Even a top leader of the Decembrist revolt of the early 19th century had had German ancestry but was a zealous Russian-nationalist in his ideology.

Under the governance of this mixed Russian and German ruling class, the Russian Empire had steadily risen to become one of the world's foremost powers. Indeed, given its vast size, manpower, and resources, combined with one of the fastest economic growth rates and a natural increase in total population that was not far behind, a 1914 observer might have easily pegged it to soon dominate the European continent and perhaps even much of the world, just as Tocqueville had famously prophesized in the early decades of the 19th century. A crucial underlying cause of the First World War was Britain's belief that only a preventative war could forestall a rising Germany, but I suspect that an important secondary cause was the parallel German notion that similar measures were necessary against a rising Russia.

Obviously, this entire landscape was totally transformed by the Bolshevik Revolution of 1917, which swept the old order from power, massacring much of its leadership and forcing the remainder to flee, thereby ushering in the modern world era of ideological and revolutionary regimes. I grew up during the final decades of the long Cold War, when the Soviet Union stood as America's great international adversary, so the history of that revolution and its aftermath always fascinated me. During college and graduate school I probably read at least one hundred books in that general topic, devouring the brilliant works of Solzhenistyn and Sholokhov, the thick historical volumes of mainstream academic scholars such as Adam Ulam and Richard Pipes, as well as the writings of leading Soviet dissidents such as Roy Medvedev, Andrei Sakharov, and Andrei

Amalrik. I was fascinated by the tragic story of how Stalin outmaneuvered Trotsky and his other rivals, leading to the massive purges of the 1930s as Stalin's growing paranoia produced such gigantic loss of life.

I was not so totally naive that I did not recognize some of the powerful taboos surrounding discussion of the Bolsheviks, particularly regarding their ethnic composition. Although most of the books hardly emphasized the point, anyone with a careful eye for the occasional sentence or paragraph would surely know that Jews were enormously over-represented among the top revolutionaries, with three of Lenin's five potential successors— Trotsky, Zinoviev, and Kamenev—all coming from that background, along with many, many others within the top Communist leadership. Obviously, this was wildly disproportionate in a country having a Jewish population of perhaps 4%, and surely helped explain the large spike in worldwide hostility towards Jews soon afterward, which sometimes took the most deranged and irrational forms, such as the popularity of *The Protocols of the Learned Elders of Zion* and Henry Ford's notorious publication of *The International Jew*. But with Russian Jews so much more likely to be educated and urbanized, and suffering from fierce anti-Semitic oppression under the Czars, everything seemed to make reasonable sense.

Then perhaps fourteen or fifteen years ago, I encountered a rip in my personal space-time continuum, among the first of many to come.

In this particular instance, an especially rightwing friend of evolutionary theorist Gregory Cochran had been spending long days browsing the pages of *Stormfront*, a leading Internet forum for the Far Right, and having come across a remarkable factual claim, asked me for my opinion. Allegedly Jacob Schiff, America's leading Jewish banker, had been the crucial financial supporter of the Bolshevik Revolution, providing the Communist revolutionaries with $20 million in funding.

My first reaction was that such a notion was utterly ridiculous since a fact so enormously explosive could not have been ignored by the many dozens of books I had read on the origins of that revolution. But the source seemed extremely precise. The *Knickerbocker* columnist in the February 3, 1949 edition of *The New York Journal-American*, then one of the leading local newspapers, wrote that ﷺToday it is estimated by Jacob's grandson, John Schiff, that the old man sank

about 20,000,000 dollars for the final triumph of Bolshevism in Russia.

Once I checked around a little, I discovered that numerous mainstream accounts described the enormous hostility of Schiff towards the Czarist regime for its ill-treatment of Jews, and these days even so establishmentarian a source as Wikipedia's entry on Jacob Schiff notes that he played a major role financing the Russian Revolution of 1905, as was revealed in the later memoirs of one of his key operatives. And if you run a search on "jacob schiff bolshevik revolution" numerous other references come up, representing a wide variety of different positions and degrees of credibility. One very interesting statement appears in the memoirs of Henry Wickham Steed, editor of *The Times of London* and one of the foremost international journalists of his era. He very matter-of-factly mentioned that Schiff, Warburg and the other top Jewish international bankers were among the leading backers of the Jewish Bolsheviks, through whom they hoped to gain an opportunity for the Jewish exploitation of Russia, and he described their lobbying efforts on behalf of their Bolshevik allies at the 1919 Paris Peace Conference following the end of the First World War.

Even the very recent and highly skeptical analysis in Kenneth D. Ackerman's 2016 book *Trotsky in New York, 1917* notes that U.S. Military Intelligence reports of the period directly made that astonishing claim, pointing to Trotsky as the conduit for the heavy financial backing of Schiff and numerous other Jewish financiers. In 1925 this information was published in the British *Guardian* and was widely discussed and accepted throughout the 1920s and 1930s by numerous major media publications, long before Schiff's own grandson provided a direct confirmation of those facts in 1949. Ackerman rather cavalierly dismisses all of this considerable contemporaneous evidence as "anti-Semitic" and a "conspiracy story," arguing that since Schiff was a notorious conservative who had never shown any sympathy for socialism in his own American milieu, he surely would not have funded the Bolsheviks.

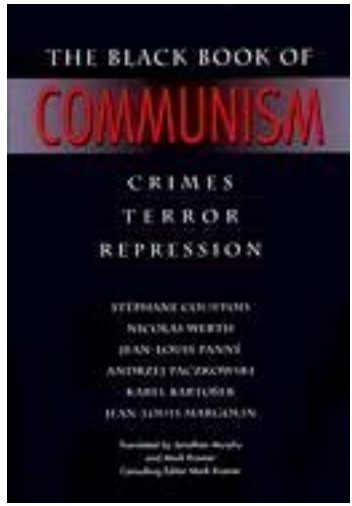
Now admittedly, a few details might easily have gotten somewhat garbled over time. For example, although Trotsky quickly became second only to Lenin in the Bolshevik hierarchy, in early 1917 the two men were still bitterly hostile over various ideological disputes, so he certainly was not then considered a member of that party. And since everyone today acknowledges that Schiff had heavily financed the failed 1905 Revolution in Russia, it seems perfectly possible that the $20 million figure mentioned by his grandson refers to the total

invested over the years supporting all the different Russian revolutionary movements and leaders, which together finally culminated in the establishment of Bolshevik Russia. But with so many seemingly credible and independent sources all making such similar claims, the basic facts appear almost indisputable.

Consider the implications of this remarkable conclusion. I would assume that most of Schiff's funding of revolutionary activities was spent on items such as stipends for activists and bribes, and adjusted for the average family incomes of that era, $20 million would be as much as $2 billion in present-day money. Surely without such enormous financial support, the likelihood of any Bolshevik victory would have been far lower, perhaps almost impossible.

When people casually used to joke about the total insanity of "anti-Semitic conspiracy theories" no better example was ever tossed around than the self-evidently absurd notion that the international Jewish bankers had created the worldwide Communist movement. And yet by any reasonable standard, this statement appears to be more or less true, and apparently was widely known at least in rough form for decades after the Russian Revolution, but had never been mentioned in any of the numerous more recent histories that shaped my own knowledge of those events. Indeed, none of these very comprehensive sources had ever even mentioned Schiff's name, although it was universally acknowledged that he had funded the 1905 Revolution, which was often discussed in enormous detail in many of those very weighty books. What other astonishing facts might they similarly be concealing?

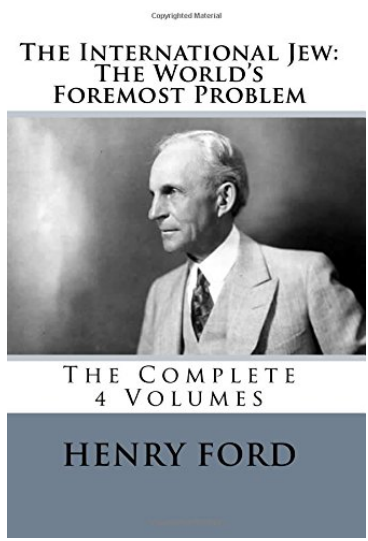
When someone encounters remarkable new revelations in an area of history in which his knowledge was rudimentary, being little more than introductory textbooks or History 101 courses, the result is a shock and an embarrassment. But when the same situation occurs in an area in which he had read tens of thousands of pages in the leading authoritative texts, which seemingly explored every minor detail, surely his sense of reality begins to crumble.



In 1999, Harvard University published the English edition of *The Black Book of Communism*, whose six co-authors devoted 850 pages to documenting the horrors inflicted upon the world by that defunct system, which had produced a total death toll they reckoned at 100 million. I have never read that book and I have often heard that the alleged body-count has been widely disputed. But for me the most remarkable detail is that when I examine the 35 page index, I see a vast profusion of entries for totally obscure individuals whose names are surely unknown to all but the most erudite specialist. But there is no entry for Jacob Schiff, the world-famous Jewish banker who apparently financed the creation of the whole system in the first place. Nor one for Olaf Aschberg, the powerful Jewish banker in Sweden, who played such an important role in providing the Bolsheviks a financial life-line during the early years of their threatened regime, and even founded the first Soviet international bank.

When one discovers a tear in the fabric of reality, there is a natural tendency to nervously peer inside, wondering what mysterious objects might dwell within. The Ackerman book denounced the notion of Schiff having funded the Bolsheviks as “a favorite trope of Nazi anti-Jewish propaganda” and just prior to those words he issued a similar denunciation of Henry Ford’s *Dearborn Independent*, a publication which once would have meant almost nothing to me. Although Ackerman’s particular book had not yet been published when I first began considering the Schiff story a dozen years ago, many other writers had similarly conjoined those two topics, so I decided to explore the matter.

Ford himself was a very interesting individual, and his world-historical role certainly received very scanty coverage in my basic history textbooks. Although the exact reasons for his decision to raise his minimum wage to $5 per day in 1914—double the existing average pay for industrial workers in America—can be disputed, it certainly seems to have played a huge role in the creation of our middle class. He also adopted a highly paternalistic policy of providing good company housing and other amenities to his workers, a total departure from the "Robber Baron" capitalism so widely practiced at that time, thereby establishing himself as a world-wide hero to industrial workers and their advocates. Indeed, Lenin himself had regarded Ford as a towering figure in the world's revolutionary firmament, glossing over his conservative views and commitment to capitalism and instead focusing on his remarkable achievements in worker productivity and economic well-being. It is a forgotten detail of history that even after Ford's considerable hostility to the Russian Revolution became widely known, the Bolsheviks still described their own industrial development policy as "Fordism." Indeed, it was not unusual to see portraits of Lenin and Ford hanging side-by-side in Soviet factories, representing the two greatest secular saints of the Bolshevik pantheon.



As for *The Dearborn Independent*, Ford had apparently launched his newspaper on a national basis not long after the end of the war, intending to focus on controversial topics, especially those related to Jewish misbehavior, whose discussion he believed was being ignored or suppressed by nearly all mainstream media outlets. I had been aware that he had long been one of the wealthiest and most highly-

regarded individuals in America, but I was still astonished to discover that his weekly newspaper, previously almost unknown to me, had reached a total national circulation of 900,000 by 1925, ranking it as the second largest in the country and by far the biggest with a national distribution. I found no easy means of examining the contents of a typical issue, but apparently the anti-Jewish articles of the first couple of years had been collected and published as short books, together constituting the four volumes of *The International Jew: The World's Foremost Problem*, a notoriously anti-Semitic work occasionally mentioned in my history textbooks. Eventually my curiosity got the best of me, so I clicked a few buttons on Amazon.com, bought the set, and wondered what I would discover.

Based on all my pre-suppositions, I expected to read some foaming-at-the-mouth screed, and doubted I would be able to get past the first dozen pages before losing interest and consigning the volumes to gather dust on my shelves. But what I actually encountered was something entirely different.

Over the last couple of decades, the enormous growth in the power of Jewish and pro-Israel groups in America has occasionally led writers to cautiously raise certain facts regarding the untoward influence of those organizations and activists, while always carefully emphasizing that the vast majority of ordinary Jews do not benefit from these policies and actually might be harmed by them, even leaving aside the possible risk of eventually provoking an anti-Jewish backlash. To my considerable surprise, I found that the material in Ford's 300,000 word series seemed to follow this exact same pattern and tone.

The individual 80 chapter-columns of Ford's volumes generally discuss particular issues and events, some of which were well-known to me, but with most totally obscured by the passage of almost a hundred years. However, as far as I could tell, almost all the discussions seemed quite plausible and factually-oriented, even sometimes overly cautious in their presentation, and with one possible exception I can't recall anything that seemed fanciful or unreasonable. As an example, there was no claim that Schiff or his fellow Jewish bankers had funded the Bolshevik Revolution since those particular facts had not yet come out, only that he had seemed to be strongly supportive of the overthrow of Czarism, and had worked toward that end for many years, motivated by what he regarded as the hostility of the Russian Empire towards its Jewish subjects. This sort of discussion is not all that different from what one might find in a modern Schiff biography or in his Wikipedia entry, though many of the important details presented in the Ford books have disappeared from the historical

record.

Although I somehow managed to plow through all four volumes of *The International Jew*, the unrelenting drum-beat of Jewish intrigue and misbehavior became somewhat soporific after a while, especially since so many of the examples provided may have loomed quite large in 1920 or 1921 but were almost totally forgotten today. Most of the content was a collection of rather monotonous complaints regarding Jewish malfeasance, scandals, or clannishness, the sort of mundane matters which might have normally appeared in the pages of an ordinary newspaper or magazine, let alone one of the muckraking type.

However, I cannot fault the publication for having such a narrow focus. A consistent theme was that because of the intimidating fear of Jewish activists and influence, virtually all of America's regular media outlets avoided discussion of any of these important matters, and since this new publication was intended to fill that void, it necessarily provided coverage overwhelmingly skewed toward that particular subject. The articles were also aimed at gradually expanding the window of public debate and eventually shaming other periodicals into discussing Jewish misbehavior. When leading magazines such as *The Atlantic Monthly* and *Century Magazine* began running such articles, this result was hailed as a major success.

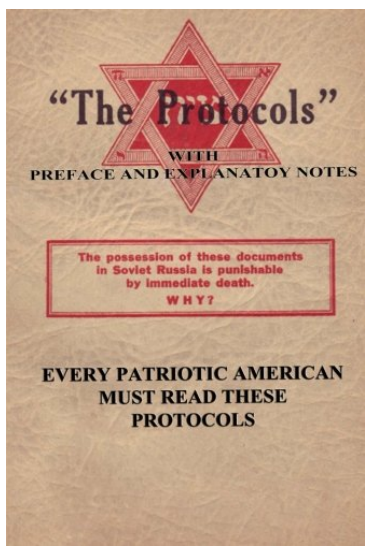
Another important goal was to make ordinary Jews more aware of the very problematical behavior of many of their community leaders. Occasionally, the publication received a letter of praise from a self-proclaimed "proud American Jew" commending the series and sometimes including a check to purchase subscriptions for other members of his community, and this achievement might become the subject of an extended discussion.

And although the details of these individual stories differed considerably from those of today, the pattern of behavior being criticized seemed remarkably similar. Change a few facts, adjust the society for a century of change, and many of the stories might be exactly the same ones that well-meaning people concerned about the future of our country are quietly discussing today. Most remarkably, there were even a couple of columns about the troubled relationship between the earliest Zionist settlers in Palestine and the surrounding native Palestinians, and deep complaints that under Jewish pressure the media often totally misreported or hid some of the outrages suffered by the latter group.

I cannot vouch for the overall accuracy of the contents of these volumes, but at the very least they would constitute an extremely valuable source of "raw material" for further historical investigation. So many of the events and incidents they recount seem to have been entirely omitted from the major media publications of that day, and certainly were never included in later historical narratives, given that even such widely known stories as Schiff's major financial backing for the Bolsheviks were completely tossed down George Orwell's "memory hole."

With the volumes long out of copyright, I have added the set to my collection of HTML Books, and those so interested may read the text and decide for themselves.

- The International Jew
  *The World's Foremost Problem*
  Henry Ford • 1920 • 323,000 Words



As mentioned, the overwhelming majority of *The International Jew* seemed a rather bland recitation of complaints about Jewish misbehavior. But there was one major exception, which has a very different impact upon our modern mind, namely that the writer took quite seriously *The Protocols of the Learned Elders of Zion.* Probably no "conspiracy theory" in modern times has been subjected to such immense vilification and ridicule as the *Protocols*, but a voyage of discovery often acquires a momentum of its own, and I became curious about the nature of that infamous document.

Apparently, the *Protocols* first came to light during the last decade of the 19th century, and the British Museum stored a copy in 1906, but it attracted relatively little attention at the time. However, all this changed after the Bolshevik Revolution and toppling of many other long-standing governments at the end of the First World War led many people to seek a common cause behind so many enormous political upheavals. From my distance of many decades, the text of the *Protocols* strikes me as rather bland and even dull, describing in rather long-winded fashion a plan of secret subversion aimed at weakening the bonds of the social fabric, setting groups against each other, gaining control over political leaders by bribery and blackmail, and eventually restoring society along rigidly hierarchical lines with an entirely new group in control. Admittedly, there were many shrewd insights into politics or psychology, notably the enormous power of the media and the benefits of advancing political front-men who were deeply compromised or incompetent and hence easily controllable. But nothing else really jumped out at me.

Perhaps one reason I found the text of the *Protocols* so uninspiring is that over the century since its publication, these notions of diabolical plots by hidden groups have become such a common theme in our entertainment media, with countless thousands of spy novels and science fiction stories presenting something similar, though these usually involve far more exciting techniques, such as a super-weapon or a powerful drug. If some Bond villain proclaimed his intent to conquer the world merely through simple political subversion, I suspect that such a film would immediately die at the box office.

But back one hundred years ago, these were apparently exciting and novel notions, and I actually found the discussion of the *Protocols* in many of the chapters of *The International Jew* far more interesting and informative than reading the text itself. The author of the Ford books appropriately treated it as any other historical document, dissecting its content, speculating on its provenance, and wondering whether or not it was what it purported to be, namely an approximate record of the statements of a group of conspirators pursuing mastery over the world, with those conspirators seeming to be an elite fraternity of international Jews.

Other contemporaries took the *Protocols* very seriously as well. The august *Times of London* fully endorsed it, before later retracting that position under heavy pressure, and I've read that more copies were published and sold in the Europe of that era than any other book save the Bible. The Bolshevik government of Russia paid the volume its own sort of deep respect, with mere possession of the *Protocols*

warranting immediate execution.

Although *The International Jew* concludes that the *Protocols* were probably genuine, I doubt that likelihood based upon the style and presentation. Browsing around on the Internet a dozen years ago, I discovered quite a variety of different opinions even within the precincts of the Far Right, where such matters were freely discussed. I remember some forum writer somewhere characterizing the *Protocols* as "based upon a true story," suggesting that someone who was generally familiar with the secretive machinations of elite international Jews against the existing governments of Czarist Russia and other countries had drafted the document to outline his view of their strategic plans, and such an interpretation seems perfectly plausible to me.

Another reader somewhere claimed that the *Protocols* were pure fiction but quite significant nonetheless. He argued that the very keen insights into the methods by which a small conspiratorial group can quietly corrupt and overthrow powerful existing regimes arguably ranked the work alongside Plato's *The Republic* and Machiavelli's *The Prince* as one of the three great classics of Western political philosophy, earning it a place on the required reading list of every Political Science 101 course. Indeed, the author of Ford's books emphasizes that there are very few mentions of Jews anywhere in the *Protocols*, and all the implied connections to Jewish conspirators could be completely struck from the text without affecting its content whatsoever.

In any event, this short work is now available as one of my HTML Books, making it quite convenient for reading and text-search.

- The Protocols of the Learned Elders of Zion
  Anonymous • 1903 • 28,000 Words

Some ideas have consequences and others do not. Although my introductory history textbooks had often mentioned Henry Ford's anti-Semitic activities, his publication of *The International Jew*, and the concurrent popularity of the *Protocols*, they never suggested any lasting political legacy, or at least I don't recall such a claim. However, once I actually read the contents and also discovered the enormous contemporary popularity of those writings and the huge national circulation of *The Dearborn Independent*, I quickly came to a very different conclusion.

For decades pro-immigration liberals, many of them Jewish, have suggested that anti-Semitism was a major factor behind the 1924 Immigration Act that drastically reduced European immigration for the next forty years, while anti-immigration activists have always heatedly denied this. The documentary evidence from that era certainly favors the position of the latter, but I really do wonder what important private discussions may not have been set down in print and entered into the *Congressional Record*. The overwhelming popular support for immigration restriction had been successfully blocked for decades by powerful business interests, which greatly benefited from the reduced wages resulting from fierce labor-competition, but now matters had suddenly changed, and surely the Bolshevik Revolution in Russia must have had been a powerful influence.

Russia, overwhelmingly populated by Russians, had been governed for centuries by a Russian ruling elite. Then, heavily Jewish revolutionaries, drawn from a group amounting to just 4% of the population had taken advantage of military defeat and unsettled political conditions to seize control of the country, butchering those previous elites or forcing them to desperately flee abroad as penniless refugees.

Trotsky and a large fraction of the leading Jewish revolutionaries had been living as exiles in New York City, and now many of their Jewish cousins still resident in America began loudly proclaiming that a similar revolution would soon follow here as well. Huge waves of recent immigration, mostly from Russia, had increased the Jewish fraction of the national population to 3%, not far below the figure for Russia itself on the eve of its revolution. If the Russian elites who ruled Russia had been suddenly overthrown by Jewish revolutionaries, is it not obvious that the Anglo-Saxon elites who ruled Anglo-Saxon America feared suffering the same fate?

The “Red Scare” of the 1919 was one response, with numerous immigrant radicals such as Emma Goldman rounded up and summarily deported. The Sacco-Vanzetti murder trial in 1921 Boston captured the attention of the nation, suggesting that other immigrant groups were violent radicals as well, and might ally themselves with the Jews in a revolutionary movement, just like the Letts and other disgruntled Russian minorities had done during the Bolshevik Revolution. But drastically reducing the inflow of these dangerous foreigners was absolutely essential since otherwise their numbers might easily grow by hundreds of thousands each year, increasing their already huge presence in our largest cities of the East Coast.

Sharply reducing immigration would certainly cause a rise in worker wages and hurt business profits. But considerations of profits are secondary if you fear that you and your family might eventually end up facing a Bolshevik firing squad or fleeing to Buenos Aires with just the clothes on your backs and a few hurriedly-packed suitcases.

A noteworthy bit of evidence in support of this analysis was the subsequent failure of Congress to enact similar restrictive legislation curtailing immigration from Mexico or the rest of Latin America. The local business interests of Texas and the Southwest argued that continuation of unrestricted Mexican immigration was important for their economic success, with Mexicans being good people, politically docile workers, and no threat to stability of the country. This was a clear contrast with the Jews and some other European immigrant groups.

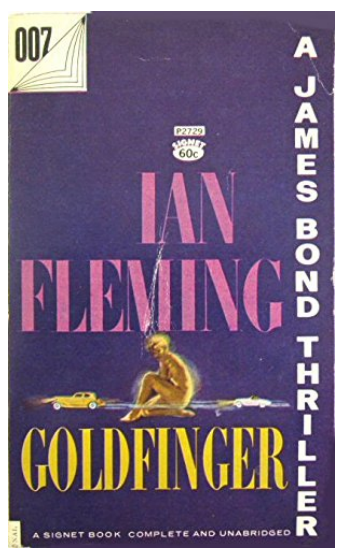
The much less familiar early 1920s battle over restricting Jewish enrollment in the Ivy League may have been another consequence. In his magisterial 2005 volume *The Chosen*, Jerome Karabel documents how the very rapid growth in Jewish numbers at Harvard, Yale, Princeton, and other Ivy League colleges had by the early 1920s become an enormous concern to the Anglo-Saxon elites which had established those institutions and always dominated their student bodies.

As a result, a quiet war over admissions broke out, involving both political and media influence, with the reigning WASPs seeking to reduce and restrict Jewish numbers and the Jews struggling to maintain or expand them. Although there seems no paper-trail of any direct references to the enormously popular national newspaper and books published by Henry Ford or any similar material, it is difficult to believe that the academic combatants were not at least somewhat aware of the theories of a Jewish assault on Gentile society then being so widely promoted. It is easy to imagine that a respectable Boston Brahmin such as Harvard President A. Lawrence Lowell regarded his own moderate “anti-Semitism” as a very reasonable middle-ground between the lurid claims promoted by Ford and others and the demands for unlimited Jewish enrollment made by his opponents. Indeed, Karabel himself points to the social impact of Ford’s publications as a significant background factor to this academic conflict.

At this point in time, the Anglo-Saxon elites still held the upper hand in the media. The very heavily Jewish film industry was only in its infancy and the same was true for radio, while the vast majority of

major print outlets were still in Gentile hands, so the descendants of America's original settlers won this round of the admissions war. But when the battle was rejoined a couple of decades later, the strategic political and media landscape had completely shifted, with Jews having achieved near-parity in print influence and overwhelming dominance in the more powerful electronic media formats such as film, radio, and nascent television, and this time they were victorious, easily breaking the hold of their longtime ethnic rivals, and eventually achieving almost complete dominance over those elite institutions.

And ironically enough, the most lasting cultural legacy of the widespread anti-Jewish agitation of the 1920s may be the least recognized. As mentioned above, modern readers might find the text of the Protocols rather boring and bland, almost like they had been cribbed from the extremely long-winded monologue of one of the diabolical villains of a James Bond story. But it wouldn't surprise me if there were actually an arrow of causality in the opposite direction. Ian Fleming created this genre in the early 1950s with his string of international best-sellers, and it is interesting to speculate about the source of his ideas.



Fleming had spent his youth during the 1920s and 1930s when the *Protocols* were among the most widely read books in much of Europe and leading British newspapers of the highest credibility were recounting the successful plots of Schiff and other international Jewish bankers to overthrow the government of Britain's Czarist ally and replace it with Jewish Bolshevik rule. Moreover, his later service in an arm of British Intelligence would surely have made him privy to

details of that history that went far beyond those public headlines. I think it is more than pure coincidence that two of his most memorable Bond villains, Goldfinger and Blofeld, had distinctly Jewish-sounding names, and that so many of the plots involve schemes of world-conquest by *Spectre*, a secretive and mysterious international organization hostile to all existing governments. The *Protocols* themselves may be half-forgotten today, but their cultural influence probably survives in the Bond films, whose $7 billion of aggregate box-office gross ranks them as the most successful movie series in history when adjusted for inflation.

The extent to which established historical facts can appear or disappear from the world should certainly force all of us to become very cautious in believing anything we read in our standard textbooks, let alone what we absorb from the more transient electronic media.

In the early years of the Bolshevik Revolution, almost no one questioned the overwhelming role of Jews in that event, nor their similar preponderance in the ultimately unsuccessful Bolshevik takeovers in Hungary and parts of Germany. For example, former British Minister Winston Churchill in 1920 denounced the "terrorist Jews" who had seized control of Russia and other parts of Europe, noting that "the majority of the leading figures are Jews" and stating that "In the Soviet institutions the predominance of Jews is even more astonishing," while lamenting the horrors these Jews had inflicted upon the suffering Germans and Hungarians.

Similarly, journalist Robert Wilton, former Russia correspondent of the *Times of London*, provided a very detailed summary of the enormous Jewish role in his 1918 book *Russia's Agony* and 1920 book *The Last Days of the Romanovs*, although one of the most explicit chapters of the latter was apparently excluded from the English language edition. Not long afterward, the facts regarding the enormous financial support provided to the Bolsheviks by international Jewish bankers such as Schiff and Aschberg were widely reported in the mainstream media.

Jews and Communism were just as strongly tied together in America, and for years the largest circulation Communist newspaper in our country was published in Yiddish. When they were finally released, the Venona Decrypts demonstrated that even as late as the 1930s and 1940s, a remarkable fraction of America's Communist spies came from that ethnic background.

A personal anecdote tends to confirm these dry historical records. During the early 2000s I once had lunch with an elderly and very eminent computer scientist, with whom I'd become a little friendly. While talking about this and that, he happened to mention that both his parents had been zealous Communists, and given his obvious Irish name, I expressed my surprise, saying that I'd thought almost all the Communists of that era were Jewish. He said that was indeed the case, but although his mother had such an ethnic background, his father did not, which made him a very rare exception in their political circles. As a consequence, the Party had always sought to place him in as prominent a public role as possible just to prove that not all Communists were Jews, and although he obeyed Party discipline, he was always irritated at being used as such a "token."

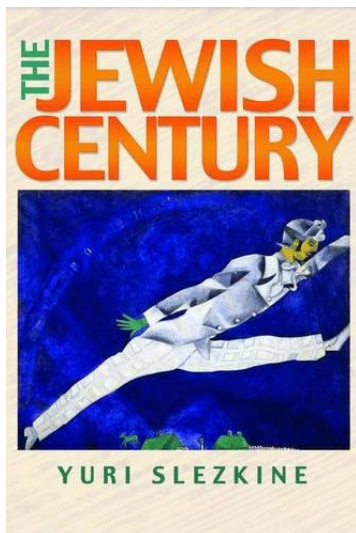
However, once Communism sharply fell out of favor in 1950s America, nearly all of the leading "Red Baiters" such as Sen. Joseph McCarthy went to enormous lengths to obscure the ethnic dimension of the movement they were combatting. Indeed, many years later Richard Nixon casually spoke in private of the difficulty he and other anti-Communist investigators had faced in trying to focus on Gentile targets since nearly all of the suspected Soviet spies were Jewish, and when this tape became public, his alleged anti-Semitism provoked a media firestorm even though his remarks were obviously implying the exact opposite.

This last point is an important one, since once the historical record has been sufficiently whitewashed or rewritten, any lingering strands of the original reality that survive are often perceived as bizarre delusions or denounced as "conspiracy theories." Indeed, even today the ever-amusing pages of Wikipedia provides an entire 3,500 word article attacking the notion of "Jewish Bolshevism" as an "antisemitic canard."

I remember in the 1970s the enormous gusts of American praise for Solzhenitysn's three volume Gulag Archipelago suddenly encountered a temporary headwind when someone noticed that his 2,000 pages had included a single photograph depicting many of the leading Gulag administrators, along with a caption revealing their unmistakably Jewish names. This detail was treated as serious evidence of the great author's possible anti-Semitism since the actual reality of the enormously large role of Jews in the NKVD and the Gulag system had long since disappeared from all the standard history books.

As another example, the Rev. Pat Robertson, a leading Christian televangelist, published *The New World Order* in 1991, his fiery attack

on the “godless globalists” whom he considered his greatest enemy, and it quickly became a massive national best-seller. He happened to include a couple of brief, somewhat garbled mentions of the $20 million which Wall Street banker Jacob Schiff had provided to the Communists, carefully avoiding any suggestion of a Jewish angle and providing no reference for that claim. His book quickly provoked a vast outpouring of denunciation and ridicule across the elite media, with the Schiff story seen as conclusion proof of Robertson’s delusional anti-Semitism. I cannot really fault these critics since in pre-Internet days they could only consult the indexes of a few standard histories of the Bolshevik Revolution, and finding no mention of Schiff or his money, naturally assumed that Robertson or his source had simply invented the bizarre story. I myself had had exactly the same reaction at the time.



Only after Soviet Communism had died in 1991 and no longer was perceived as a hostile force were academic scholars in America once again able to publish mainstream books that gradually restored the true picture of that past era. In many respects, a widely praised work such as *The Jewish Century* by Yuri Slezkine, published in 2004 by Princeton University Press, provides a narrative quite consistent with the long-forgotten works by Robert Wilton but marks a very sharp departure from the largely obfuscatory histories of the intervening eighty-odd years.

Until about a dozen years ago, I had always vaguely assumed that Henry Ford’s *The International Jew* was a work of political lunacy and the *Protocols* a notorious hoax. Yet today, I would probably consider the former as a potentially useful source of possible historical events

otherwise excluded from most standard accounts, while at least recognize why some would think the latter should deserve a place alongside Plato and Machiavelli as a great classic of Western political thought.

# The Nature of Anti-Semitism

July 30, 2018 • 5,500 Words

I recently published a couple of long essays, and although they primarily focused on other matters, the subject of anti-Semitism was a strong secondary theme. In that regard, I mentioned my shock at discovering a dozen or more years ago that several of the most self-evidently absurd elements of anti-Semitic lunacy, which I had always dismissed without consideration, were probably correct. It does seem likely that a significant number of traditionally-religious Jews did indeed occasionally commit the ritual murder of Christian children in order to use their blood in certain religious ceremonies, and also that powerful Jewish international bankers did play a large role in financing the establishment of Bolshevik Russia.

When one discovers that matters of such enormous moment not only apparently occurred but that they had been successfully excluded from nearly all of our histories and media coverage for most of the last one hundred years, the implications take some time to properly digest. If the most extreme "anti-Semitic canards" were probably true, then surely the whole notion of anti-Semitism warrants a careful reexamination.

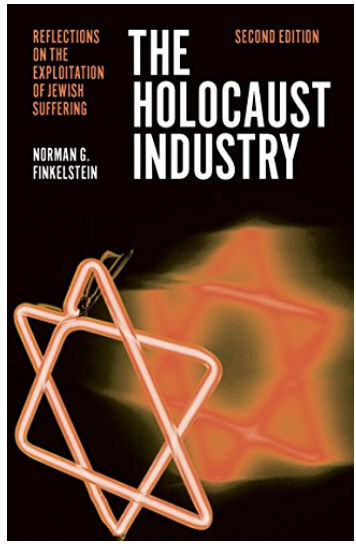
All of us obtain our knowledge of the world by two different channels. Some things we discover from our own personal experiences and the direct evidence of our senses, but most information comes to us via external sources such as books and the media, and a crisis may develop when we discover that these two pathways are in sharp conflict. The official media of the old USSR used to endlessly trumpet the tremendous achievements of its collectivized agricultural system, but when citizens noticed that there was never any meat in their shops, "Pravda" became a watchword for "Lies" rather than "Truth."

Now consider the notion of "anti-Semitism." Google searches for that word and its close variants reveal over 24 million hits, and over the years I've surely seen that term tens of thousands of times in my books and newspapers, and heard it endlessly reported in my electronic media and entertainment. But thinking it over, I'm not sure I can ever recall a single real-life instance that I've personally encountered, nor have I heard of almost any such cases from my friends or acquaintances. Indeed, the only persons I've ever come across making such claims were individuals who bore unmistakable signs of serious

psychological imbalance. When the daily newspapers are brimming with lurid tales of hideous demons walking among us and attacking people on every street corner, but you yourself have never actually seen one, you may gradually grow suspicious.

Over the years some of my own research has uncovered a sharp contrast between image and reality. As recently as the late 1990s, leading mainstream media outlets such as *The New York Times* were still denouncing a top Ivy League school such as Princeton for the supposed anti-Semitism of its college admissions policy, but a few years ago when I carefully investigated that issue in quantitative terms for my lengthy Meritocracy analysis I was very surprised to reach a polar-opposite conclusion. According to the best available evidence, white Gentiles were over 90% less likely to be enrolled at Harvard and the other Ivies than were Jews of similar academic performance, a truly remarkable finding. If the situation had been reversed and Jews were 90% less likely to be found at Harvard than seemed warranted by their test scores, surely that fact would be endlessly cited as the absolute smoking-gun proof of horrendous anti-Semitism in present-day America.

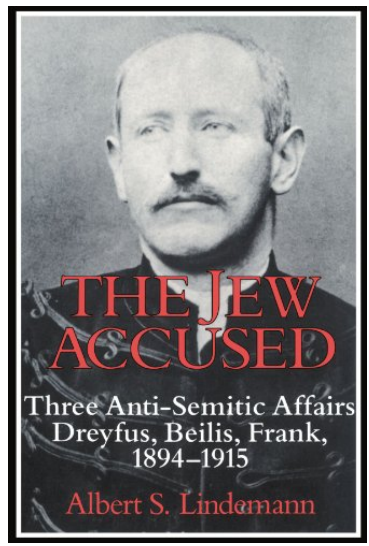
It has also become apparent that a considerable fraction of what passes for "anti-Semitism" these days seems to stretch that term beyond all recognition. A few weeks ago an unknown 28-year-old Democratic Socialist named Alexandria Ocasio-Cortez scored a stunning upset primary victory over a top House Democrat in New York City, and naturally received a blizzard of media coverage as a result. However, when it came out that she had denounced the Israeli government for its recent massacre of over 140 unarmed Palestinian protesters in Gaza, cries of "anti-Semite" soon appeared, and according to Google there are now over 180,000 such hits combining her name and that harsh accusatory term. Similarly, just a few days ago the *New York Times* ran a major story reporting that all of Britain's Jewish newspapers had issued an "unprecedented" denunciation of Jeremy Corbyn's Labour Party, describing it as an "existential threat" to the Jewish community for the anti-Semitism it was fostering; but this apparently amounted to nothing more than its willingness to sharply criticize the Israeli government for its long mistreatment of the Palestinians.



One plausible explanation of the strange contrast between media coverage and reality might be that anti-Semitism once did loom very large in real life, but dissipated many decades ago, while the organizations and activists focused on detecting and combating that pernicious problem have remained in place, generating public attention based on smaller and smaller issues, with the zealous Jewish activists of the Anti-Defamation League (ADL) representing a perfect example of this situation. As an even more striking illustration, the Second World War ended over seventy years ago, but what historian Norman Finkelstein has so aptly labeled “the Holocaust Industry” has grown ever larger and more entrenched in our academic and media worlds so that scarcely a day passes without one or more articles relating to that topic appearing in my major morning newspapers. Given this situation, a serious exploration of the true nature of anti-Semitism should probably avoid the mere media phantoms of today and focus on the past, when the condition might still have been widespread in daily life.

Many observers have pointed to the aftermath of the Second World War as marking a huge watershed in the public acceptability of anti-Semitism both in America and Europe, so perhaps a proper appraisal of that cultural phenomenon should focus on the years before that global conflict. However, the overwhelming role of Jews in the Bolshevik Revolution and other bloody Communist seizures of power quite naturally made them objects of considerable fear and hatred throughout the inter-war years, so the safest course might be to push that boundary back a little further and confine our attention to the period prior to the outbreak of the First World War. The pogroms in

Czarist Russia, the Dreyfus Affair in France, and the lynching of Leo Frank in the American South come to mind as some of the most famous examples from that period.



In 1991 Cambridge University Press published *The Jew Accused* by Albert Lindemann, a noted scholar of European ideological movements, and his book focused on exactly that era and those sorts of incidents. Although the text is quite short, running less than 300 pages, Lindemann built his discussion upon a huge foundation of secondary literature, with his footnotes drawn from the 200 works included in his extensive bibliography. As far as I could tell, he seems a very scrupulous scholar, generally providing the multiple, often conflicting accounts of a given incident, and coming to his own conclusions with considerable hesitation.

This approach is certainly demonstrated in the first of his major cases, the notorious Dreyfus affair of late 19th century France, probably one of history's most famous anti-Semitic incidents. Although he concludes that Captain Alfred Dreyfus was very likely innocent of the charge of espionage, he notes the seemingly strong evidence that initially led to his arrest and conviction and finds—contrary to myth-making by numerous later writers—absolutely no indications that his Jewish origins played any role whatsoever in his predicament.

However, he does note some of the underlying social context to this fierce political battle. Although only one Frenchman in a thousand was Jewish, just a few years earlier a group of Jews had been the

leading culprits behind several huge financial scandals that had impoverished large numbers of small investors, and the swindlers afterward escaped any punishment by means of political influence and bribery. Given this history, much of the outrage of the anti-Dreyfusards probably arose from their fears that a Jewish military spy from a very wealthy family might be able to walk free using similar tactics, and the public claims that Dreyfus's brother was offering enormous bribes to win his brother's release certainly strengthened this concern.

Lindemann's discussion of the 1913 Leo Frank Affair, in which a wealthy Northern Jew working in Atlanta was accused of sexually-assaulting and murdering a young girl, is even more interesting. Once again, he notes that contrary to the traditional narrative, there seems absolutely no hint that Frank's Jewish background played any role in his arrest or conviction. Indeed, at his trial it was instead his very highly-paid defense attorneys who unsuccessfully sought to "play the race card" with the jurors by crudely attempting to deflect suspicion upon a local black worker by means of racially-charged invective.

Although Lindemann regards Frank as probably innocent, my own reading of the evidence he presents suggests the overwhelming likelihood of his guilt. Meanwhile, it seems undeniable that the outpouring of popular anger against Frank was produced by the vast ocean of outside Jewish money—at least $15 million or more in present-day dollars—that was committed to the legal efforts to save the life of someone widely regarded as a brutal murderer. There are strong suggestions that far more improper means were also employed, including bribery and influence-peddling, so that after Frank was convicted by a jury of his peers and thirteen separate legal appeals were denied, a governor with strong personal ties to the defense lawyers and Jewish interests chose to spare Frank's life a few months before leaving office. Under these circumstances, the lynch-mob that hung Frank was viewed by the community as merely enforcing his official death sentence by extra-judicial means.

I also discovered that the leading figures in the anti-Frank movement had views far nuanced than I had expected. For example, populist writer Tom Watson had previously been a strong defender of Jewish anarchist Emma Goldman, while ferociously denouncing the Rockefellers, Morgans, and Goulds as the "true destroyers" of Jeffersonian democracy, so his outrage that Frank might escape punishment for murder seemed motivated by the extreme wealth of Frank's family and his supporters rather than any pre-existing anti-Semitic sentiments.

The unmistakable conclusion of Lindemann's analysis is that if the defendants in both the Dreyfus and Frank cases had not been Jewish, they would have suffered identical arrests and convictions, but lacking any wealthy and politically mobilized Jewish community to rally around them, they would have received their punishments, just or unjust, and immediately been forgotten. Instead, Theodor Herzl, the founding father of Zionism, later claimed that the massive anti-Semitism revealed by the Dreyfus Affair was the basis of his personal ideological awakening, while the Frank Affair led to the establishment of America's Anti-Defamation League. And both these cases have entered our history books as among the most notorious examples of pre-World War I anti-Semitism.

Lindemann's discussion of the often difficult relations between Russia's restive Jewish minority and its huge Slavic majority is also quite interesting, and he provides numerous instances in which major incidents, supposedly demonstrating the enormously strong appeal of vicious anti-Semitism, were quite different than has been suggested by the legend. The famous Kishinev Pogrom of 1903 was obviously the result of severe ethnic tension in that city, but contrary to the regular accusations of later writers, there seems absolutely no evidence of high-level government involvement, and the widespread claims of 700 dead that so horrified the entire world were grossly exaggerated, with only 45 killed in the urban rioting. Chaim Weizmann, the future president of Israel, later promoted the story that he himself and some other brave Jewish souls had personally defended their people with revolvers in hand even as they saw the mutilated bodies of 80 Jewish victims. This account was totally fictional since Weizmann happened to have been be hundreds of miles away when the riots occurred.

Although a tendency to lie and exaggerate was hardly unique to the political partisans of Russian Jewry, the existence of a powerful international network of Jewish journalists and Jewish-influenced media outlets ensured that such concocted propaganda stories might receive enormous worldwide distribution, while the truth followed far behind, if at all.

For related reasons, international outrage was often focused on the legal confinement of most of Russia's Jews to the "Pale of Settlement," suggesting some sort of tight imprisonment; but that area was the traditional home of the Jewish population and encompassed a landmass almost as large as France and Spain combined. The growing impoverishment of Eastern European Jews during that era was often

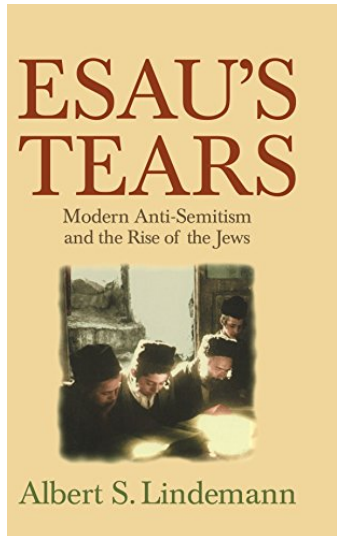
assumed to be a consequence of hostile government policy, but the obvious explanation was extraordinary Jewish fecundity, which far outstripped that of their Slavic fellow countrymen, and quickly led them to outgrow the available spots in any of their traditional "middleman" occupations, a situation worsened by their total disinclination to engage in agriculture or other primary-producer activities. Jewish communities expressed horror at the risk of losing their sons to the Czarist military draft, but this was simply the flip-side of the full Russian citizenship they had been granted, and no different from what was faced by their non-Jewish neighbors.

Certainly the Jews of Russia suffered greatly from widespread riots and mob attacks in the generation prior to World War I, and these did sometimes have substantial government encouragement, especially in the aftermath of the very heavy Jewish role in the 1905 Revolution. But we should keep in mind that a Jewish plotter had been implicated in the killing of Czar Alexander II, and Jewish assassins had also struck down several top Russian ministers and numerous other government officials. If the last decade or two had seen American Muslims assassinate a sitting U.S. President, various leading Cabinet members, and a host of our other elected and appointed officials, surely the position of Muslims in this country would have become a very uncomfortable one.

As Lindemann candidly describes the tension between Russia's very rapidly growing Jewish population and its governing authorities, he cannot avoid mentioning the notorious Jewish reputation for bribery, corruption, and general dishonesty, with numerous figures of all political backgrounds noting that the remarkable Jewish propensity to commit perjury in the courtroom led to severe problems in the effective administration of justice. The eminent American sociologist E.A. Ross, writing in 1913, characterized the regular behavior of Eastern European Jews in very similar terms.

Lindemann also allocates a short chapter to discussing the 1911 Beilis Affair, in which a Ukrainian Jew was accused of the ritual murder of a young Gentile boy, an incident that generated a great deal of international attention and controversy. Based on the evidence presented, the defendant seems likely to have been innocent, although the obvious lies he repeatedly told police interrogators hardly helped foster that impression, and "the system worked" in that he was ultimately found innocent by the jurors at his trial. However, a few pages are also given to a much less well-known ritual murder case in late 19th century Hungary, in which the evidence of Jewish guilt seemed far stronger, though the author hardly accepted the possible

reality of such an outlandish crime. Such reticence was quite understandable since the publication of Ariel Toaff's remarkable volume on the subject was still a dozen years in the future.



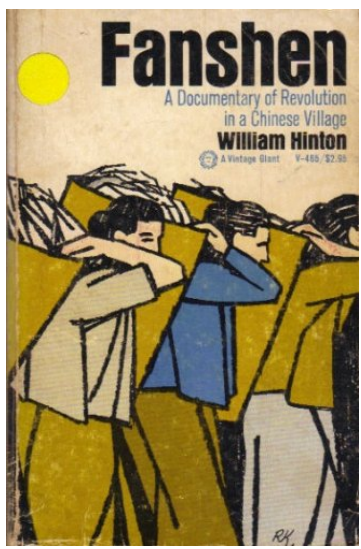
Lindemann subsequently expanded his examination of historical anti-Semitism into a much broader treatment, *Esau's Tears*, which appeared in 1997. In this volume, he added comparative studies of the social landscape in Germany, Britain, Italy, and several other European countries, and demonstrated that the relationship between Jews and non-Jews varied greatly across different locations and time periods. But although I found his analysis quite useful and interesting, the extraordinarily harsh attacks his text provoked from some outraged Jewish academics seemed even more intriguing.

For example, Judith Laikin Elkin opened her discussion in *The American Historical Review* by describing the book as a "545-page polemic" a strange characterization of a book so remarkably even-handed and factually-based in its scholarship. Writing in *Commentary*, Robert Wistrich was even harsher, stating that merely reading the book had been a painful experience for him, and his review seemed filled with spittle-flecked rage. Unless these individuals had somehow gotten copies of a different book, I found their attitudes simply astonishing.

I was not alone in such a reaction. Richard S. Levy of the University of Illinois, a noted scholar of anti-Semitism, expressed amazement at Wistrich's seemingly irrational outburst, while Paul Gottfried, writing

in *Chronicles*, mildly suggested that Lindemann had "touched raw nerves." Indeed, Gottfried's own evaluation quite reasonably criticized Lindemann for perhaps being a little too even-handed, sometimes presenting numerous conflicting analyzes without choosing between them. For those interested, a good discussion of the book by Alan Steinweis, a younger scholar specializing in the same topic, is conveniently available online.

The remarkable ferocity with which some Jewish writers attacked Lindemann's meticulous attempt to provide an accurate history of anti-Semitism may carry more significance than merely an exchange of angry words in low-circulation academic publications. If our mainstream media shapes our reality, scholarly books and articles based upon them tend to set the contours of that media coverage. And the ability of a relatively small number of agitated and energetic Jews to police the acceptable boundaries of historical narratives may have enormous consequences for our larger society, deterring scholars from objectively reporting historical facts and preventing students from discovering them.



The undeniable truth is that for many centuries Jews usually constituted a wealthy and privileged segment of the population in nearly all the European countries in which they resided, and quite frequently they based their livelihood upon the heavy exploitation of a downtrodden peasantry. Even without any differences in ethnicity, language, or religion, such conditions almost invariably provoke hostility. The victory of Mao's Communist forces in China was quickly followed by the brutal massacre of a million or more Han Chinese

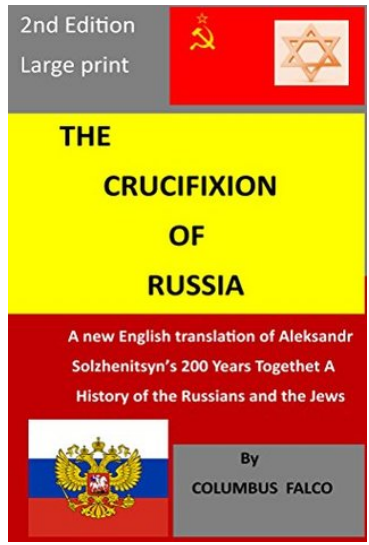
landlords by the Han Chinese poor peasants who regarded them as cruel oppressors, with William Hinton's classic *Fanshen* describing the unfortunate history that unfolded in one particular village. When similar circumstances led to violent clashes in Eastern Europe between Slavs and Jews, does it really make logical sense to employ a specialized term such as "anti-Semitism" to describe that situation?

Furthermore, some of the material presented in Lindemann's rather innocuous text might also lead to potentially threatening ideas. Consider, for example, the notorious *Protocols of the Learned Elders of Zion*, almost certainly fictional, but hugely popular and influential during the years following World War I and the Bolshevik Revolution. The fall of so many longstanding Gentile dynasties and their replacement by new regimes such as Soviet Russia and Weimar Germany, which were heavily dominated by their tiny Jewish minorities, quite naturally fed suspicions of a worldwide Jewish plot, as did the widely discussed role of Jewish international bankers in producing those political outcomes.

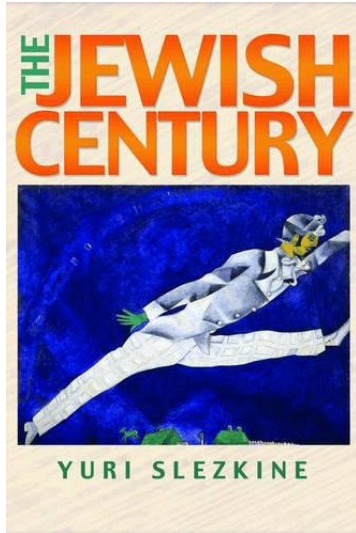
Over the decades, there has been much speculation about the possible inspiration for the *Protocols*, but although Lindemann makes absolutely no reference to that document, he does provide a very intriguing possible candidate. Jewish-born British Prime Minister Benjamin Disraeli certainly ranked as one of the most influential figures of the late 19th century, and in his novel *Coningsby*, he has the character representing Lord Lionel Rothschild boast about the existence of a vast and secret network of powerful international Jews, who stand near the head of almost every major nation, quietly controlling their governments from behind the scenes. If one of the world's most politically well-connected Jews eagerly promoted such notions, was Henry Ford really so unreasonable in doing the same?

Lindemann also notes Disraeli's focus on the extreme importance of race and racial origins, a central aspect of traditional Jewish religious doctrine. He reasonably suggests that this must surely have had a huge influence upon the rise of those political ideas, given that Disraeli's public profile and stature were so much greater than the mere writers or activists whom our history books usually place at center stage. In fact, Houston Stewart Chamberlain, a leading racial theorist, actually cited Disraeli as a key source for his ideas. Jewish intellectuals such as Max Nordau and Cesare Lombroso are already widely recognized as leading figures in the rise of the racial science of that era, but Disraeli's under-appreciated role may have actually been far greater. The deep Jewish roots of European racialist movements are hardly something that many present-day Jews would want widely

known.



One of the harsh Jewish critics of *Esau's Tears* denounced Cambridge University Press for even allowing the book to appear in print, and although that major work is easily available in English, there are numerous other cases where an important but discordant version of historical reality has been successfully blocked from publication. For decades most Americans would have ranked Nobel Laureate Alexander Solzhenitsyn as among the world's greatest literary figures, and his *Gulag Archipelago* alone sold over 10 million copies. But his last work was a massive two-volume account of the tragic 200 years of shared history between Russians and Jews, and despite its 2002 release in Russian and numerous other world languages, there has yet to be an authorized English translation, though various partial editions have circulated on the Internet in *samizdat* form.

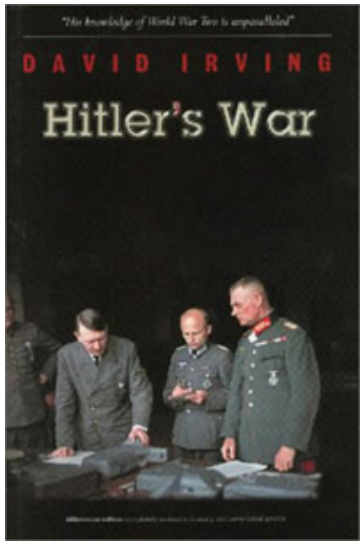


At one point, a full English version was briefly available for sale at Amazon.com and I purchased it. Glancing through a few sections, the work appeared quite even-handed and innocuous to me, but it seemed to provide a far more detailed and uncensored account than anything else previously available, which obviously was the problem. The Bolshevik Revolution resulted in the deaths of many tens of millions of people worldwide, and the overwhelming Jewish role in its leadership would become more difficult to erase from historical memory if Solzhenitsyn's work were easily available. Also, his candid discussion of the economic and political behavior of Russian Jewry in pre-revolutionary times directly conflicted with the hagiography widely promoted by Hollywood and the popular media. Historian Yuri Slezkine's award-winning 2004 book *The Jewish Century* provided many similar facts, but his treatment was far more cursory and his public stature not remotely the same.

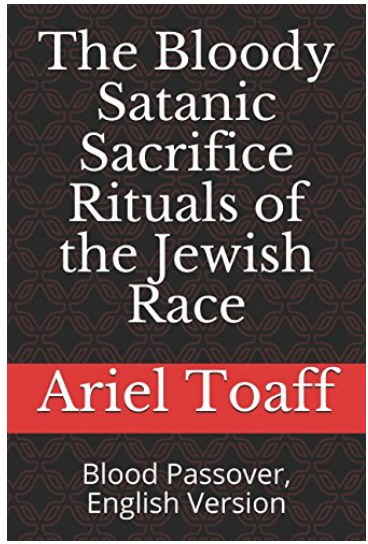
Near the end of his life, Solzhenitsyn gave his political blessing to Russian President Vladimir Putin, and Russia's leaders honored him upon his death, while his *Gulag* volumes are now enshrined as mandatory reading in the standard high school curriculum of today's overwhelmingly Christian Russia. But even as his star rose again in his own homeland, it seems to have sharply fallen in our own country, and his trajectory may eventually relegate him to nearly un-person status.

A couple of years after the release of Solzhenitsyn's controversial final book, an American writer named Anne Applebaum published a thick history bearing the same title *Gulag*, and her work received enormously favorable media coverage and won her a Pulitzer Prize; I

have even heard claims that her book has been steadily replacing that earlier *Gulag* on many college reading lists. But although Jews constituted a huge fraction of the top leadership of the Soviet Gulag system during its early decades, as well as that of the dreaded NKVD which supplied the inmates, nearly her entire focus on her own ethnic group during Soviet times is that of victims rather than victimizers. And by a remarkable irony of fate, she shares a last name with one of the top Bolshevik leaders, Hirsch Apfelbaum, who concealed his own ethnic identity by calling himself Grigory Zinoviev.



The striking decline in Solzhenitsyn's literary status in the West came just a decade or two after an even more precipitous collapse in the reputation of David Irving, and for much the same reason. Irving probably ranked as the most internationally successful British historian of the last one hundred years and a renowned scholar of World War II, but his extensive reliance on primary source documentary evidence posed an obvious threat to the official narrative promoted by Hollywood and wartime propaganda. When he published his magisterial *Hitler's War*, this conflict between myth and reality came into the open, and an enormous wave of attacks and vilification was unleashed, gradually leading to his purge from respectability and eventually even his imprisonment.



Similarly, Israeli academic Ariel Toaff, son of the chief rabbi of Rome, was regarded as one of the world's leading scholarly authorities on Medieval Jewry. But when he published his remarkable 2004 analysis suggesting the likely reality of the Jewish ritual murders of Christian children throughout history, the resulting media firestorm forced the cancellation of the book's publication, and the work only survives in *samizdat* form, while there were even calls for his arrest and incarceration.

In other cases, pressure from the ADL and similar Jewish activist groups have led Amazon to completely eliminate entire categories of historical analysis and ban those publishers who produce such works, which drastically reduces their availability to the reading public.

All of these cases were the sort of high-profile examples which are well-known to anyone who pays attention to such matters. But surely there must have been many other incidents, involving far less prominent authors, which never received any significant media coverage, and also a vastly larger universe of cases in which writers have self-censored their texts in order to avoid such controversies. Over the decades, I have gradually discovered through sad experience that I must exercise extreme caution whenever I read anything relating to the subjects of Jews, Judaism, or Israel.

These important examples may help to explain the puzzling contrast between the behavior of Jews in the aggregate and Jews as individuals. Observers have noticed that even fairly small Jewish

minorities may often have a major impact upon the far larger societies that host them. But on the other hand, in my experience at least, a large majority of individual Jews do not seem all that different in their personalities or behavior than their non-Jewish counterparts. So how does a community whose individual mean is not so unusual generate what seems to be such a striking difference in collective behavior? I think the answer may involve the existence of information choke-points, and the role of relatively small numbers of particularly zealous and agitated Jews in influencing and controlling these.

We live our lives constantly immersed in media narratives, and these allow us to decide the rights and wrongs of a situation. The vast majority of people, Jew and Gentile alike, are far more likely to take strong action if they are convinced that their cause is a just one. This is obviously the basis for war-time propaganda.

Now suppose that a relatively small number of zealous Jewish partisans are known to always attack and denounce journalists or authors who accurately describe Jewish misbehavior. Over time, this ongoing campaign of intimidation may cause many important facts to be left on the cutting-room floor, or even gradually expel from mainstream respectability those writers who refuse to conform to such pressures. Meanwhile, similar small numbers of Jewish partisans frequently exaggerate the misdeeds committed against Jews, sometimes piling their exaggerations upon past exaggerations already produced by a previous round of such zealots.

Eventually, these two combined trends may take a complex and possibly very mixed historical record and transform it into a simple morality-play, with innocent Jews tremendously injured by vicious Jew-haters. And as this morality-play becomes established it deepens the subsequent intensity of other Jewish-activists, who redouble their demands that the media “stop vilifying Jews” and covering up the supposed evils inflicted upon them. An unfortunate circle of distortion following exaggeration following distortion can eventually produce a widely accepted historical account that bears little resemblance to the reality of what actually happened.

So as a result, the vast majority of quite ordinary Jews, who would normally behave in quite ordinary ways, are misled by this largely fictional history, and rather understandably become greatly outraged at all the horrible things that had been done to their suffering people, some of which are true and some of which are not, while remaining completely ignorant of the other side of the ledger.

Furthermore, this situation is exacerbated by the common tendency of Jews to "cluster" together, perhaps respresenting just one or two percent of the total population, but often constituting 20% or 40% or 60% of their immediate peer-group, especially in certain professions. Under such conditions, the ideas or emotional agitation of some Jews probably permeates others around them, often provoking additional waves of indignation.

As a rough analogy, a small quantity of uranium is relatively inert and harmless, and entirely so if distributed within low-density ore. But if a significant quantity of weapons-grade uranium is sufficiently compressed, then the neutrons released by fissioning atoms will quickly cause additional atoms to undergo fission, with the ultimate result of that critical chain-reaction being a nuclear explosion. In similar fashion, even a highly agitated Jew may have no negative impact, but if the collection of such agitated Jews becomes too numerous and clusters together too closely, they may work each other into a terrible frenzy, perhaps with disastrous consequences both for themselves and for their larger society. This is especially true if those agitated Jews begin to dominate certain key nodes of top-level control, such as the central political or media organs of a society.

Whereas most living organizations exist solely in physical reality, human beings also occupy an ideational space, with the interaction of human consciousness and perceived reality playing a major role in shaping behavior. Just as the pheromones released by mammals or insects can drastically affect the reactions of their family members or nest-mates, the ideas secreted by individuals or the media-emitters of a society can have an enormous impact upon their fellows.

A cohesive, organized group generally possesses huge advantages over a teeming mass of atomized individuals, much like a disciplined Macedonian Phalanx could easily defeat a vastly larger body of disorganized infantry. Many years ago, on some website somewhere I came across a very insightful comment regarding the obvious connection between "anti-Semitism" and "racism," which our mainstream media organs identify as two of the world's greatest evils. Under this analysis, "anti-Semitism" represents the tendency to criticize or resist Jewish social cohesion, while "racism" represents the attempt of white Gentiles to maintain a similar social cohesion of their own. To the extent that the ideological emanations from our centralized media organs serve to strengthen and protect Jewish cohesion while attacking and dissolving any similar cohesion on the part of their Gentile counterparts, the former will obviously gain enormous advantages in resource-competition against the latter.

Religion obviously constitutes an important unifying factor in human social groups and we cannot ignore the role of Judaism in this regard. Traditional Jewish religious doctrine seems to consider Jews as being in a state of permanent hostility with all non-Jews, and the use of dishonest propaganda is an almost inevitable aspect of such conflict. Furthermore, since Jews have invariably been a small political minority, maintaining such controversial tenets required the employment of a massive framework of subterfuge and dissimulation in order to conceal their nature from the larger society surrounding them. It has often been said that truth is the first casualty in war, and surely the cultural influences of over a thousand years of such intense religious hostility may continue to quietly influence the thinking of many modern Jews, even those who have largely abandoned their religious beliefs.

The notorious Jewish tendency to shamelessly lie or wildly exaggerate has sometimes had horrifying human consequences. I very recently discovered a fascinating passage in Peter Moreira's 2014 book *The Jew Who Defeated Hitler: Henry Morgenthau Jr., FDR, and How We Won the War*, focused on the important political role of that powerful Secretary of the Treasury.

> A turning point in Henry Morgenthau Jr.'s relationship with the Jewish community came in November 1942, when Rabbi Stephen Wise came to the corner office to tell the secretary what was happening in Europe. Morgenthau knew of the millions of deaths and the lampshades made from victims' skin, and he asked Wise not to go into excessive details. But Wise went on to tell of the barbarity of the Nazis, how they were making soap out of Jewish flesh. Morgenthau, turning paler, implored him, "Please, Stephen, don't give me the gory details." Wise went on with his list of horrors and Morgenthau repeated his plea over and over again. Henrietta Klotz was afraid her boss would keel over. Morgenthau later said the meeting changed his life.

It is easy to imagine that Morgenthau's gullible acceptance of such obviously ridiculous war-time atrocity stories played a major role when he later lent his name and support to remarkably brutal American occupation policies that probably led to the postwar deaths of many millions of innocent German civilians.

# Jews and Nazis

August 6, 2018 • 6,800 Words

Around 35 years ago, I was sitting in my college dorm-room closely reading the *New York Times* as I did each and every morning when I noticed an astonishing article about the controversial new Israeli Prime Minister, Yitzhak Shamir.

Back in those long-gone days, the Gray Lady was strictly a black-and-white print publication, lacking the large color photographs of rap stars and long stories about dieting techniques that fill so much of today's news coverage, and it also seemed to have a far harder edge in its Middle East reporting. A year or so earlier, Shamir's predecessor Menacham Begin had allowed his Defense Minister Ariel Sharon to talk him into invading Lebanon and besieging Beirut, and the subsequent massacre of Palestinian women and children in the Sabra and Shatila refugee camps had outraged the world and angered America's government. This eventually led to Begin's resignation, with Shamir, his Foreign Minister, taking his place.

Prior to his surprising 1977 election victory, Begin had spent decades in the political wilderness as an unacceptable right-winger, and Shamir had an even more extreme background, with the American mainstream media freely reporting his long involvement in all sorts of high-profile assassinations and terrorist attacks during the 1940s, painting him as a very bad man indeed.

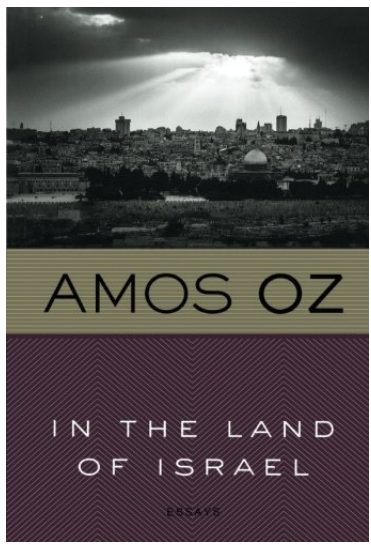
Given Shamir's notorious activities, few revelations would have shocked me, but this one did. Apparently, during the late 1930s, Shamir and his small Zionist faction had become great admirers of the Italian Fascists and German Nazis, and after World War II broke out, they had made repeated attempts to contact Mussolini and the German leadership in 1940 and 1941, hoping to enlist in the Axis Powers as their Palestine affiliate, and undertake a campaign of attacks and espionage against the local British forces, then share in the political booty after Hitler's inevitable triumph.

Now the *Times* clearly viewed Shamir in a very negative light, but it seemed extremely unlikely to me that they would have published such a remarkable story without being absolutely sure of their facts. Among other things, there were long excerpts from the official letters sent to Mussolini ferociously denouncing the "decadent" democratic systems

of Britain and France that he was opposing, and assuring *Il Duce* that such ridiculous political notions would have no future place in the totalitarian Jewish client state they hoped to establish under his auspices in Palestine.

As it happens, both Germany and Italy were preoccupied with larger geopolitical issues at the time, and given the small size of Shamir's Zionist faction, not much seems to have ever come of those efforts. But the idea of the sitting Prime Minister of the Jewish State having spent his early wartime years as an unrequited Nazi ally was certainly something that sticks in one's mind, not quite conforming to the traditional narrative of that era which I had always accepted.

Most remarkably, the revelation of Shamir's pro-Axis past seems to have had only a relatively minor impact upon his political standing within Israeli society. I would think that any American political figure found to have supported a military alliance with Nazi Germany during the Second World War would have had a very difficult time surviving the resulting political scandal, and the same would surely be true for politicians in Britain, France, or most other western nations. But although there was certainly some embarrassment in the Israeli press, especially after the shocking story reached the international headlines, apparently most Israelis took the whole matter in stride, and Shamir stayed in office for another year, then later served a second, much longer term as Prime Minister during 1986-1992. The Jews of Israel apparently regarded Nazi Germany quite differently than did most Americans, let alone most American Jews.



Around that same time, a second intriguing example of this quite different Israeli perspective towards the Nazis also came to my attention. In 1983, Amoz Oz, often described as Israel's greatest novelist, had published *In the Land of Israel* to glowing reviews. This book was a collection of lengthy interviews with various representative figures in Israeli society, both moderate and extreme, as well as some coverage of the Palestinians who also lived among them.

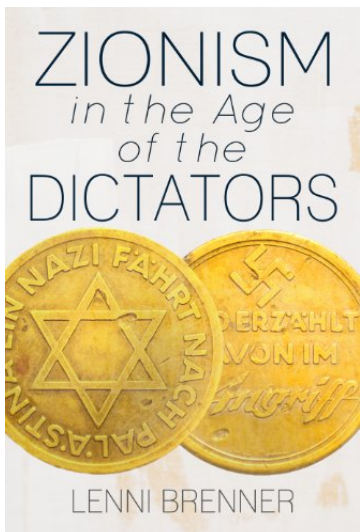
Of these ideological profiles, one of the shortest but most widely discussed was that of an especially hard-line political figure, unnamed but almost universally believed to be Ariel Sharon, a conclusion certainly supported by the personal details and physical description provided. Near the very beginning, that figure mentioned that people of his ideological ilk had recently been denounced as "Judeo-Nazis" by a prominent liberal Israeli academic, but rather than reject that label, he fully welcomed it. So the subject generally became known in public discussions as the "Judeo-Nazi."

That he described himself in such terms was hardly an exaggeration, since he rather gleefully advocated the slaughter of millions of Israel's enemies, and the vast expansion of Israeli territory by conquest of neighboring lands and expulsion of their populations, along with the free use of nuclear weapons if they or anyone else too strongly resisted such efforts. In his bold opinion, the Israelis and Jews in general were just too soft and meek, and needed to regain their place in the world by once again becoming a conquering people, probably hated but definitely feared. To him, the large recent massacre of Palestinian women and children at Sabra and Shatila was of no consequence whatsoever, and the most unfortunate aspect of the incident was that the killers had been Israel's Christian Phalangist allies rather than Israeli soldiers themselves.

Now rhetorical excess is quite common among politicians and a shroud of pledged anonymity will obviously loosen many tongues. But can anyone imagine an American or other Western public figure talking in such terms, let alone someone who moves in higher political circles? These days, Donald Trump sometimes Tweets out a crude misspelled insult at 2am, and the American media is aghast in horror. But given that his administration leaks like a sieve, if he routinely boasted to his confidants about possibly slaughtering millions, we surely would have heard about it. For that matter, there seems not the slightest evidence that the original German Nazis ever spoke in such ways privately, let alone while a journalist was carefully taking notes. But the "Judeo-Nazis" of Israel are another story.

As near as I can recall, the last even slightly prominent figure in American public life who declared himself a "Nazi" was George Lincoln Rockwell during the 1960s, and he was much more of a political performance artist than an actual political leader. Even as marginalized a figure as David Duke has always hotly denied such an accusation. But apparently politics in Israel is played by different rules.

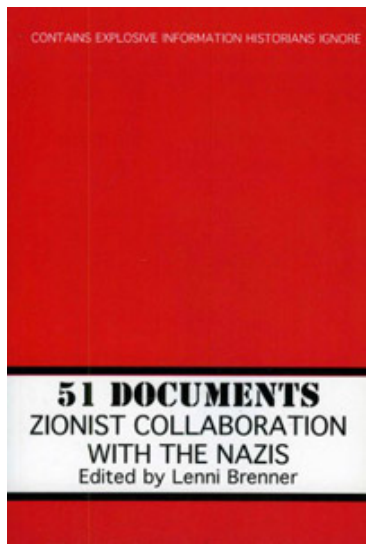
In any event, Sharon's purported utterances seem to have had little negative impact upon his subsequent political career, and after spending some time in the political wilderness after the Lebanon disaster, he eventually served five years as Prime Minister during 2001-2006, although by that later date his views were regularly denounced as too soft and compromising due to the steady rightward drift of the Israeli political spectrum.



Over the years I've occasionally made half-hearted attempts to locate the *Times* article about Shamir that had long stuck in my memory, but have had no success, either because it was removed from the *Times* archives or more likely because my mediocre search skills proved inadequate. But I'm almost certain that the piece had been prompted by the 1983 publication of *Zionism in the Age of the Dictators* by Lenni Brenner, an anti-Zionist of the Trotskyite persuasion and Jewish origins. I only very recently discovered that book, which really tells an extremely interesting story.

Brenner, born in 1937, has spent his entire life as an unreconstructed

hard-core leftist, with his enthusiasms ranging from Marxist revolution to the Black Panthers, and he is obviously a captive of his views and his ideology. At times, this background impairs the flow of his text, and the periodic allusions to “proletarian,” “bourgeoisie,” and “capitalist classes” sometimes grow a little wearisome, as does his unthinking acceptance of all the shared beliefs common to his political circle. But surely only someone with that sort of fervent ideological commitment would have been willing to devote so much time and effort to investigating that controversial subject and ignoring the endless denunciations that resulted, which even included physical assaults by Zionist partisans.



In any event, his documentation seems completely airtight, and some years after the original appearance of his book, he published a companion volume entitled *51 Documents: Zionist Collaboration with the Nazis*, which simply provides English translations of all the raw evidence behind his analytical framework, allowing interested parties to read the material and draw their own conclusions.

Among other things, Brenner provides considerable evidence that the larger and somewhat more mainstream right-wing Zionist faction later led by future Israeli Prime Minister Menachem Begin was almost invariably regarded as a Fascist movement during the 1930s, even apart from its warm admiration for Mussolini’s Italian regime. This was hardly such a dark secret in that period given that its main Palestine newspaper carried a regular column by a top ideological leader entitled “Diary of a Fascist.” During one of the major international Zionist conferences, factional leader Vladimir Jabotinsky

entered the hall with his brown-shirted followers in full military formation, leading the chair to ban the wearing of uniforms in order to avoid a riot, and his faction was soon defeated politically and eventually expelled from the Zionist umbrella organization. This major setback was largely due to the widespread hostility the group had aroused after two of its members were arrested by British police for the recent assassination of Chaim Arlosoroff, one of the highest-ranking Zionist officials based in Palestine.

Indeed, the inclination of the more right-wing Zionist factions toward assassination, terrorism, and other forms of essentially criminal behavior was really quite remarkable. For example, in 1943 Shamir had arranged the assassination of his factional rival, a year after the two men had escaped together from imprisonment for a bank robbery in which bystanders had been killed, and he claimed he had acted to avert the planned assassination of David Ben-Gurion, the top Zionist leader and Israel's future founding-premier. Shamir and his faction certainly continued this sort of behavior into the 1940s, successfully assassinating Lord Moyne, the British Minister for the Middle East, and Count Folke Bernadotte, the UN Peace Negotiator, though they failed in their other attempts to kill American President Harry Truman and British Foreign Minister Ernest Bevin, and their plans to assassinate Winston Churchill apparently never moved past the discussion stage. His group also pioneered the use of terrorist car-bombs and other explosive attacks against innocent civilian targets, all long before any Arabs or Muslims had ever thought of using similar tactics; and Begin's larger and more "moderate" Zionist faction did much the same. Given that background, it was hardly surprising that Shamir later served as director of assassinations at the Israeli Mossad during 1955-1965, so if the Mossad did indeed play a major role in the assassination of President John F. Kennedy, he was very likely involved.

The cover of the 2014 paperback edition of Brenner's book displays the commemorative medal struck by Nazi Germany to mark its Zionist alliance, with a Star-of-David on the front face and a Swastika on the obverse. But oddly enough, this symbolic medallion actually had absolutely no connection with the unsuccessful attempts by Shamir's small faction to arrange a Nazi military alliance during World War II.

Although the Germans paid little attention to the entreaties of that minor organization, the far larger and more influential mainstream Zionist movement of Chaim Weizmann and David Ben-Gurion was something else entirely. And during most of the 1930s, these other Zionists had formed an important economic partnership with Nazi Germany, based upon an obvious commonality of interests. After all, Hitler regarded Germany's one percent Jewish population as a disruptive and potentially dangerous element which he wanted gone, and the Middle East seemed as good a destination for them as any other. Meanwhile, the Zionists had very similar objectives, and the creation of their new national homeland in Palestine obviously required both Jewish immigrants and Jewish financial investment.

LATE NEWS

After Hitler had been named Chancellor in 1933, outraged Jews worldwide had quickly launched an economic boycott, hoping to bring Germany to its knees, with London's *Daily Express* famously running the banner headline "Judea Declares War on Germany." Jewish political and economic influence, then just like now, was very considerable, and in the depths of the Great Depression, impoverished Germany needed to export or die, so a large scale boycott in major German markets posed a potentially serious threat. But this exact situation provided Zionist groups with an excellent opportunity to offer the Germans a means of breaking that trade embargo, and they demanded favorable terms for the export of high-quality German manufactured goods to Palestine, together with accompanying German Jews. Once word of this major *Ha'avara* or "Transfer Agreement" with the Nazis came out at a 1933 Zionist Convention, many Jews and Zionists were outraged, and it led to various splits and controversies. But the economic deal was too good to resist, and it went forward and quickly grew.

The importance of the Nazi-Zionist pact for Israel's establishment is difficult to overstate. According to a 1974 analysis in *Jewish Frontier* cited by Brenner, between 1933 and 1939 over 60% of all the investment in Jewish Palestine came from Nazi Germany. The worldwide impoverishment of the Great Depression had drastically reduced ongoing Jewish financial support from all other sources, and Brenner reasonably suggests that without Hitler's financial backing, the nascent Jewish colony, so tiny and fragile, might easily have shriveled up and died during that difficult period.

Such a conclusion leads to fascinating hypotheticals. When I first stumbled across references to the *Ha'avara* Agreement on websites here and there, one of the commenters mentioning the issue half-jokingly suggested that if Hitler had won the war, statues would surely have been built to him throughout Israel and he would today be

recognized by Jews everywhere as the heroic Gentile leader who had played the central role in reestablishing a national homeland for the Jewish people in Palestine after almost 2000 years of bitter exile.

This sort of astonishing counter-factual possibility is not nearly as totally absurd as it might sound to our present-day ears. We must recognize that our historical understanding of reality is shaped by the media, and media organs are controlled by the winners of major wars and their allies, with inconvenient details often excluded to avoid confusing the public. It is undeniably true that in his 1924 book *Mein Kampf*, Hitler had written all sorts of hostile and nasty things about Jews, especially those who were recent immigrants from Eastern Europe, but when I read the book back in high school, I was a little surprised to discover that these anti-Jewish sentiments hardly seemed central to his text. Furthermore, just a couple of years earlier, a vastly more prominent public figure such as British Minister Winston Churchill had published sentiments nearly as hostile and nasty, focusing on the monstrous crimes being committed by Bolshevik Jews. In Albert Lindemann's *Esau's Tears*, I was surprised to discover that the author of the famous Balfour Declaration, the foundation of the Zionist project, was apparently also quite hostile to Jews, with an element of his motivation probably being his desire to exclude them from Britain.

Once Hitler consolidated power in Germany, he quickly outlawed all other political organizations for the German people, with only the Nazi Party and Nazi political symbols being legally permitted. But a special exception was made for German Jews, and Germany's local Zionist Party was accorded complete legal status, with Zionist marches, Zionist uniforms, and Zionist flags all fully permitted. Under Hitler, there was strict censorship of all German publications, but the weekly Zionist newspaper was freely sold at all newsstands and street corners. The clear notion seemed to be that a German National Socialist Party was the proper political home for the country's 99% German majority, while Zionist National Socialism would fill the same role for the tiny Jewish minority.

In 1934, Zionist leaders invited an important SS official to spend six months visiting the Jewish settlement in Palestine, and upon his return, his very favorable impressions of the growing Zionist enterprise were published as a massive 12-part series in Joseph Goebbel's *Der Angriff*, the flagship media organ of the Nazi Party, bearing the descriptive title "A Nazi Goes to Palestine." In his very angry 1920 critique of Jewish Bolshevik activity, Churchill had argued that Zionism was locked in a fierce battle with Bolshevism for the soul

of European Jewry, and only its victory might ensure amicable future relations between Jew and Gentile. Based on available evidence, Hitler and many of the other Nazi leaders seemed to have reached a somewhat similar conclusion by the mid-1930s.

During that era extremely harsh sentiments regarding Diaspora Jewry were sometimes found in rather surprising quarters. After the controversy surrounding Shamir's Nazi ties erupted into the headlines, Brenner's material became the grist for an important article by Edward Mortimer, the longtime Middle East expert at the august *Times of London*, and the 2014 edition of the book includes some choice extracts from Mortimer's February 11, 1984 *Times* piece:

> Who told a Berlin audience in March 1912 that "each country can absorb only a limited number of Jews, if she doesn't want disorders in her stomach. Germany already has too many Jews"?
>
> No, not Adolf Hitler but Chaim Weizmann, later president of the World Zionist Organization and later still the first president of the state of Israel.
>
> And where might you find the following assertion, originally composed in 1917 but republished as late as 1936: "The Jew is a caricature of a normal, natural human being, both physically and spiritually. As an individual in society he revolts and throws off the harness of social obligation, knows no order nor discipline"?
>
> Not in *Der Sturmer* but in the organ of the Zionist youth organization, Hashomer Hatzair.
>
> As the above quoted statement reveals, Zionism itself encouraged and exploited self-hatred in the Diaspora. It started from the assumption that anti-Semitism was inevitable and even in a sense justified so long as Jews were outside the land of Israel.
>
> It is true that only an extreme lunatic fringe of Zionism went so far as to offer to join the war on Germany's side in 1941, in the hope of establishing "the historical Jewish state on a national and totalitarian basis, and bound by a treaty with the German Reich." Unfortunately this was the group which the present Prime Minister of Israel chose to join.

The very uncomfortable truth is that the harsh characterizations of Diaspora Jewry found in the pages of *Mein Kampf* were not all that different from what was voiced by Zionism's founding fathers and its subsequent leaders, so the cooperation of those two ideological

movements was not really so totally surprising.

However, uncomfortable truths do remain uncomfortable. Mortimer had spent nineteen years at the *Times*, the last dozen of them as the foreign specialist and leader-writer on Middle Eastern affairs. But the year after he wrote that article including those controversial quotations, his career at that newspaper ended, leading to an unusual gap in his employment history, and that development may or may not be purely coincidental.

Also quite ironic was the role of Adolf Eichmann, whose name today probably ranks as one of the most famous half-dozen Nazis in history, due to his postwar 1960 kidnapping by Israeli agents, followed by his public show-trial and execution as a war-criminal. As it happens, Eichmann had been a central Nazi figure in the Zionist alliance, even studying Hebrew and apparently becoming something of a philo-Semite during the years of his close collaboration with top Zionist leaders.

Brenner is a captive of his ideology and his beliefs, accepting without question the historical narrative with which he was raised. He seems to find nothing so strange about Eichmann being a philo-Semitic partner of the Jewish Zionists during the late 1930s and then suddenly being transformed into a mass-murderer of the European Jews in the early 1940s, willingly committing the monstrous crimes for which the Israelis later justly put him to death.

This is certainly possible, but I really wonder. A more cynical observer might find it a very odd coincidence that the first prominent Nazi the Israelis made such an effort to track down and kill had been their closest former political ally and collaborator. After Germany's defeat, Eichmann had fled to Argentina and lived there quietly for a number of years until his name resurfaced in a celebrated mid-1950s controversy surrounding one of his leading Zionist partners, then living in Israel as a respected government official, who was denounced as a Nazi collaborator, eventually ruled innocent after a celebrated trial, but later assassinated by former members of Shamir's faction.

Following that controversy in Israel, Eichmann supposedly gave a long personal interview to a Dutch Nazi journalist, and although it wasn't published at the time, perhaps word of its existence may have gotten into circulation. The new state of Israel was just a few years old at that time, and very politically and economically fragile, desperately dependent upon the goodwill and support of America and Jewish donors worldwide. Their remarkable former Nazi alliance was a

deeply-suppressed secret, whose public release might have had absolutely disastrous consequences.

According to the version of the interview later published as a two-part story in *Life Magazine*, Eichmann's statements seemingly did not touch upon the deadly topic of the 1930s Nazi-Zionist partnership. But surely Israeli leaders must have been terrified that they might not be so lucky the next time, so we may speculate that Eichmann's elimination suddenly became a top national priority, and he was tracked down and captured in 1960. Presumably, harsh means were employed to persuade him not to reveal any of these dangerous pre-war secrets at his Jerusalem trial, and one might wonder if the reason he was famously kept in an enclosed glass booth was to ensure that the sound could quickly be cut off if he started to stray from the agreed upon script. All of this analysis is purely speculative, but Eichmann's role as a central figure in the 1930s Nazi-Zionist partnership is undeniable historical fact.

Just as we might imagine, America's overwhelmingly pro-Israel publishing industry was hardly eager to serve as a public conduit for Brenner's shocking revelations of a close Nazi-Zionist economic partnership, and he mentions that his book agent uniformly received rejections from each firm he approached, based on a wide variety of different excuses. However, he finally managed to locate an extremely obscure publisher in Britain willing to take on the project, and his book was released in 1983, initially receiving no reviews other than a couple of harsh and perfunctory denunciations, though Soviet *Izvestia* took some interest in his findings until they discovered that he was a hated Trotskyite.

His big break came when Shamir suddenly became Israel's Prime Minister, and he brought his evidence of former Nazi ties to the English-language Palestinian press, which put it into general circulation. Various British Marxists, including the notorious "Red Ken" Livingstone of London, organized a speaking tour for him, and when a group of right-wing Zionist militants attacked one of the events and inflicted injuries, the story of the brawl caught the attention of the mainstream newspapers. Soon afterward the discussion of Brenner's astonishing discoveries appeared in the *Times of London* and entered the international media. Presumably, the *New York Times* article that had originally caught my eye ran sometime during this period.

Public relations professionals are quite skilled at minimizing the impact of damaging revelations, and pro-Israel organizations have no shortage of such individuals. Just before the 1983 release of his remarkable book, Brenner suddenly discovered that a young pro-Zionist author named Edwin Black was furiously working on a similar project, apparently backed by sufficient financial resources that he was employing an army of fifty researchers to allow him to complete his project in record time.

Since the entire embarrassing subject of a Nazi-Zionist partnership had been kept away from the public eye for almost five decades, this timing surely seems more than merely coincidental. Presumably word of Brenner's numerous unsuccessful efforts at securing a mainstream publisher during 1982 had gotten around, as had as his eventual success in locating a tiny one in Britain. Having failed to prevent publication of such explosive material, pro-Israel groups quietly decided that their next best option was trying to seize control of the topic themselves, allowing disclosure of those parts of the story that could not be concealed but excluding items of greatest danger, while portraying the sordid history in the best possible light.

The Transfer Agreement
The Dramatic Story of the Pact Between the Third Reich and Jewish Palestine
25th Anniversary Edition
Jude
EDWIN BLACK
The New York Times best-selling author of IBM and the Holocaust and War Against the Weak
Afterword by Abraham H. Foxman
Copyrighted Material

Black's book, *The Transfer Agreement*, may have arrived a year later than Brenner's but was clearly backed by vastly greater publicity and resources. It was released by Macmillan, a leading publisher, ran nearly twice the length of Brenner's short book, and carried powerful endorsements by leading figures from the firmament of Jewish activism, including the Simon Weisenthal Center, the Israel Holocaust Memorial, and the American Jewish Archives. As a consequence, it

received long if not necessarily favorable reviews in influential publications such as *The New Republic* and *Commentary*.

In all fairness, I should mention that in the Foreword to his book, Black claims that his research efforts had been totally discouraged by nearly everyone he approached, and as a consequence, he had been working on the project with solitary intensity for many years. This implies the near-simultaneous release of the two books was purely due to chance. But such a picture is hardly consistent with his glowing testimonials from so many prominent Jewish leaders, and personally I find Brenner's claim that Black was assisted by fifty researchers far more convincing.

Since both Black and Brenner were describing the same basic reality and relying upon many of the same documents, in most respects the stories they tell are generally similar. But Black carefully excludes any mention of offers of Zionist military cooperation with the Nazis, let alone the repeated attempts by Shamir's Zionist faction to officially join the Axis Powers after the war had broken out, as well as numerous other details of a particularly embarrassing nature.

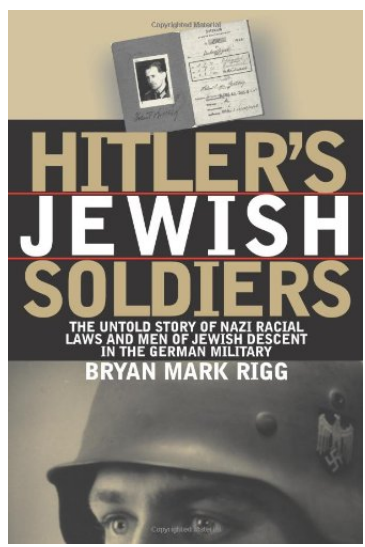
Assuming Black's book was published for the reasons I suggested, I think that the strategy of the pro-Israel groups largely succeeded, with his version of the history seeming to have quickly supplanted Brenner's except perhaps in strongly leftist or anti-Zionist circles. Googling each combination of the title and author, Black's book gets eight times as many hits, and his Amazon sales ranks and numbers of reviews are also larger by roughly that same factor. Most notably, neither the Wikipedia articles on "The Transfer Agreement" and "The *Ha'avara* Agreement" contain any mention of Brenner's research whatsoever, even though his book was published earlier, was far broader, and only he provided the underlying documentary evidence. As a personal example of the current situation, I was quite unaware of the entire *Ha'avara* history until just a few years ago when I encountered some website comments mentioning Black's book, leading me to purchase and read it. But even then, Brenner's far more wide-ranging and explosive volume remained totally unknown to me until very recently.

Once World War II began, this Nazi-Zionist partnership quickly lapsed for obvious reasons. Germany was now at war with the British Empire, and financial transfers to British-run Palestine were no longer possible. Furthermore, the Arab Palestinians had grown quite hostile

to the Jewish immigrants whom they rightfully feared might eventually displace them, and once the Germans were forced to choose between maintaining their relationship with a relatively small Zionist movement or winning the political sympathy of a vast sea of Middle Eastern Arabs and Muslims, their decision was a natural one. The Zionists faced a similar choice, and especially once wartime propaganda began so heavily blackening the German and Italian governments, their long previous partnership was not something they wanted widely known.

However, at exactly this same moment a somewhat different and equally long-forgotten connection between Jews and Nazi Germany suddenly moved to the fore.

Like most people everywhere, the average German, whether Jewish or Gentile, was probably not all that political, and although Zionism had for years been accorded a privileged place in German society, it is not entirely clear how many ordinary German Jews paid much attention to it. The tens of thousands who emigrated to Palestine during that period were probably motivated as much by economic pressures as by ideological commitment. But wartime changed matters in other ways.



HITLER'S
JEWISH
SOLDIERS
THE UNTOLD STORY OF NAZI RACIAL LAWS AND MEN OF JEWISH DESCENT IN THE GERMAN MILITARY
BRYAN MARK RIGG

This was even more true for the German government. The outbreak of a world war against a powerful coalition of the British and French empires, later augmented by both Soviet Russia and the United States, imposed the sorts of enormous pressures that could often overcome ideological scruples. A few years ago, I discovered a fascinating 2002 book by Bryan Mark Rigg, *Hitler's Jewish Soldiers*, a scholarly treatment of exactly what the title implies. The quality of this

controversial historical analysis is indicated by the glowing jacket-blurbs from numerous academic experts and an extremely favorable treatment by an eminent scholar in *The American Historical Review*.

Obviously, Nazi ideology was overwhelmingly centered upon race and considered racial purity a crucial factor in national cohesion. Individuals possessing substantial non-German ancestry were regarded with considerable suspicion, and this concern was greatly amplified if that admixture was Jewish. But in a military struggle against an opposing coalition possessing many times Germany's population and industrial resources, such ideological factors might be overcome by practical considerations, and Rigg persuasively argues that some 150,000 half-Jews or quarter-Jews served in the armed forces of the Third Reich, a percentage probably not much different than their share of the general military-age population.

Germany's long-integrated and assimilated Jewish population had always been disproportionately urban, affluent, and well-educated. As a consequence it is not entirely surprising that a large proportion of these part-Jewish soldiers who served Hitler were actually combat officers rather than merely rank-and-file conscripts, and they included at least 15 half-Jewish generals and admirals, and another dozen quarter-Jews holding those same high ranks. The most notable example was Field Marshal Erhard Milch, Hermann Goering's powerful second-in-command, who played such an important operational role in creating the Luftwaffe. Milch certainly had a Jewish father, and according to some much less substantiated claims, perhaps even a Jewish mother as well, while his sister was married to an SS general.

Admittedly, the racially-elite SS itself generally had far stricter ancestry standards, with even a trace of non-Aryan parentage normally seen as disqualifying an individual from membership. But even here, the situation was sometimes complicated, since there were widespread rumors that Reinhard Heydrich, the second-ranking figure in that very powerful organization, actually had considerable Jewish ancestry. Rigg investigates that claim without coming to any clear conclusions, though he does seem to think that the circumstantial evidence involved may have been used by other high-ranking Nazi figures as a point of leverage or blackmail against Heydrich, who stood as one of the most important figures in the Third Reich.

As a further irony, most of these individuals traced their Jewish ancestry through their father rather than their mother, so although they were not Jewish according to rabbinical law, their family names

often reflected their partly Semitic origins, though in many cases Nazi authorities attempted to studiously overlook this glaringly obvious situation. As an extreme example noted by an academic reviewer of the book, a half-Jew bearing the distinctly non-Aryan name of Werner Goldberg actually had his photograph prominently featured in a 1939 Nazi propaganda newspaper, with the caption describing him as the "The Ideal German Soldier."

The author conducted more than 400 personal interviews of the surviving part-Jews and their relatives, and these painted a very mixed picture of the difficulties they had encountered under the Nazi regime, which varied enormously depending upon particular circumstances and the personalities of those in authority over them. One important source of complaint was that because of their status, part-Jews were often denied the military honors or promotions they had rightfully earned. However, under especially favorable conditions, they might also be legally reclassified as being of "German Blood," which officially eliminated any taint on their status.

Even official policy seems to have been quite contradictory and vacillating. For example, when the civilian humiliations sometimes inflicted upon the fully Jewish parents of serving half-Jews were brought to Hitler's attention, he regarded that situation as intolerable, declaring that either such parents must be fully protected against those indignities or all the half-Jews must be discharged, and eventually in April 1940 he issued a decree requiring the latter. However, this order was largely ignored by many commanders, or implemented through a honor-system that almost amounted to "Don't Ask, Don't Tell," so a considerable fraction of half-Jews remained in the military if they so wished. And then in July 1941, Hitler somewhat reversed himself, issuing a new decree that allowed "worthy" half-Jews who had been discharged to return to the military as officers, while also announcing that after the war, all quarter-Jews would be reclassified as fully "German Blood" Aryan citizens.

It has been said that after questions were raised about the Jewish ancestry of some of his subordinates, Goering once angrily responded "I will decide who is a Jew!" and that attitude seems to reasonably capture some of the complexity and subjective nature of the social situation.

Interestingly enough, many of part-Jews interviewed by Rigg recalled that prior to Hitler's rise to power, the intermarriage of their parents had often provoked much greater hostility from the Jewish rather than the Gentile side of their families, suggesting that even in heavily-

assimilated Germany, the traditional Jewish tendency toward ethnic exclusivity had still remained a powerful factor in that community.

Although the part-Jews in German military service were certainly subject to various forms of mistreatment and discrimination, perhaps we should compare this against the analogous situation in our own military in those same years with regard to America's Japanese or black minorities. During that era, racial intermarriage was legally prohibited across a large portion of the US, so the mixed-race population of those groups was either almost non-existent or very different in origin. And when Japanese-Americans were allowed to leave their wartime concentration camps and enlist in the military, they were entirely restricted to segregated all-Japanese units, but with the officers generally being white. Meanwhile, blacks were almost entirely barred from combat service, though they sometimes served in strictly-segregated support roles. The notion that an American with any appreciable trace of African, Japanese, or for that matter Chinese ancestry might serve as a general or even an officer in the U.S. military and thereby exercise command authority over white American troops would have been almost unthinkable. The contrast with the practice in Hitler's own military is quite different than what Americans might naively assume.

This paradox is not nearly as surprising as one might assume. The non-economic divisions in European societies had almost always been along lines of religion, language, and culture rather than racial ancestry, and the social tradition of more than a millennium could not easily be swept away by merely a half-dozen years of National Socialist ideology. During all those earlier centuries, a sincerely-baptized Jew, whether in Germany or elsewhere, was usually considered just as good a Christian as any other. For example, Tomas de Torquemada, the most fearsome figure of the dreaded Spanish Inquisition, actually came from a family of Jewish converts.

Even wider racial differences were hardly considered of crucial importance. Some of the greatest heroes of particular national cultures, such as Russia's Alexander Pushkin and France's Alexandre Dumas, had been individuals with significant black African ancestry, and this was certainly not considered any sort of disqualifying characteristic.

By contrast, American society from its inception had always been sharply divided by race, with other differences generally constituting

far smaller impediments to intermarriage and amalgamation. I've seen widespread claims that when the Third Reich devised its 1935 Nuremberg Laws restricting marriage and other social arrangements between Aryans, non-Aryans, and part-Aryans, its experts drew upon some of America's long legal experience in similar matters, and this seems quite plausible. Under that new Nazi statute, pre-existing mixed-marriages received some legal protection, but henceforth Jews and half-Jews could only marry each other, while quarter-Jews could only marry regular Aryans. The obvious intent was to absorb that latter group into mainstream German society, while isolating the more heavily-Jewish population.

Ironically enough, Israel today is one of very few countries with a similar sort of strictly racially-based criteria for citizenship status and other privileges, with the Jewish-only immigration policy now often enforced by DNA testing, and marriages between Jews and non-Jews legally prohibited. A few years ago, the world media also carried the remarkable story of a Palestinian Arab sentenced to prison for rape because he had had consensual sexual relations with a Jewish woman by passing himself off as a fellow Jew.

Since Orthodox Judaism is strictly matrilineal and controls Israeli law, even Jews of other branches can experience unexpected difficulties due to conflicts between personal ethnic identity and official legal status. The vast majority of the wealthier and more influential Jewish families worldwide do not follow Orthodox religious traditions, and over the generations, they have often taken Gentile wives. However, even if the latter had converted to Judaism, their conversions are considered invalid by the Orthodox Rabbinate, and none of their resulting descendants are considered Jewish. So if some members of these families later develop a deep commitment to their Jewish heritage and immigrate to Israel, they are sometimes outraged to discover that they are officially classified as "goyim" under Orthodox law and legally prohibited from marrying Jews. These major political controversies periodically erupt and sometimes reach the international media.

Now it seems to me that any American official who proposed racial DNA tests to decide upon the admission or exclusion of prospective immigrants would have a very difficult time remaining in office, with the Jewish-activists of organizations like the ADL probably leading the attack. And the same would surely be true for any prosecutor or judge who sent non-whites to prison for the crime of "passing" as whites and thereby managing to seduce women from that latter group. A similar fate would befall advocates of such policies in Britain, France, or most

other Western nations, with the local ADL-type organization certainly playing an important role. Yet in Israel, such existing laws merely occasion a little temporary embarrassment when they are covered in the international media, and then invariably remain in place after the commotion has died down and been forgotten. These sorts of issues are considered of little more importance than were the past wartime Nazi ties of the Israeli prime minister throughout most of the 1980s.

But perhaps the solution to this puzzling difference in public reaction lies in an old joke. A leftist wit once claimed that the reason America has never had a military coup is that it is the only country in the world that lacks an American embassy to organize such activities. And unlike the U.S., Britain, France, and many other predominately-white countries, Israel has no domestic Jewish-activist organization filling the powerful role of the ADL.

Over the last few years, many outside observers have noted a seemingly very odd political situation in Ukraine. That unfortunate country possesses powerful militant groups, whose public symbols, stated ideology, and political ancestry all unmistakably mark them as Neo-Nazis. Yet those violent Neo-Nazi elements are all being bankrolled and controlled by a Jewish Oligarch who holds dual Israeli citizenship. Furthermore, that peculiar alliance had been mid-wifed and blessed by some of America's leading Jewish Neocon figures, such as Victoria Nuland, who have successfully used their media influence to keep such explosive facts away from the American public.

At first glance, a close relationship between Jewish Israelis and European Neo-Nazis seems as grotesque and bizarre a misalliance as one could imagine, but after recently reading Brenner's fascinating book, my perspective substantially shifted. Indeed, the main difference between then and now is that during the 1930s, Zionist factions represented a very insignificant junior partner to a powerful Third Reich, while these days it is the Nazis who occupy the role of eager suppliants to the formidable power of International Zionism, which now so heavily dominates the American political system and through it, much of the world.

# Holocaust Denial

August 27, 2018 • 17,600 Words

## *Reason* Magazine and Holocaust Denial

A few years ago I somehow heard about a ferocious online dispute involving a left-leaning journalist named Mark Ames and the editors of *Reason* magazine, the glossy flagship publication of America's burgeoning libertarian movement. Although I was deep in my difficult programming work, curiosity got the better of me, so I decided to take a look.

During the Immigration Wars of the 1990s, I'd become quite friendly with the *Reason* people, frequently visiting their offices, especially during my "English" campaign of 1998, when I'd located my own political headquarters in the same small Westside LA office building they used. As my content-archiving software project began absorbing more and more of my time during the early 2000s, I'd gradually lost touch with them, but even so, the 40-odd years of their magazine archives had become the first publication I'd incorporated into my system, and I was now pleased to discover that both sides in the ongoing feud had put my system to good use in exploring those old *Reason* issues.

Apparently, the libertarians grouped around *Reason* had successfully been making political inroads into Silicon Valley's enormously wealthy technology industry, and had now organized a major conference in San Francisco to gather together their supporters. Their left-leaning rivals decided to nip that project in the bud by highlighting some of the more unsavory ideological positions that mainstream libertarian leaders had once regularly espoused. Perhaps Ron Paul and other libertarians might oppose overseas wars and drug laws, and support cutting taxes and regulations, but they and their Republican Party allies were unspeakably vile on all sorts of other issues, and all "good thinkers" should therefore stay very far away.

The debate began in rather mundane fashion with an article by Ames entitled "Homophobia, Racism, and the Kochs" denouncing *Reason* for sharing a platform with a high-ranking Republican Congresswoman of Christian conservative views, as well as the magazine's reliance upon Koch funding and its alleged support for Apartheid South Africa

during the 1970s and 1980s. The response by the *Reason* editor seemed quite persuasive, and he rightfully dismissed the guilt-by-association attacks. He also outlined the gross errors and omissions in the charges regarding South Africa, and ridiculed Ames as a notoriously error-prone "conspiracy theorist." Surely few outsiders would have paid any attention to such a typical exchange of mudslinging between rival ideological camps.

But then things took a very different turn, and a week later Ames returned with a 5,000 word article bearing a title sure to grab attention: "Holocaust Denial." He claimed that in 1976 *Reason* had published an entire special issue devoted to that explosive topic.

Surely everyone on the Internet has encountered numerous instances of Holocaust Denial over the years, but for a respectable magazine to have allotted a full issue to promoting that doctrine was something else entirely. For decades, Hollywood has sanctified the Holocaust, and in our deeply secular society accusations of Holocaust Denial are a bit like shouting "Witch!" in Old Salem or leveling accusations of Trotskyism in the Court of the Red Czar. Progressive Sam Seder's *Majority Report* radio show devoted a full half-hour segment to the charges against *Reason*, and Googling "Reason Magazine" + "Holocaust Denial" today yields thousands of hits. This substantial explosion of Internet controversy was what caught my own attention at the time.

My initial reaction was one of puzzlement. *Reason* had been the first periodical I had digitized in my system a dozen years earlier, and surely I would have noticed an entire issue promoting Holocaust Denial. However, I soon discovered that February 1976 had been excluded from the supposedly complete set the magazine had shipped me for processing, an omission that itself raises serious suspicions. But Ames had somehow located a copy in a research library and produced a full PDF, which he conveniently placed on the Internet to support his accusations.

Carefully reading his article and then glancing through the contents, I decided that his accusation was technically false but substantially true. Apparently the actual theme of the issue was "Historical Revisionism" and except for a couple of paragraphs buried here and there among the 76 pages, Holocaust Denial never came up, so characterizing it as a Holocaust Denial issue was obviously a grotesque exaggeration. But on the other hand, although few of the authors were familiar to me, it seemed undeniably true that they were numbered among America's more prominent Holocaust Deniers, and most of them were deeply associated with organizations situated in that same camp. Furthermore, there were strong indications that their positions on that topic must certainly have been known to the *Reason* editors who commissioned their pieces.

The clearest case comes when Ames quoted the explicit statements of Dr. Gary North, a prominent libertarian thinker who had served as one of Ron Paul's earliest Congressional aides and later became his longtime partner in politics and business:

> Probably the most far-out materials on World War II revisionism have been the seemingly endless scholarly studies of the supposed execution of 6 million Jews by Hitler. The anonymous author [Hoggan] of ﷺThe Myth of the Six Million' has presented a solid case against the Establishment's favorite horror story—the supposed moral justification for our entry into the war…The untranslated books by the former Buchenwald inmate Prof. Paul Rassinier, have seriously challenged the story…A recent and very inexpensive book in magazine form, *Did Six Million Really Die?*, appeared in 1973, written by Richard Harwood.

A later issue carried a thousand word letter by Prof. Adam Reed of Rockefeller University, a past *Reason* contributor, strongly affirming the mainstream Holocaust narrative by quoting from standard works, and taking Dr. North to task for his citation of Holocaust Denial works of doubtful quality. But North firmly stood his ground:

> ❑The second point, that about 6 million Jews really did die in the concentration camps, is one that will be open until the records of the period become fully available. I am not convinced yet, one way or the other. I am happy to have Dr. Reed's interpretation of the data, but until the publishing companies and academic guild encourage the re-examination of the data, I shall continue to recommend that those interested in revisionist questions read *The Myth of the Six Million* and *Did Six Million Really Die?* as reasonable (though not necessarily irrefutable) pieces of historical revisionism. If a person can't make up his mind, he should do more reading."

Dr. James J. Martin was the lead contributor to the February Revisionism issue, and the preceding January issue had featured an extended Q&A by the editors, with one of the queries directly addressing the controversial topic:

> REASON: Dr. Martin, do you believe (1) that the specific charge against the Nazis of having a mass extermination program of several million Jews is true, and (2) that the Allied atrocities were as great or greater than those of the Germans, from your study of the question?
>
> MARTIN: Well, I never made a head count of all who lost their lives in the War-we've seen a wide variety of statistical materials, some of which have been pulled out of thin air. As a consequence, it's hard to make any kind of estimate of this sort, whether ten more were killed on the one side or the other is not a particularly entrancing subject as far as I'm concerned. Whether allegations can be proven it remains to be seen. I don't believe that the evidence of a planned extermination of the entire Jewish population of Europe is holding up. I have been influenced over the years by the works of Paul Rassinier, and he still has to be reckoned with. His works have been ignored for a long time, and sooner or later somebody's going to have to do a decent job of coping with what he has presented. I think Rassinier's general case is sound at the moment and I haven't seen any strong evidence to upset his allegations or his assertions that there was no planned program for the extermination of European Jews. His

> other main case is that there were no gas chamber extermination programs. The fact that a great many people lost their lives is incontrovertible—that the German concentration camps weren't health centers is well known-but they appear to have been far smaller and much less lethal than the Russian ones.

Another major contributor to the issue was Dr. Austin J. App, and just three years earlier he had published a short book bearing the lurid title *The Six Million Swindle: Blackmailing the German People for Hard Marks with Fabricated Corpses*.

In a follow-up column by Ames' own editor, the stunned reactions of various journalists are listed, with one of them Tweeting out *"I had no idea that Reason Magazine was once a haven for Holocaust Revisionism. Holy Moly."* Despite the angry obfuscations of present-day *Reason* staffers, this description seems quite correct.

Indeed, there seems considerable circumstantial evidence that around that time "Holocaust Skepticism" extended rather broadly within the entire nascent libertarian movement. Aside from the sharp critique of the aforementioned Prof. Reed, the overwhelming majority of the reader responses seemed totally favorable, with Samuel Konkin III, editor of *New Libertarian Weekly* and various similar publications, suggesting that the February issue was one of the best they had ever published. David Nolan, founder of America's Libertarian Party, also praised the issue as "outstanding."

The two editors of the issue in question even today remain quite prominent figures at *Reason* and within American libertarianism, while the masthead then carried names such as David Brudnoy and Alan Reynolds, who both later became influential figures in conservative and libertarian politics. There seems no evidence of any resignations or angry recriminations following the issue's publication, which seems to have been digested with total equanimity, apparently arousing less rancor than might have been generated by a dispute over monetary policy.

I'd never paid much attention to Holocaust discussions over the years, but the name of Murray Rothbard on the 1976 *Reason* masthead prompted a memory. Rothbard is widely regarded as the founder of modern libertarianism, and I recalled in the 1990s reading somewhere that he had often ridiculed the Holocaust as being total nonsense, which had stuck in my mind as a typical example of libertarian eccentricity. A quick Google search seemed to confirm my recollection that Rothbard was an avowed Holocaust Denier.

Although the whole controversy regarding *Reason's* editorial line of the mid-1970s soon died down, it remained a nagging puzzle in the back of my mind. I'd always been quite skeptical of libertarian ideology, but my *Reason* friends from the 1990s had certainly seemed like smart and rational people to me, hardly raving lunatics of any sort, and two of the ones I'd known best had been the co-editors of the controversial issue in question.

I could easily understand how zealous libertarian ideologues might be swept past the point of rationality on certain matters—perhaps arguing that the police and the army should be abolished as statist institutions—but the factual question of what had or had not happened to the Jews of Europe during World War II hardly fell into that sort of category. Furthermore, libertarianism had always attracted a very large Jewish contingent, especially in its upper ranks, and one of the issue editors came from that background, as did Rothbard and numerous others featured on the masthead. While deranged anti-Semitism is not impossible among Jews, I would think that it is somewhat less likely. Clearly something very odd must have been going on.

I was then too busy with my work to focus on the matter, but some months later I had more time, and began a detailed investigation. My first step was to carefully read the *Reason* articles produced by those controversial writers previously unknown to me. Although those pieces were not Holocaust-related, I thought they might give me a sense of their thinking.

To my surprise, the historiography seemed outstandingly good, and almost certainly accurate based on what I had picked up over the years from perfectly mainstream sources. Dr. Martin's long article on the notorious framing of "Tokyo Rose" was probably the best and most comprehensive treatment I had ever encountered on that topic, and Dr. App's analysis of the tragedy of the Sudeten-Germans was equally strong, raising several points I had previously not known. Percy Greaves effectively summarized many of the very suspicious aspects of the Pearl Harbor attack, and although his case for the prosecution against FDR was certainly not airtight, it accorded with the views presented by numerous scholars in other books on the subject. Moreover, his position was seconded by a young Bruce Bartlett, later a prominent Reagan and Bush official, and still later a strong Republican critic of George W. Bush, routinely feted by the *New York Times*. Most of the other writings also seemed of very high

quality, including Dr. North's summary of World War II Revisionism. In general, the academic scholarship of those articles greatly surpassed anything found in opinion magazines of more recent decades, *Reason* itself included. Those so interested can click on the above links, read the articles in question, and decide for themselves.

Back then, *Reason* was a young and struggling magazine, with a shoestring staff and budget. Publishing articles of such obvious quality was surely a remarkable achievement for which the editors could feel justifiably proud, and the overwhelmingly positive letters they received seemed absolutely warranted. Meanwhile, the nasty attacks by Ames appeared to be those of a mere political hack who may not have even bothered actually reading the articles whose authors he vilified.

As a further sign of Ames' dishonesty, he flung the epithet "Nazi" some two dozen times in his hack-job, along with numerous uses of "anti-Semitic" as well, and Greaves was certainly the subject of many of those slurs. But although Greaves and Bartlett wrote back-to-back articles on exactly the same Pearl Harbor topic, and according to Wikipedia, the former was the academic advisor to the latter on that subject, Bartlett's name appears nowhere in Ames's hit-piece, presumably because denouncing a prominent policy expert much beloved by the *New York Times* as an "anti-Semitic Neo-Nazi" might prove self-defeating. Even leaving that aside, accusing the Jewish libertarians running *Reason* of being Nazi propagandists must surely be the sort of charge that would strain the credulity of even the most gullible.

## Deborah Lipstadt and Holocaust Denial

With Ames' credibility totally shredded, I decided to carefully reread his article again, looking for what clues I could find to the whole bizarre situation. Academic scholars who publish very good history on certain subjects might still have totally irrational views on others, but normally one would assume otherwise.

It appeared that much of Ames' understanding of the issue had come from a certain Deborah Lipstadt, whom he characterized as a great Holocaust expert. Her name was very vaguely familiar to me as some sort of academic activist, who years before had won a major legal victory over a rightwing British historian named David Irving, and Irving himself received further denunciations in the Ames article.

However, one name did stick out. Apparently based on Lipstadt's information, Ames described Harry Elmer Barnes as "the godfather of American Holocaust denial literature" and Martin's "Holocaust denial guru."

A dozen years earlier, the name "Barnes" would have meant almost nothing to me. But as I produced my content-archiving system and digitized so many of America's most influential publications of the last 150 years, I had soon discovered that many of our most illustrious public intellectuals—Left, Right, and Center—had been suddenly purged and "disappeared" around 1940 because of their stalwart opposition to FDR's extremely aggressive foreign policy, and Barnes, an eminent historian and sociologist, had been among the most prominent of those. He had been one of the earliest editors at *Foreign Affairs* and for many years afterward his important articles had graced the pages of *The New Republic* and *The Nation*, while even after his fall, he had edited *Perpetual War for Perpetual Peace*, an important 1953 collection of essays by himself and other once-prominent figures. But to have a figure of such intellectual stature accused of being a Holocaust Denier, let alone the "godfather" of the entire movement, seemed rather bizarre to me.

Since Ames was merely an ignorant political hack transmitting the opinions of others, I focused on Lipstadt, his key source. Anyone who has spent much time on the comment-threads of relatively unfiltered websites has certainly encountered the controversial topic of Holocaust Denial, but I now decided to try to investigate the issue in much more serious fashion. A few clicks on the Amazon.com website,

and her 1993 book *Denying the Holocaust* arrived in my mailbox a couple of days later, providing me an entrance into that mysterious world.

Reading the book was certainly a tremendous revelation to me. Lipstadt is a professor of Holocaust Studies with an appointment in Emory University's Department of Theology, and once I read the opening paragraph of her first chapter, I decided that her academic specialty might certainly be described as "Holocaust Theology."

> The producer was incredulous. She found it hard to believe that I was turning down an opportunity to appear on her nationally televised show. "But you are writing a book on this topic. It will be great publicity." I explained repeatedly that I would not participate in a debate with a Holocaust denier. The existence of the Holocaust was not a matter of debate. I would analyze and illustrate who they were and what they tried to do, but I would not appear with them…Unwilling to accept my no as final, she vigorously condemned Holocaust denial and all it represented. Then, in one last attempt to get me to change my mind, she asked me a question: "I certainly don't agree with them, but don't you think our viewers should hear the *other side*?"

Lipstadt's absolute horror at having someone actually dispute the tenets of her academic doctrine could not have been more blatant. Surely no zealous theologian of the European Dark Ages would have reacted any differently.

The second chapter of her book supported that impression. Since many of the individuals she castigates as Holocaust Deniers also supported the Revisionist perspective of the underlying causes of the First and Second World Wars, she harshly attacked those schools, but in rather strange fashion. In recent years, blogger Steve Sailer and others have ridiculed what they describe as the "point-and-sputter" style of debate, in which a "politically-incorrect" narrative is merely described and then automatically treated as self-evidently false without any accompanying need for actual refutation. This seemed to be the approach that Lipstadt took throughout her rather short book.

For example, she provided a very long list of leading academic scholars, prominent political figures, and influential journalists who had championed Revisionist history, noted that their views disagree with the more mainstream perspective she had presumably imbibed from her History 101 textbooks, and thereby regarded them as fully debunked. Certainly a Christian preacher attempting to refute the

evolutionary theories of Harvard's E.O. Wilson by quoting a passage of Bible verse might take much the same approach. But few evangelical activists would be so foolish as to provide a very long list of eminent scientists who all took the same Darwinist position and then attempt to sweep them aside by citing a single verse from Genesis. Lipstadt seems to approach history much like a Bible-thumper, but a particularly dim-witted one. Moreover, many of the authors she attacked had already become familiar to me after a decade of my content-archiving work, and I had found their numerous books quite scholarly and persuasive.

Barnes, in particular, figured quite prominently in Lipstadt's chapter and throughout her book. The index listed his name on more than two dozen pages, and he is repeatedly described as the "godfather" of Holocaust Denial, and its seminal figure. Given such heavy coverage, I eagerly examined all those references and the accompanying footnotes to uncover the shocking statements he must have made during his very long scholarly career.

I was quite disappointed. There was not a single reference I could find to his supposed Holocaust Denial views until just the year before his death at age 79, and even that item is hardly what I had been led to believe. In a 9,300 word article on Revisionism for a libertarian publication, he ridicules a leading Holocaust source for claiming that Hitler had killed 25 million Jews, noting that total was nearly twice their entire worldwide population at the time. In addition, Barnes several times applied the word "allegedly" to the stories of the Nazi extermination scheme, a sacrilegious attitude that appears to have horrified a theologian such as Lipstadt. Finally, in a short, posthumously published review of a book by French scholar Paul Rassiner, Barnes found his estimate of just 1 million to 1.5 million Jewish deaths quite convincing, but his tone suggested that he had never previously investigated the matter himself.

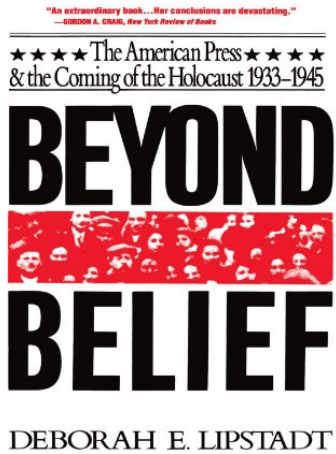
So although that last item technically validated Lipstadt's accusation that Barnes was a Holocaust Denier, her evidence-free claims that he was the founder and leader of the field hardly enhanced her scholarly credibility. Meanwhile, all the many tens of thousands of words I had read by Barnes suggested that he was a careful and dispassionate historian.

A notorious incident that occurred soon after the Bolshevik Revolution came to my mind. Eminent philologist Timofei Florinsky, one of Russia's most internationally renowned academic scholars, was hauled before a revolutionary tribunal for a public interrogation about his

views, and one of the judges, a drunken Jewish former prostitute, found his answers so irritating that she drew her revolver and shot him dead right there and then. Given Lipstadt's obvious emotional state, I had a strong suspicion that she might have wished she could deal in a similar fashion with Barnes and the numerous other scholars she denounced. Among other things, she noted with horror that more than two decades after his 1940 purge from public life, Barnes' books were still required reading at both Harvard and Columbia.

All of us reasonably extrapolate what we already know or can easily check against what is more difficult to verify, and the remaining chapters of Lipstadt's book left me very doubtful about the reliability of her work, all of which was written in a similar near-hysterical style. Since she had already been vaguely known to me from her well-publicized legal battle against historian David Irving more than a dozen years earlier, I was hardly surprised to discover that many pages were devoted to vilifying and insulting him in much the same manner as Barnes, so I decided to investigate that case.

I was only slightly surprised to discover that Irving had been one of the world's most successful World War II historians, whose remarkable documentary findings had completely upended our knowledge of that conflict and its origins, with his books selling in the many millions. His entire approach to controversial historical issues was to rely as much as possible upon hard documentary evidence, and his total inability to locate any such documents relating to the Holocaust drove Lipstadt and her fellow ethnic-activists into a frenzy of outrage, so after many years of effort they finally managed to wreck his career. Out of curiosity, I read a couple of his shorter books, which seemed absolutely outstanding historiography, written in a very measured tone, quite different from that of Lipstadt, whose own 2005 account of her legal triumph over Irving, *History on Trial*, merely confirmed my opinion of her incompetence.



"An extraordinary book...Her conclusions are devastating."

★★★★ The American Press ★★★★
& the Coming of the Holocaust 1933–1945
BEYOND
BELIEF
DEBORAH E. LIPSTADT

Lipstadt's first book *Beyond Belief*, published in 1986, tells an interesting story as well, with her descriptive subtitle being "The American Press and the Coming of the Holocaust, 1933-1945." Much of the volume consists of press clippings from the American print media of that era interspersed with her rather hysterical running commentary, but providing little analysis or judgment. Some of the journalists reported horrifying conditions for Jews in pre-war Germany while others claimed that such stories were wildly exaggerated, with Lipstadt automatically praising the former and denouncing the latter without providing any serious explanation.

Lenni Brenner's remarkable book *Zionism in the Age of the Dictators* had been published three years earlier. Although I only discovered it very recently, any half-competent specialist in her own topic would surely have noticed it, yet Lipstadt provided no hint of its existence. Perhaps the reality of the important Nazi-Zionist economic partnership of the 1930s, with Nazi officials traveling to Palestine as honored Zionist guests and leading Nazi newspapers praising the Zionist enterprise might have complicated her simple story of fanatic German Jew-hatred under Hitler steadily rising towards an exterminationist pitch. Her faculty appointment in a Department of Theology seemed very apt.

Lipstadt's wartime coverage was just as bad, perhaps worse. She cataloged perhaps a couple of hundred print news reports, each describing the massacre of hundreds of thousands or even millions of Jews by the Nazis. But she expressed her outrage that so many of these reports were buried deep within the inside pages of newspapers,

a placement suggesting that they were regarded as hysterical wartime atrocity propaganda and probably fictional, with the editors sometimes explicitly stating that opinion. Indeed, among these under-emphasized stories was the claim that the Germans had recently killed 1.5 million Jews by individually injecting each one of them in the heart with a lethal drug. And although I don't see any mention of it, around that same time America's top Jewish leader Rabbi Stephen Wise was peddling the absurd report that the Nazis had slaughtered millions of Jews, turning their skins into lampshades and rendering their bodies into soap. Obviously, separating truth from falsehood during a blizzard of wartime propaganda was not nearly as easy as Lipstadt seemed to assume.

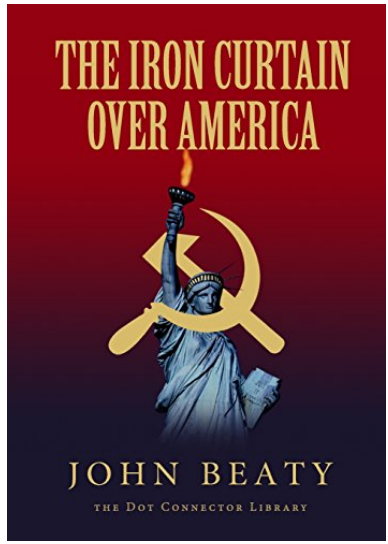
Ordinary Americans were apparently even more skeptical than newspaper editors. According to Lipstadt:

> Writing in the Sunday *New York Times Magazine*, [Arthur] Koestler cited public opinion polls in the United States in which nine of ten average Americans dismissed the accusations against the Nazis as propaganda lies and flatly stated that they did not believe a word of them.

Lipstadt convincingly demonstrated that very few Americans seem to have believed in the reality of the Holocaust during the Second World War itself, despite considerable efforts by agitated Jewish activists to persuade them. Over the years, I have seen mention of numerous other books making this same basic point, and therefore harshly condemning the American political leaders of the time for having failed "to save the Jews."

## Explicit and Implicit Holocaust Denial After World War II

Yet as I began further investigating the history of Holocaust Denial in the wake of the *Reason* contretemps, I was very surprised to discover that this same pattern of widespread disbelief in the Holocaust seems to have continued unabated *after* the end of the war and throughout the 1950s, being especially strong among high-ranking American military figures, especially top generals and individuals with an Intelligence background, who seemingly would have had the best knowledge of the true events.



Some years ago, I came across a totally obscure 1951 book entitled *Iron Curtain Over America* by John Beaty, a well-regarded university professor. Beaty had spent his wartime years in Military Intelligence, being tasked with preparing the daily briefing reports distributed to all top American officials summarizing available intelligence information acquired during the previous 24 hours, which was obviously a position of considerable responsibility.

As a zealous anti-Communist, he regarded much of America's Jewish population as deeply implicated in subversive activity, therefore constituting a serious threat to traditional American freedoms. In particular, the growing Jewish stranglehold over publishing and the media was making it increasingly difficult for discordant views to reach the American people, with this regime of censorship constituting the "Iron Curtain" described in his title. He blamed Jewish interests for the totally unnecessary war with Hitler's Germany, which had long sought good relations with America, but instead had suffered total destruction for its strong opposition to Europe's Jewish-backed Communist menace.

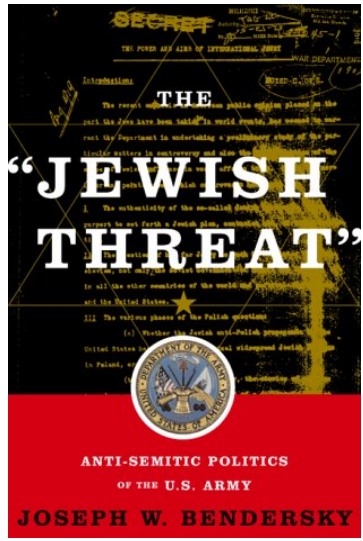
Beaty also sharply denounced American support for the new state of Israel, which was potentially costing us the goodwill of so many millions of Muslims and Arabs. And as a very minor aside, he also criticized the Israelis for continuing to claim that Hitler had killed six million Jews, a highly implausible accusation that had no apparent basis in reality and seemed to be just a fraud concocted by Jews and Communists, aimed at poisoning our relations with postwar Germany and extracting money for the Jewish State from the long-suffering

German people.

Furthermore, he was scathing toward the Nuremberg Trials, which he described as a “major indelible blot” upon America and “a travesty of justice.” According to him, the proceedings were dominated by vengeful German Jews, many of whom engaged in falsification of testimony or even had criminal backgrounds. As a result, this “foul fiasco” merely taught Germans that “our government had no sense of justice.” Sen. Robert Taft, the Republican leader of the immediate postwar era took a very similar position, which later won him the praise of John F. Kennedy in *Profiles in Courage*. The fact that the chief Soviet prosecutor at Nuremberg had played the same role during the notorious Stalinist show trials of the late 1930s, during which numerous Old Bolsheviks confessed to all sorts of absurd and ridiculous things, hardly enhanced the credibility of the proceedings to many outside observers.

Then as now, a book taking such controversial positions stood little chance of finding a mainstream New York publisher, but it was soon released by a small Dallas firm, and then became enormously successful, going through some seventeen printings over the next few years. According to Scott McConnell, founding editor of *The American Conservative*, Beaty’s book became the second most popular conservative text of the 1950s, ranking only behind Russell Kirk’s iconic classic, *The Conservative Mind*.

Moreover, although Jewish groups including the ADL harshly condemned the book, especially in their private lobbying, those efforts provoked a backlash, and numerous top American generals, both serving and retired, wholeheartedly endorsed Beaty’s work, denouncing the ADL efforts at censorship and urging all Americans to read the volume. Although Beaty’s quite explicit Holocaust Denial might shock tender modern sensibilities, at the time it seems to have caused barely a ripple of concern and was almost totally ignored even by the vocal Jewish critics of the work.



Much of this very interesting story is told by Joseph Bendersky, an expert in Holocaust Studies, who devoted ten years of archival research to his 2000 book *The "Jewish Threat."* His work chronicles the extremely widespread anti-Semitism found within the U.S. Army and Military Intelligence throughout the first half of the twentieth century, with Jews being widely regarded as posing a serious security risk. The book runs well over 500 pages, but when I consulted the index I found no mention of the Rosenbergs nor Harry Dexter White nor any of the other very numerous Jewish spies revealed by the Venona Decrypts, and the term "Venona" itself is also missing from the index. Reports of the overwhelmingly Jewish leadership of the Russian Bolsheviks are mostly treated as bigotry and paranoia, as are descriptions of the similar ethnic skew of America's own Communist Party, let alone the heavy financial support of the Bolsheviks by Jewish international bankers. At one point, he dismisses the link between Jews and Communism in Germany by noting that "less than half" of the Communist Party leadership was Jewish; but since fewer than one in a hundred Germans came from that ethnic background, Jews were obviously over-represented among Communist leaders by as much as 5,000%. This seems to typify the sort of dishonesty and innumeracy I have regularly encountered among Jewish Holocaust experts.

Meanwhile, with the copyright having long lapsed, I'm pleased to add Beaty's work to my Controversial HTML Books selection, so individuals interested can read it and decide for themselves:

- The Iron Curtain Over America
  John Beaty • 1951 • 82,000 Words

Beaty's very brief 1951 discussion has been the earliest instance of explicit Holocaust Denial I have managed to locate, but the immediate postwar years seem absolutely rife with what might be described as "implicit Holocaust Denial," especially within the highest political circles.

Over the years, Holocaust scholars and activists have very rightfully emphasized the absolutely unprecedented nature of the historical events they have studied. They describe how some six million innocent Jewish civilians were deliberately exterminated, mostly in gas chambers, by one of Europe's most highly cultured nations, and emphasize that monstrous project was often accorded greater priority than Germany's own wartime military needs during the country's desperate struggle for survival. Furthermore, the Germans also undertook enormous efforts to totally eliminate all possible traces of their horrifying deed, with huge resources expended to cremate all those millions of bodies and scatter the ashes. This same disappearance technique was even sometimes applied to the contents of their mass graves, which were dug up long after initial burial, so that the rotting corpses could then be totally incinerated and all evidence eliminated. And although Germans are notorious for their extreme bureaucratic precision, this immense wartime project was apparently implemented without benefit of a single written document, or at least no such document has ever been located.

Lipstadt entitled her first book "Beyond Belief," and I think that all of us can agree that the historical event she and so many others in academia and Hollywood have made the centerpiece of their lives and careers is certainly one of the most extremely remarkable occurrences in all of human history. Indeed, perhaps only a Martian Invasion would have been more worthy of historical study, but Orson Welles's famous *War of the Worlds* radio-play which terrified so many millions of Americans in 1938 turned out to be a hoax rather than real.

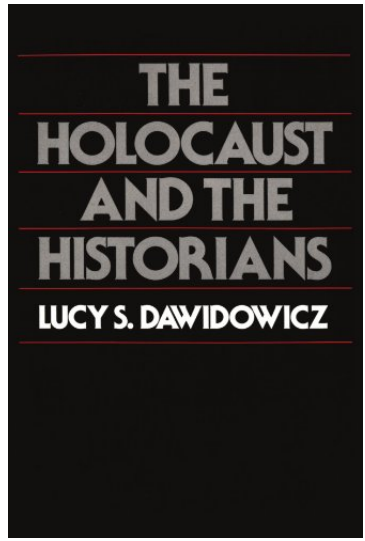
The six million Jews who died in the Holocaust certainly constituted a very substantial fraction of all the wartime casualties in the European Theater, outnumbering by a factor of 100 all the British who died during the Blitz, and being dozens of times more numerous than all the Americans who fell there in battle. Furthermore, the sheer monstrosity of the crime against innocent civilians would surely have provided the best possible justification for the Allied war effort. Yet for many, many years after the war, a very strange sort of amnesia seems to have gripped most of the leading political protagonists in

that regard.

Robert Faurisson, a French academic who became a prominent Holocaust Denier in the 1970s, once made an extremely interesting observation regarding the memoirs of Eisenhower, Churchill, and De Gaulle:

> Three of the best known works on the Second World War are General Eisenhower's *Crusade in Europe* (New York: Doubleday [Country Life Press], 1948), Winston Churchill's *The Second World War* (London: Cassell, 6 vols., 1948-1954), and the *Mémoires de guerre* of General de Gaulle (Paris: Plon, 3 vols., 1954-1959). In these three works not the least mention of Nazi gas chambers is to be found.
>
> Eisenhower's *Crusade in Europe* is a book of 559 pages; the six volumes of Churchill's *Second World War* total 4,448 pages; and de Gaulle's three-volume *Mémoires de guerre* is 2,054 pages. In this mass of writing, which altogether totals 7,061 pages (not including the introductory parts), published from 1948 to 1959, one will find no mention either of Nazi "gas chambers," a "genocide" of the Jews, or of "six million" Jewish victims of the war.

Given that the Holocaust would reasonably rank as the single most remarkable episode of the Second World War, such striking omissions must almost force us to place Eisenhower, Churchill, and De Gaulle among the ranks of "implicit Holocaust Deniers."



Many others seem to fall into that same category. In 1981, Lucy S. Dawidowicz, a leading Holocaust scholar, published a short book entitled *The Holocaust and the Historians*, in which she denounced so many prominent historians for having totally ignored the reality of the Holocaust for many years following World War II. Indeed, discussion of that topic was almost entirely confined to the Jewish Studies programs which committed ethnic activists had newly established at numerous universities throughout the country. Although Lipstadt's poor scholarly habits and hysterical style hardly impressed me, she appears to have been among the most successful academics who began a career in those ethnic studies departments, which suggests that their average quality was far below her own.

Meanwhile, Dawidowicz emphasized that mainstream histories often entirely omitted the Holocaust from their presentations:

> But it is plain from the most cursory review of textbooks and scholarly works by English and American historians that the awesome events of the Holocaust have not been given their historic due. For over two decades some secondary school and college texts never mentioned the subject at all, while others treated it so summarily or vaguely as to fail to convey sufficient information about the events themselves or their historical significance.

With regard to serious scholarship, she notes that when Friedrich Meinecke, universally acknowledged as Germany's most eminent historian, published *The German Catastrophe* in 1946, he harshly denounced Hitler as the leader of "a band of criminals" but made

absolutely no mention of the Holocaust, which surely would have represented the height of such criminality. Major British accounts of Hitler and World War II by leading historians such as A.J.P. Taylor, H.R. Trevor-Roper, and Alan Bullock were almost as silent. A similar situation occurred in America as late as 1972 when the massive 1,237 page *Columbia History of the World*, having a Jewish co-editor, devoted a full chapter to World War II but confined its discussion of the Holocaust to just two short and somewhat ambiguous sentences. One almost gets a sense that many of these experienced professional historians regarded discussion of the Holocaust as a considerable embarrassment, a subject that they sought to avoid or at least completely minimize.

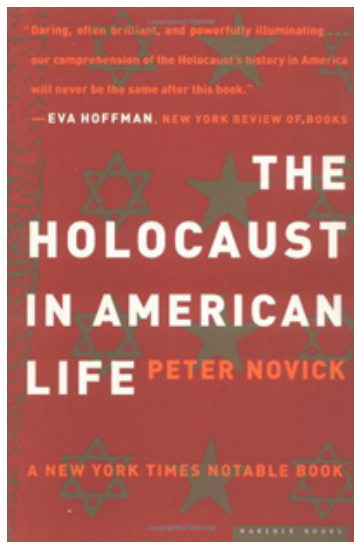
Dawidowicz even castigates *Slaughterhouse-Five*, the 1969 fictional masterpiece by Kurt Vonnegut, for its bald assertion that the firebombing of Dresden was "the greatest massacre in European history," a claim that seems to reduce the Holocaust to non-existence.

I myself had noticed something similar just a couple of years before Dawidowicz's book appeared. The English translation of German journalist Joachim Fest's widely praised *Hitler* had been published in 1974 and I had read it a few years later, finding it just as excellent as the critics had indicated. But I remember being a little puzzled that the 800 page book contained no more than a couple of pages discussing the Nazi death camps and the word "Jews" never even appeared in the index.

The vast majority of Hitler's Jewish victims came from Russia and the Eastern European nations included in the Soviet Bloc. That was also the location of all the extermination camps that are the central focus of Holocaust scholars, and therefore the Soviets were the source of most of the key evidence used at the Nuremberg Trials. Yet Dawidowicz notes that after Stalin grew increasingly suspicious of Jews and Israel a few years after the end of the war, virtually all mention of the Holocaust and German wartime atrocities against Jews vanished from the Soviet media and history books. A similar process occurred in the Warsaw Pact satellites, even while the top Communist Party leadership of many of those countries often remained very heavily Jewish for some years. Indeed, I recall reading quite a number of newspaper articles mentioning that after the Berlin Wall fell and the sundered halves of Europe were finally reunited, most Eastern Europeans had never even heard of the Holocaust.

These days, my morning newspapers seem to carry Holocaust-related stories with astonishing frequency, and probably no event of the

twentieth century looms so large in our public consciousness. According to public survey data, even as far back as 1995, some 97% of Americans knew of the Holocaust, far more than were aware of the Pearl Harbor attack or America's use of the atomic bombs against Japan, while less than half our citizenry were aware that the Soviet Union had been our wartime ally. But I'd suspect that anyone who drew his knowledge from the mainstream newspapers and history books during the first couple of decades after the end of the Second World War might never have even been aware that any Holocaust had actually occurred.



"Daring, often brilliant, and powerfully illuminating . . . our comprehension of the Holocaust's history in America will never be the same after this book."
—EVA HOFFMAN, NEW YORK REVIEW OF BOOKS
THE HOLOCAUST IN AMERICAN LIFE
PETER NOVICK
A NEW YORK TIMES NOTABLE BOOK

In 1999 Peter Novick published a book on this general theme entitled *The Holocaust in American Life,* citing that survey, and his introduction began by noting the very strange pattern the Holocaust exhibited in its cultural influence, which seems quite unique among all major historical events. In the case of almost all other searing historical occurrences such as the massive bloodshed of the Somme or the bitter Vietnam War, their greatest impact upon popular consciousness and media came soon afterward, with the major books and films often appearing within the first five or ten years when memories were fresh, and the influence peaking within a couple of decades, after which they were gradually forgotten.

Yet in the case of the Holocaust, this pattern was completely reversed. Hardly anyone discussed it for the first twenty years after the end of the World War II, while it gradually moved to the center of American life in the 1970s, just as wartime memories were fading and many of the most prominent and knowledgeable figures from that era had departed the scene. Novick cites numerous studies and surveys

demonstrating that this lack of interest and visibility certainly included the Jewish community itself, which had seemingly suffered so greatly under those events, yet apparently had almost completely forgotten about them during the 1950s and much of the 1960s.

I can certainly confirm that impression from my personal experience. Prior to the mid- or late-1970s, I had had only the vaguest impression that virtually all the Jews and Gypsies of Europe had been exterminated during the Second World War, and although the term "Holocaust" was in widespread use, it invariably referred to a "Nuclear Holocaust," a term long-since supplanted and scarcely used today. Then, after the Berlin Wall fell, I was quite surprised to discover that Eastern Europe was still filled with vast numbers of unexterminated Gypsies, who quickly flooded into the West and provoked all sorts of political controversies.

## The Rediscovery of the Holocaust

The late scholar Raul Hilberg is universally acknowledged as the founder of modern Holocaust studies, which began with the 1961 publication of his massive volume *The Destruction of the European Jews*. In his very interesting 2007 Hilberg obituary, historian Norman Finkelstein emphasizes that prior to Hilberg's work, there had been virtually no writing on the Holocaust, and discussion of the topic was considered almost "taboo." For a recent event of such apparent enormity to have been so completely wiped away from public discussion and the consciousness of historians and political scientists can be explained in several different ways. But once I began to investigate the circumstances behind Hilberg's ground-breaking work, I encountered all sorts of strange ironies.

According to Wikipedia, Hilberg's family of Austrian Jews coincidentally arrived in the United States on the exact day in 1939 that war broke out, and in his early teens he was soon horrified to read all the news reports of the ongoing extermination of his fellow Jews in the continent his family had left behind, even telephoning Jewish leaders asking why they were doing so little to save their kinsmen from annihilation. He subsequently served in the U.S. military in Europe, then majored in Political Science at Brooklyn College after the end of the conflict. The inspiration for his future scholarly focus seems to have come when he was shocked by a remark made by one of his lecturers, Hans Rosenberg:

> The most wicked atrocities perpetrated on a civilian population in

modern times occurred during the Napoleonic occupation of Spain.

When Hilberg asked how Rosenberg, himself a German-Jewish refugee, could have so totally ignored the murder of 6 million Jews, a monstrous crime committed just a couple of years earlier, Rosenberg sought to deflect the question, saying that "it was a complicated matter" and "history doesn't teach down into the present age." Since Rosenberg was a student of Meinecke, whom Lipstadt has bitterly denounced as an implicit Holocaust Denier, one wonders whether Rosenberg may have shared the beliefs of his mentor but was reluctant to admit that fact to his overwhelmingly Jewish students in emotionally-charged postwar Brooklyn.

Later, Hilberg conducted his doctoral research at Columbia under Franz Neumann, another German-Jewish refugee scholar. But when Hilberg indicated he wanted his research to focus on the extermination of Europe's Jews, Neumann strongly discouraged that topic, warning Hilberg that doing so would be professionally imprudent and might become "his academic funeral." When he attempted to publish his research in book form, it received numerous negative reviews, with Israel's Yad Vashem fearing it would encounter "hostile criticism," and over a six year period, it was rejected by several major publishing houses along with Princeton University, based on the advice of the influential Jewish intellectual Hannah Arendt. One naturally wonders whether all these established scholars may have quietly known something that a naive young doctoral candidate such as Hilberg did not. His book only appeared in print because a Jewish immigrant whose business had suffered under the Nazis funded the entire publication.

I'd never paid much attention to Holocaust issues, but the supporters of my local Palo Alto Library operate a monthly book sale, and with serious nonfiction hardcovers often priced at just a quarter each, my personal library has grown by hundreds of volumes over the years, now including several of the thickest and most influential Holocaust texts. Aside from Hilberg's classic volume, these include Nora Levin's *The Holocaust* (1968), Lucy Dawidowicz's *The War Against the Jews, 1933-1945* (1975), Martin Gilbert's *The Holocaust* (1985), and Daniel Goldhagen's *Hitler's Willing Executioners* (1996).

I claim absolutely no expertise in Holocaust issues, and analyzing the evidence and argumentation these voluminous works offer is entirely

beyond my ability. But I decided to attempt to assess their overall credibility by exploring a few particular items, without actually bothering to read the thousands of pages of text they encompassed.

Consider the interesting case of Field Marshal Erhard Milch, Hermann Goering's very powerful number-two in the German Luftwaffe. His father was certainly a Jew, and according to researchers Robert Wistrich and Louis Snyder, there is archival evidence that his mother was Jewish as well. Now it is certainly not impossible that a Third Reich supposedly dedicated with grim fanaticism to the extermination of each and every Jew might have spent the entire war with a full- or half-Jew near the absolute top of its military hierarchy, but surely that puzzling anomaly would warrant careful explanation, and Milch's apparent Jewish background was certainly known during the Nuremberg Trials.

Yet when I carefully consulted the very comprehensive indexes of those five books, totaling over 3,500 pages, there is virtually no discussion of Milch, except a few very brief mentions of his name in connection with various military operations. Either the authors were unaware of Milch's Jewish background, or perhaps they hoped to keep that fact away from their readers lest it cause "confusion." Neither of these possibilities enhances the trust we should place in their research skills or their scholarly objectivity.

Indeed, the fascinating and widely-praised 2002 book *Hitler's Jewish Soldiers* by Bryan Mark Rigg notes that aside from Milch, Hitler's military contained over a dozen half-Jewish generals and admirals and another dozen quarter-Jews of that same high rank, plus a total of roughly 150,000 additional half- or quarter-Jewish soldiers, with a large fraction of these being officers. All of these individuals would have had some fully-Jewish parents or grand-parents, which seems decidedly odd behavior for a regime supposedly so focused on the total eradication of the Jewish race.

Another obvious matter casts further doubt upon the historical quality of those five immensely thick volumes of standard Holocaust narrative, which together occupy nearly a linear foot on my bookshelves. For prosecutors of any crime, establishing a plausible motive is certainly an important goal, and in the case of the Jewish Holocaust, these authors would seem to have an easy task at hand. Hitler and his German colleagues had always claimed that the Jews overwhelmingly dominated Bolshevik Communism, and much of their struggle against the former was in order to prevent further bloody deeds of the latter. So surely devoting an early chapter or so to

describing this central Nazi doctrine would provide an airtight explanation of what drove the Nazis to their fiendish slaughters, rendering fully explicable the horrifying events that would occupy the remainder of their text.

Yet oddly enough, an examination of their indexes for “Bolsheviks,” “Communism,” and all variants reveals almost no discussion of this important issue. Goldhagen’s 1996 book provides just a couple of short sentences spread across his 600 pages, and the other works seem to contain virtually nothing at all. Since all of these Holocaust books almost totally avoid Hitler’s self-declared motive for his anti-Jewish actions, they are forced to desperately search for alternative explanations, seeking clues buried deep within the German past or turning to psychanalytical speculations or perhaps deciding that what they describe as the greatest massacre in all human history was undertaken out of sheer Nazi wickedness.

The obvious reason for this glaring omission is that the authors are constructing a morality-play in which the Jews must be portrayed as absolutely blameless victims, and even hinting at their role in the numerous Communist atrocities that long preceded the rise of the Third Reich might cause readers to consider both sides of the issue. When purported historians go to absurd lengths to hide such glaring facts, they unmask themselves as propagandists, and we must be very cautious about trusting their reliability and candor in all other matters, whether great or small.

Indeed, the topic of Communism raises a far larger issue, one having rather touchy implications. Sometimes two simple compounds are separately inert, but when combined together may possess tremendous explosive force. From my introductory history classes and readings in high school, certain things had always seemed glaringly obvious to me even if the conclusions remained unmentionable, and I once assumed they were just as apparent to most others as well. But over the years I have begun to wonder whether perhaps this might not be correct.

Back in those late Cold War days, the death toll of innocent civilians from the Bolshevik Revolution and the first two decades of the Soviet Regime was generally reckoned at running well into the tens of millions when we include the casualties of the Russian Civil War, the government-induced famines, the Gulag, and the executions. I’ve heard that these numbers have been substantially revised downwards to perhaps as little as twenty million or so, but no matter. Although

determined Soviet apologists may dispute such very large figures, they have always been part of the standard narrative history taught within the West.

Meanwhile, all historians know perfectly well that the Bolshevik leaders were overwhelmingly Jewish, with three of the five revolutionaries Lenin named as his plausible successors coming from that background. Although only around 4% of Russia's population was Jewish, a few years ago Vladimir Putin stated that Jews constituted perhaps 80-85% of the early Soviet government, an estimate fully consistent with the contemporaneous claims of Winston Churchill, *Times of London* correspondent Robert Wilton, and the officers of American Military Intelligence. Recent books by Alexander Solzhenitsyn, Yuri Slezkine, and others have all painted a very similar picture. And prior to World War II, Jews remained enormously over-represented in the Communist leadership, especially dominating the Gulag administration and the top ranks of the dreaded NKVD.

Both of these simple facts have been widely accepted in America throughout my entire lifetime. But combine them together with the relatively tiny size of worldwide Jewry, around 16 million prior to World War II, and the inescapable conclusion is that in per capita terms Jews were the greatest mass-murderers of the twentieth century, holding that unfortunate distinction by an enormous margin and with no other nationality coming even remotely close. And yet, by the astonishing alchemy of Hollywood, the greatest killers of the last one hundred years have somehow been transmuted into being seen as the greatest victims, a transformation so seemingly implausible that future generations will surely be left gasping in awe.

Today's American Neocons are just as heavily Jewish as were the Bolsheviks of a hundred years ago, and they have greatly benefited from the political immunity provided by this totally bizarre inversion of historical reality. Partly as a consequence of their media-fabricated victimhood status, they have managed to seize control over much of our political system, especially our foreign policy, and have spent the last few years doing their utmost to foment an absolutely insane war with nuclear-armed Russia. If they do manage to achieve that unfortunate goal, they will surely outdo the very impressive human body-count racked up by their ethnic ancestors, perhaps even by an order-of-magnitude or more.

## Holocaust Frauds and Confusions

Since the Holocaust only became a major public topic after wartime memories had grown dim, the story has always seemed to suffer from the problems traditionally associated with "recovered memory syndrome." Truths and falsehoods were often mixed together in strange ways, and the door was opened wide to an astonishing number of outright frauds and liars.

For example, in the late 1970s I remember many of my high school classmates devouring *The Painted Bird* by Jerzy Kosinski, perhaps the first widely popular Holocaust memoir. But then a few years later, the media revealed that Kosinski's national best-seller was simply fraudulent, and the plagiarizing author eventually committed suicide. Indeed, there have been so many fake Holocaust memoirs over the years that they nearly constitute a literary genre of their own.

Probably the most world's most famous Holocaust survivor was Elie Wiesel, who parlayed the stories of his wartime suffering into becoming an enormous political celebrity. His career was capped with a Nobel Peace Prize in 1986, and the announcement declared him "a messenger to mankind." Yet journalist Alexander Cockburn has persuasively argued that Wiesel was simply a fraud, and his famous autobiographical work *Night* just another literary hoax.

Although the iconic figure of "the Six Million" has been endlessly repeated by our media, the estimated numbers of the dead have actually been shockingly variable over the years. Although I never paid much attention to Holocaust issues, I have closely read my major newspapers and magazines for decades, and had regularly seen the statement that the Nazi death machine had brutally exterminated five million Gentiles along with the six million Jews. But just last year, I was stunned to discover that former total was simply a whole-cloth invention by prominent Holocaust-activist Simon Wiesenthal, who simply made the figure up one day with the intent of giving non-Jews more of a stake in the Holocaust story. And despite being based on absolutely no evidence or research, his casual claim was never effectively refuted by actual Holocaust scholars, who knew it to be total nonsense, and therefore it was so regularly repeated in the media that I probably read it hundreds of times over the years, always assuming it had some firm grounding in proven reality.

Similarly, for decades I had always read the undeniable fact that the Nazis had exterminated 4 million inmates at Auschwitz, with most of the victims being Jews, and Lipstadt certainly treated that number as absolutely rock-solid historical reality. But in the early 1990s after the fall of Communism, the official total was quietly revised downwards

to as little as 1.1 million. The fact that a sudden reduction in the official Holocaust body-count by 3 million has had so little impact upon our public Holocaust media narrative hardly seems to inspire great confidence in either the total figures or the media reporting of them.

The New York Times
Expect the World
"Holocaust" and "6 million Jews" stories brought to you ever since 1869 by Jew-owned "Newspaper of Record"

Over the last couple of generations, our media has engraved that figure of Six Million so deeply onto the minds of every Western citizen that the meaning of the iconic number is universally understood, and those who question it risk a prison sentence in many European countries. Yet its actual origin is somewhat obscure. According to some accounts, Jewish groups lobbied President Truman into casually inserting it into one of his speeches, and thereafter it has endlessly echoed in the media down to the present day. Some angry Internet activist has put together a graphic displaying extracts from dozens of *New York Times* stories between 1869 and 1941 all citing the figure of 6 million Eastern European Jews as being threatened with death, suggesting that our official Holocaust body-count actually predated World War II by as much as three generations. I really wouldn't be surprised if that might be the original source of the number.

Sometimes the creation of a new Holocaust hoax was only narrowly averted. Throughout most of the twentieth century, Jews and blacks had been close political allies in America, with the top leadership of the NAACP almost invariably being Jewish, as were nearly all of Martin Luther King, Jr.'s top white advisors and a very large fraction of the key white activists involved in the black Civil Rights movement of the 1950s and 1960s. But by the late 1960s, a schism had erupted,

with many younger black activists becoming deeply hostile to what they perceived as overwhelming Jewish influence, while more militant blacks, whether Muslim or otherwise, began siding with the Palestinians against Zionist Israel. This growing conflict became especially bitter during Jesse Jackson's presidential campaign of 1988 and reached a flash-point in the New York City of the early 1990s.

A couple of film-makers sought to help heal this rift by producing a major 1992 PBS documentary entitled *The Liberators*, recounting how black American troops had been among the first units that captured the Buchenwald and Dachau concentration camps, thereby freeing the tens of thousands of Jewish inmates from Nazi captivity. A historical narrative of such deep symbolic resonance quickly attracted overwhelming support from both black leaders and Jewish ones, with Jesse Jackson sharing the stage with Holocaust survivors and numerous Jewish luminaries at the Harlem premiere, and the film received an Oscar nomination. However, in early Febuary 1993 Jeffrey Goldberg took to the pages of *The New Republic* to reveal that the story was merely a hoax, based on falsified history. Although the film's Jewish co-producer angrily denounced her critics as racists and Holocaust Deniers, those charges stuck, and were eventually reported in the *New York Times* and other major media outlets. The leading Jewish organizations and Holocaust centers that had been heavily promoting the film soon distanced themselves, and in 2013 *The Times of Israel* even marked the twenty-year anniversary of what it described as a notorious hoax. But I suspect that if matters had gone a little differently, the story might soon have become so deeply embedded in the canonical Holocaust narrative that anyone questioning the facts would have been vilified as a racist.

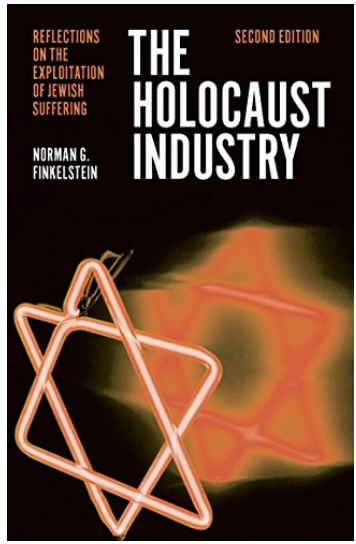
A few years earlier, *The New Republic* had actually been in the forefront of promoting a different hoax also relating to Jewish issues, one with potentially enormous international political significance. In 1984 Joan Peters, an obscure Jewish writer, published a major historical work claiming that her extensive archival research revealed that the bulk of the present-day Palestinians were actually not native to Palestine, but instead were recently-arrived immigrants, drawn there by the heavy economic development produced by the Zionist settlers who had actually preceded them.

Her shocking findings received hundreds of glowing reviews and academic endorsements across the entire spectrum of the mainstream and elite American media, and her book quickly became a huge

bestseller. Leading Jewish Holocaust luminaries such as Dawidowicz and Wiesel took center stage in praising her remarkable scholarship, which seemed likely to completely demolish the claims of the expelled Palestinians, thereby reshaping the nature of the Middle East conflict to Israel's great advantage.

However, a young graduate student in History at Princeton named Norman Finkelstein had considerable interest in the history of Zionism, and being very much surprised by her findings, decided to investigate those claims. Once he began carefully checking her footnotes and her alleged sources, he discovered they were entirely fraudulent, and her groundbreaking research merely amounted to a hoax, which some later suggested had been concocted by an intelligence organization and merely published under her name.

Although Finkelstein widely distributed his important findings, they were totally ignored by all the American journalists, scholars, and media organizations he contacted, with the sole exception of Noam Chomsky, and the growing Joan Peters Hoax might have destroyed the legal basis of the international Palestinian claims to their own Palestine homeland. But some independent-minded British publications eventually picked up his information, and the resulting wave of media embarrassment caused the Peters claims to fade into oblivion. Meanwhile, Finkelstein himself suffered severe retaliation as a consequence, and according to Chomsky was completely blacklisted by his Princeton department and the wider academic community.



More than a dozen years later, Finkelstein's work became the focus of a second major controversy. In the late 1990s, international Jewish organizations launched a major effort to extract many billions of dollars from the largest Swiss banks, arguing that such funds were the rightful property of European Jews who had died in the Holocaust. When the banks initially resisted, arguing that no solid evidence was being presented for such enormous claims, they were harshly denounced by America's Jewish-dominated media, and Jewish lobbying led the American government to threaten them with severe financial sanctions that could have destroyed their businesses. Faced with such serious extortionate pressure, the banks finally gave way and paid out the bulk of the funds being demanded, with those billions mostly retained by the Jewish organizations leading the campaign and spent on their own projects since the purported Jewish heirs were impossible to locate.

This situation led historian Finkelstein to publish a short book in 2000 entitled *The Holocaust Industry*, in which he harshly critiqued what he characterized as a global Jewish money-making enterprise aimed at unfairly extracting wealth on behalf of the supposed Holocaust victims, often with little regard for truth or fairness. Although almost entirely ignored by the American media, it became a major bestseller in Europe, which eventually forced American publications to give it some attention. Among other things, Finkelstein noted that more than a half-century after the end of the Holocaust, the number of officially designated Holocaust survivors had grown so large that simple mortality considerations seemed to imply that huge numbers of European Jews must have survived the war. This obviously raised

serious questions about how many might have actually died during that conflict and its accompanying Holocaust.

Over the years, I had noticed the same sorts of media reports claiming enormous totals of Holocaust survivors still alive now six or seven decades after the event. For example, even as late as 2009 an official at Israel's Jewish Agency justified laws criminalizing Holocaust Denial by explaining that almost 65 years after the end of the war "there are still hundreds of thousands of living Holocaust survivors," a statement which itself seemed to constitute rather explicit Holocaust Denial. Indeed, a very noticeable number of all the *New York Times* obituaries I read these days in my morning newspaper seem to include Holocaust survivors still expiring in their eighties and nineties.

Anyone who reads serious history books knows that Jews have generally enjoyed a reputation for producing many of the world's greatest swindlers and frauds, hardly surprising given their notorious tendency to lie and dissemble. Meanwhile, the Jewish community also seems to contain far more than its fair share of the emotionally disturbed and the mentally ill, and perhaps as a consequence has served as a launching-pad for many of the world's religious cults and fanatic ideological movements. Any exploration of the Holocaust certainly tends to support this rather negative appraisal.

## The Holocaust and Hollywood

Although the Holocaust began to enter American consciousness during the 1960s and 1970s with the publication of major books by Hilberg, Levin, Dawidowicz, and others, together with the resulting articles and reviews that these generated, the initial social impact was probably not substantial, at least outside the Jewish community. Even highly successful books selling in the many tens of thousands of copies would have had little impact in a population of more than 200 million.

Our media completely shapes our perceived reality of the world, and although intellectuals and many of the highly educated are greatly influenced by books and other forms of printed content, the vast majority of the population understands the world through electronic media, especially that of popular entertainment.

Consider, for example, the 1974 publication of *Time on the Cross: The Economics of American Negro Slavery*, a magisterial two volume analysis by economists Robert William Fogel and Stanley L. Engerman.

By applying quantitative methods, the study overturned generations of assumptions about that American social institution, demonstrating that black slaves in the South were encouraged to marry and maintain their households, while having diets and medical care comparable to that of the free white population and often superior to that of Northern industrial wage-earners. Moreover, following emancipation the life expectancy of freedmen declined by ten percent and their illnesses increased by twenty per cent. All of this is summarized in the extensive Wikipedia entry.

Although their results were controversial, the authors had the strongest possible academic credentials, with Fogel, an eminent scholar, being a leading figure in a school of economics who went on to win a Nobel Prize. And Fogel's ideological credentials were even more robust, given that he had had a lifelong commitment to black Civil Rights starting with the eight years he had spent as a young Communist Party organizer, while his 1949 marriage to a black woman had often subjected the couple to the indignities of the anti-miscegenation laws of that era. Consequently, their findings received unprecedented coverage in the mainstream media for an academic study and surely influenced numerous historians and journalists. Yet I think the long-term impact upon popular perceptions about slavery has been almost nil.

By contrast, in 1976 the *ABC* television network ran the prime-time miniseries *Roots*, a multi-generational account of a slave family. The story closely adhered to the traditionally harsh slavery narrative, while supposedly being based upon the recorded family history of Alex Haley, the author of the best-selling book of that same title. But although his work was later found to be fraudulent and apparently plagiarized, the ratings were stellar and the social impact enormous due to the audience of 100 million Americans who watched those episodes. Thus, even the most impressive written scholarship had absolutely no chance of competing with fictionalized television drama.

All three of America's television networks were under Jewish ownership or control, so it was hardly surprising that two years later *ABC* decided to repeat this process with the 1978 television miniseries *Holocaust*, which also achieved an audience of 100 million and generated enormous profits. It seems quite possible this may have been the first time many American families discovered that colossal but almost entirely invisible event of World War II.

The following year, William Styron published *Sophie's Choice*, a heart-rending tale involving deeply buried memories of the extermination of

Christian Polish children in the Auschwitz gas chambers. Although such an occurrence was absolutely contrary to the doctrines of all Jewish Holocaust scholars, the novel became a huge national best-seller anyway, and a 1982 film of the same name soon followed, with Meryl Streep winning an Oscar for Best Actress. A decade later, Steven Spielberg's 1993 *Schindler's List* won a remarkable seven Oscars, while grossing nearly $100 million.

With Hollywood so overwhelmingly Jewish, the consequences were hardly surprising, and a huge cinematic genre soon developed. According to Finkelstein, Hollywood produced some 180 Holocaust films just during the years 1989-2004. Even the very partial subset of Holocaust films listed on Wikipedia has grown enormously long, but fortunately the Movie Database has winnowed down the catalog by providing a list of the 50 Most Moving Holocaust Films.

Many billions of dollars have surely been invested over the years on the total production costs of this ongoing business enterprise. For most ordinary people, "seeing is believing," and how could anyone seriously doubt the reality of the Holocaust after having seen all the gas chambers and mounds of murdered Jewish corpses constructed by highly-paid Hollywood set designers? Doubting the existence of Spiderman and the Incredible Hulk would be almost as absurd.

Some 2% of Americans have a Jewish background, while perhaps 95% possess Christian roots, but the Wikipedia list of Christian films seems rather scanty and rudimentary by comparison. Very few of those films were ever widely released, and the selection is stretched to even include *The Chronicles of Narnia*, which contains no mention of Christianity whatsoever. One of the very few prominent exceptions on the list is Mel Gibson's 2004 *The Passion of the Christ,* which he was forced to personally self-fund. And despite the enormous financial success of that movie, one of the most highly profitable domestic releases of all time, the project rendered Gibson a hugely vilified pariah in the industry over which he had once reigned as its biggest star, especially after word got around that his own father was a Holocaust Denier.

In many respects, Hollywood and the broader entertainment media today provide the unifying spiritual basis of our deeply secular society, and the overwhelming predominance of Holocaust-themed films over Christian ones has obvious implications. Meanwhile, in our globalized world, the American entertainment-media complex totally

dominates Europe and the rest of the West, so that the ideas generated here effectively shape the minds of many hundreds of millions of people living elsewhere, whether or not they fully recognize that fact.

In 2009, Pope Benedict XVI sought to heal the long-standing Vatican II rift within the Catholic Church and reconcile with the breakaway Society of St. Pius X faction. But this became a major media controversy when it was discovered that Bishop Richard Williamson, one of the leading members of that latter organization, had long been a Holocaust Denier and also believed that Jews should convert to Christianity. Although the many other differences in Catholic doctrinal faith were fully negotiable, apparently refusing to accept the reality of the Holocaust was not, and Williamson remained estranged from the Catholic Church. Soon afterward he was even prosecuted for heresy by the German government.

Internet critics have suggested that over the last couple of generations, energetic Jewish activists have successfully lobbied Western nations into replacing their traditional religion of Christianity with the new religion of Holocaustianity, and the Williamson Affair certainly seems to support that conclusion.

Consider the French satirical magazine *Charlie Hebdo*. Funded by Jewish interests, it spent years launching vicious attacks against Christianity, sometimes in crudely pornographic fashion, and also periodically vilified Islam. Such activities were hailed by French politicians as proof of the total freedom of thought allowed in the land of Voltaire. But the moment that one of its leading cartoonists made a very mild joke related to Jews, he was immediately fired, and if the

publication had ever ridiculed the Holocaust, it surely would have been immediately shut down, and its entire staff possibly thrown into prison.

Western journalists and human rights advocates have often expressed support for the boldly transgressive activities of the Jewish-funded Femen activists when they desecrate Christian churches all around the world. But such pundits would certainly be in an uproar if anyone were to act in similar fashion toward the growing international network of Holocaust Museums, most of them built at public expense.

Indeed, one of the underlying sources of bitter Western conflict with Vladimir Putin's Russia seems to be that he has restored Christianity to a favored place in a society where the early Bolsheviks had once dynamited churches and massacred many thousands of priests. Western intellectual elites held far more positive feelings toward the USSR while its leaders retained a stridently anti-Christian attitude.

## The Rise and Suppression of Holocaust Denial

Since the Holocaust had been almost unknown in America until the mid-1960s, explicit Holocaust Denial was equally non-existent, but as the former grew in visibility following the publication of Hilberg's 1961 book, the latter soon began to awaken as well.

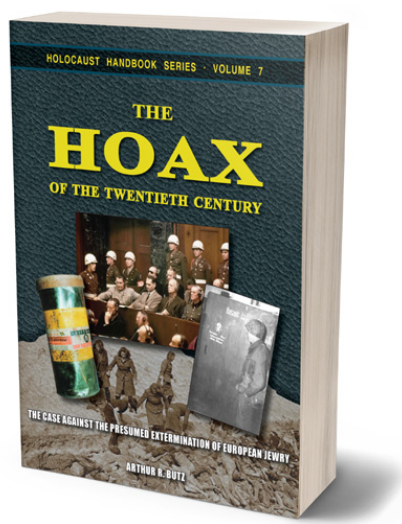
Lipstadt's vilification of Barnes as the "godfather" of Holocaust Denial does contain a nugget of truth. His posthumously-published 1968 review endorsing Rassinier's denialist analysis seems to be the first such substantial statement published anywhere in America, at least if we exclude Beaty's very casual 1951 dismissal of the Jewish claims, which seems to have attracted negligible public attention.

Near the end of the 1960s, a right-wing publisher named Willis Carto came across a short and unpolished Holocaust Denial manuscript, apparently produced some years earlier, and then ignored legal niceties by simply putting it into print. The purported author soon sued for plagiarism, and although the case was eventually settled, his identity eventually leaked out as being that of David L. Hoggan, a Barnes protege with a Harvard Ph.D. in history, serving as a junior faculty member at Stanford. His desire for anonymity was aimed at preventing the destruction of his career, but he failed in that effort, and further academic appointments quickly dried up.

Meanwhile, Murray Rothbard, the founding father of modern libertarianism, had always been a strong supporter of historical

Revisionism, and greatly admired Barnes, who for decades had been the leading figure in that field. Barnes had also briefly hinted at his general skepticism about the Holocaust in a lengthy 1967 article appearing in the *Rampart Journal*, a short-lived libertarian publication, and this may have been noticed within those ideological circles. It appears that by the early 1970s, Holocaust Denial had become a topic of some discussion within America's heavily Jewish but fiercely free-thinking libertarian community, and this was to have an important consequence.

A professor of Electrical Engineering at Northwestern named Arthur R. Butz was casually visiting some libertarian gathering during this period when he happened to notice a pamphlet denouncing the Holocaust as a fraud. He had never previously given any thought to the issue, but such a shocking claim captured his attention, and he began looking into the matter early in 1972. He soon decided that the accusation was probably correct, but found the supporting evidence, including that presented in the unfinished and anonymous Hoggan book, far too sketchy, and decided it needed to be fleshed out in much more detailed and comprehensive fashion. He proceeded to undertake this project over the next few years, working with the methodical diligence of a trained academic engineer.



HOLOCAUST HANDBOOK SERIES · VOLUME 7
THE
HOAX
OF THE TWENTIETH CENTURY
THE CASE AGAINST THE PRESUMED EXTERMINATION OF EUROPEAN JEWRY
ARTHUR R. BUTZ

His major work, *The Hoax of the Twentieth Century*, first appeared in print late in 1976, and immediately became the central text of the Holocaust Denial community, a position it still seems to retain down to this present day, while with all the updates and appendices, the length has grown to well over 200,000 words. Although no mention of this forthcoming book appeared in the February 1976 issue of *Reason*,

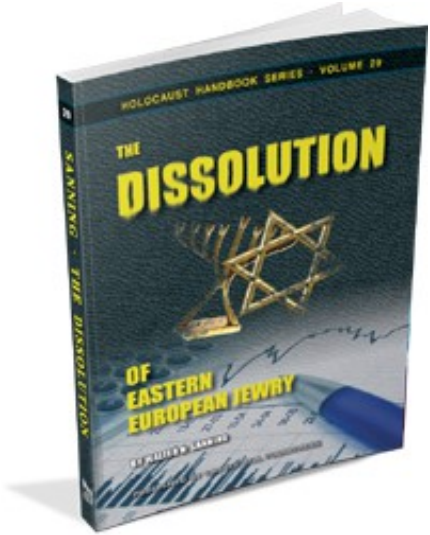
it is possible that word of the pending publication had gotten around within libertarian circles, prompting the sudden new focus upon historical Revisionism.

Butz was a respectable tenured professor at Northwestern, and the release of his book laying out the Holocaust Denial case soon became a minor sensation, covered by the *New York Times* and other media outlets in January 1977. In one of her books, Lipstadt devotes a full chapter entitled “Entering the Mainstream” to Butz’s work. According to a December 1980 *Commentary* article by Dawidowicz, Jewish donors and Jewish activists quickly mobilized, attempting to have Butz fired for his heretical views, but back then academic tenure still held firm and Butz survived, an outcome that seems to have greatly irritated Dawidowicz.

Such a detailed and comprehensive book laying out the Holocaust Denial case naturally had a considerable impact on the national debate, especially since the author was a mainstream and apparently apolitical academic, and an American edition of Butz’s book soon appeared in 1977. I’m very pleased to have made arrangements to include the volume in my collection of Controversial HTML Books, so those interested can easily read it and decide for themselves.

- The Hoax of the Twentieth Century
  *The Case Against the Presumed Extermination of European Jewry*
  Arthur R. Butz • 1976/2015 • 225,000 Words

The following year, these Holocaust Denial trends seemed to gain further momentum as Carto opened a small new publishing enterprise in California called the Institute for Historical Review (IHR), which launched a quarterly periodical entitled *The Journal of Historical Review* in 1980. Both the IHR and its *JHR* publication centered their efforts around Revisionism in general, but with Holocaust Denial being their major focus. Lipstadt devotes an entire chapter to the IHR, later noting that most of the main authors of the February 1976 *Reason* issue soon became affiliated with that project or with other Carto enterprises, as did Butz, while the editorial board of the *JHR* was soon well-stocked with numerous Ph.D.’s, often earned at highly-reputable universities. For the next quarter century or so, the IHR would hold small conferences every year or two, with David Irving eventually becoming a regular presenter, and even fully mainstream figures such as Pulitzer Prize-winning historian John Toland occasionally appearing as speakers.



As an important example of IHR efforts, in 1983 the organization published *The Dissolution of Eastern Europe Jewry*, a very detailed quantitative analysis of the underlying demographics and population movements around the period encompassed by World War II, apparently the first such study undertaken. The author, writing under the pen-name Walter N. Sanning, sought to revise the extremely simplistic population analysis casually assumed by Holocaust historians.

Before the war, millions of Jews had lived in Eastern Europe, and after the war, those communities had mostly vanished. This undeniable fact has long stood as an implicit central pillar of the traditional Holocaust narrative. But drawing upon entirely mainstream sources, Sanning persuasively demonstrates that the situation was actually far more complicated than it might seem. For example, it was widely reported at the time that vast numbers of Polish Jews had been transported by the Soviets to locations deep within their territory, on both voluntary and involuntary terms, with future Israeli Prime Minister Menachem Begin being including in those transfers. In addition, huge numbers of heavily urbanized Soviet Jews were similarly evacuated ahead of the advancing German forces in 1941. The exact size of these population movements has long been uncertain and disputed, but Sanning's careful analysis of postwar Soviet census data and other sources suggests that the totals were likely towards the upper end of most estimates. Sanning makes no claim that his findings are definitive, but even if they are only partially correct, such results would certainly preclude the reality of traditional Holocaust numbers.

Another regular IHR participant was Robert Faurisson. As a professor

of literature at the University of Lyons-2, he began expressing his public skepticism about the Holocaust during the 1970s, and the resulting media uproar led to efforts to remove him from his position, while a petition was signed on his behalf by 200 international scholars, including famed MIT professor Noam Chomsky. Faurisson stuck to his opinions, but attacks persisted, including a brutal beating by Jewish militants that hospitalized him, while a French political candidate espousing similar views was assassinated. Jewish activist organizations began lobbying for laws to broadly outlaw the activities of Faurisson and others, and in 1990, soon after the Berlin Wall fell and research at Auschwitz and other Holocaust sites suddenly became far easier, France passed a statute criminalizing Holocaust Denial, apparently the first nation after defeated Germany to do so. During the years that followed, large numbers of other Western countries did the same, setting the disturbing precedent of resolving scholarly disputes via prison sentences, a softer form of the same policy followed in Stalinist Russia.

Since Faurisson was a literary scholar, it is not entirely surprising that one of his major interests was *The Diary of Anne Frank*, generally regarded as the Holocaust's iconic literary classic, telling the story of a young Jewish girl who died after being deported from Holland to Auschwitz. He argued that the text was substantially fraudulent, written by someone else after the end of the war, and for decades various determined individuals have argued the case back and forth. I cannot properly evaluate any of their complex arguments, which apparently involve questions of ballpoint pen technology and textual emendations, nor have I ever read the book itself.

But for me, the most striking aspect of the story is the girl's actual fate under the official narrative, as recounted in the thoroughly establishmentarian Wikipedia entry. Apparently disease was raging in her camp despite the best efforts of the Germans to control it, and she soon became quite ill, mostly remaining bedridden in the infirmary, before eventually dying from typhus in Spring 1945 at a different camp about six months after her initial arrival. It seems rather odd to me that a young Jewish girl who fell severely ill at Auschwitz would have spent so much time in camp hospitals and eventually died there, given that we are told the primary purpose of Auschwitz and other such camps was the efficient extermination of its Jewish inmates.

By the mid-1990s the Holocaust Denial movement seemed to be gaining in public visibility, presumably aided by the doubts raised

after the official 1992 announcement that the estimated deaths at Auschwitz had been reduced by around 3 million.

For example, the February 1995 issue of *Marco Polo*, a glossy Japanese magazine with a circulation of 250,000, carried a long article declaring that the gas chambers of the Holocaust were a propaganda hoax. Israel and Jewish-activist groups quickly responded, organizing a widespread advertising boycott of all the publications of the parent company, one of Japan's most respected publishers, which quickly folded in the face of that serious threat. All copies of the issue were recalled from the newspapers, the staffers were dismissed, and the entire magazine was soon shut down, while the president of the parent company was forced to resign.

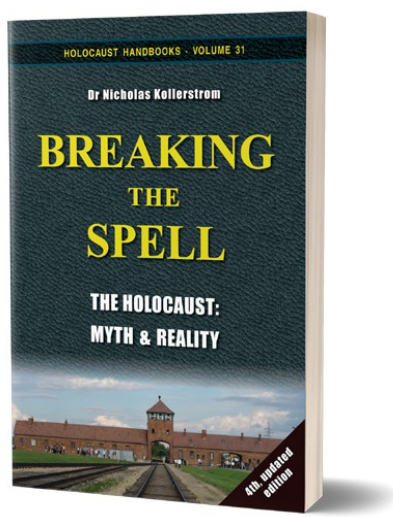
In exploring the history of Holocaust Denial, I have noticed this same sort of recurrent pattern, most typically involving individuals rather than institutions. Someone highly-regarded and fully mainstream decides to investigate the controversial topic, and soon comes to conclusions that sharply deviate from the official narrative of the last two generations. For various reasons, those views become public, and he is immediately demonized by the Jewish-dominated media as a horrible extremist, perhaps mentally-deranged, while being relentlessly hounded by a ravenous pack of fanatic Jewish-activists. This usually brings about the destruction of his career.

In the early 1960s Stanford historian David Hoggan produced his anonymous manuscript *The Myth of the Six Million*, but once it got into circulation and his identity became known, his academic career was destroyed. A dozen years later, something along the same lines happened with Northwestern Electrical Engineering professor Arthur Butz, and only his academic tenure saved him from a similar fate.

Fred Leuchter was widely regarded as one of America's leading expert specialists on the technology of executions, and a long article in *The Atlantic* treated him as such. During the 1980s, Ernst Zundel, a prominent Canadian Holocaust Denier, was facing trial for his disbelief in the Auschwitz gas chambers, and one of his expert witnesses was an American prison warden with some experience in such systems, who recommended involving Leuchter, one of the foremost figures in the field. Leuchter soon took a trip to Poland and closely inspected the purported Auschwitz gas chambers, then published the *Leuchter Report*, concluding that they were obviously a fraud and could not possibly have worked in the manner Holocaust scholars had always claimed. The ferocious attacks which followed soon cost him his entire business career and destroyed his marriage.

David Irving had ranked as the world's most successful World War II historian, with his books selling in the millions amid glowing coverage in the top British newspapers when he agreed to appear as an expert witness at the Zundel trial. He had always previously accepted the conventional Holocaust narrative, but reading the *Leuchter Report* changed his mind, and he concluded that the Auschwitz gas chambers were just a myth. He was quickly subjected to unrelenting media attacks, which first severely damaged and then ultimately destroyed his very illustrious publishing career, and he later even served time in an Austrian prison for his unacceptable views.

Dr. Germar Rudolf was a successful young German chemist working at the prestigious Max Planck Institute when he heard of the controversy regarding the *Leuchter Report,* which he found reasonably persuasive but containing some weaknesses. Therefore, he repeated the analysis on a more thorough basis, and published the results as the *Chemistry of Auschwitz*, which came to the same conclusions as Leuchter. And just like Leuchter before him, Rudolf suffered the destruction of his career and his marriage, and since Germany treats these matters in harsher fashion, he eventually served five years in prison for his scientific impudence.



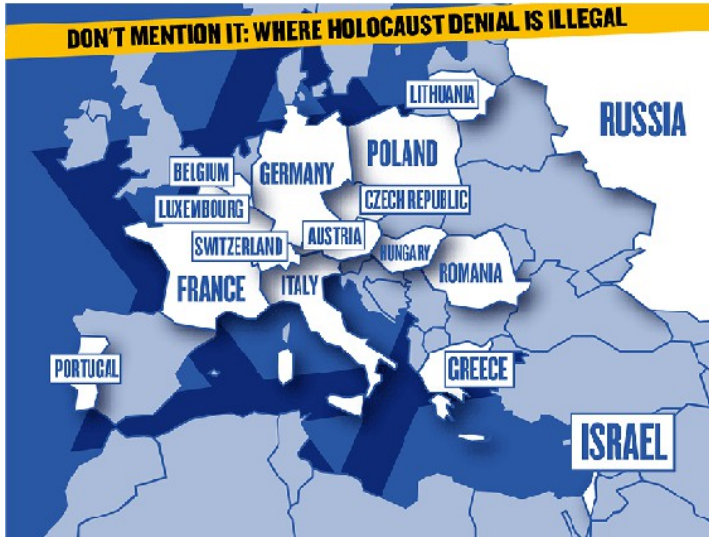
Most recently, Dr. Nicholas Kollerstrom, who had spent eleven years as a historian of science on the staff of University College, London, suffered this same fate in 2008. His scientific interests in the Holocaust provoked a media firestorm of vilification, and he was fired with a single day's notice, becoming the first member of his research institution ever expelled for ideological reasons. He had previously

provided the Isaac Newton entry for a massive biographical encyclopedia of astronomers, and America's most prestigious science journal demanded that the entire work be pulped, destroying the work of over 100 writers, because it had been fatally tainted by having such a villainous contributor. He recounted this unfortunate personal history as an introduction to his 2014 book *Breaking the Spell*, which I highly recommend.

Kollerstrom's text effectively summarizes much of the more recent Holocaust Denial evidence, including the official Auschwitz death books returned by Gorbachev after the end of the Cold War, which indicate that Jewish fatalities were some 99% lower than the widely-believed total. Furthermore, Jewish deaths actually showed a sharp decline once plentiful supplies of Zyklon B arrived, exactly contrary to what might have been expected under the conventional account. He also discusses the interesting new evidence contained in the British wartime decrypts of all German communications between the various concentration camps and the Berlin headquarters. Much of this material is presented in an interesting two hour interview on *Red Ice Radio*, conveniently available on YouTube:

The lives and careers of a very sizable number of other individuals have followed this same unfortunate sequence, which in much of Europe often ends in criminal prosecution and imprisonment. Most notably, a German lawyer who became a bit too bold in her legal arguments soon joined her client behind bars, and as a consequence, it has become increasingly difficult for accused Holocaust Deniers to secure effective legal representation. By Kollerstrom's estimates, many thousands of individuals are currently serving time across Europe for

Holocaust Denial.



My impression is that by the late 1960s, the old Soviet Bloc countries had mostly stopped imprisoning people merely for questioning Marxist-Leninist dogma, and reserved their political prisons only for those actively organizing against the regime, while Holocaust Denial is treated today in far harsher fashion. One clear difference is that actual belief in Communist doctrine had entirely faded away to almost nothing even among the Communist leadership itself, while these days Holocaustianity is still a young and deeply held faith, at least within a small slice of the population that exerts enormously disproportionate leverage over our public institutions.

Another obvious factor is the many billions of dollars currently at stake in what Finkelstein has aptly characterized as "the Holocaust Industry." For example, potentially enormous new claims are now being reopened against Poland for Jewish property that was lost or confiscated during the World War II era.

In America, the situation is somewhat different, and our First Amendment still protects Holocaust Deniers against imprisonment, though the efforts of the ADL and various other groups to criminalize "hate speech" are clearly aimed at eventually removing that obstacle. But in the meantime, crippling social and economic sanctions are often used to pursue the same objectives.

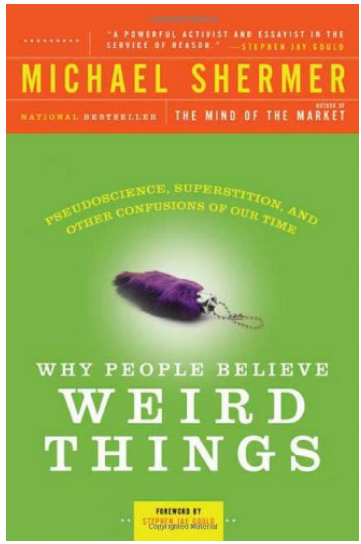
Furthermore, various Internet monopolies have been gradually persuaded or co-opted into preventing the easy distribution of dissenting information. There have been stories in the media over the

last few years that Google has been censoring or redirecting its Holocaust search results away from those disputing the official narrative. Even more ominously, Amazon, our current near-monopolistic retailer of books, last year took the unprecedented step of banning thousands of Holocaust Denial works, presumably lest they "confuse" curious readers, so it is fortunate that I had purchased mine a couple of years earlier. These parallels with George Orwell's *1984* are really quite striking, and the "Iron Curtain Over America" that Beaty had warned about in his 1951 book of that title seems much closer to becoming a full reality.

Various figures in the Holocaust Denial community have attempted to mitigate this informational blacklist, and Dr. Rudolf some time ago established a website HolocaustHandbooks.com, which allows a large number of the key volumes to be purchased or easily read on-line in a variety of different formats. But the growing censorship by Amazon, Google, and other Internet monopolies greatly reduces the likelihood that anyone will readily encounter the information.

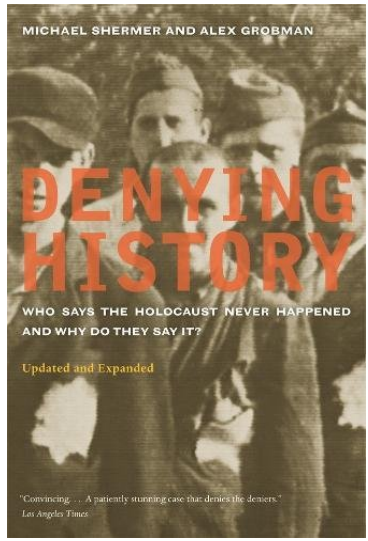
Obviously, most supporters of the conventional Holocaust narrative would prefer to win their battles on the level playing fields of analysis rather than by utilizing economic or administrative means to incapacitate their opponents. But I have seen little evidence that they have enjoyed any serious success in this regard.

Aside from the various books by Lipstadt, which I found to be of poor quality and quite unpersuasive, one of the most energetic Holocaust supporters of the last couple of decades seems to have been Michael Shermer, the editor of *Skeptic* magazine, who had earned his degrees in psychology and the history of science.



"A POWERFUL ACTIVIST AND ESSAYIST IN THE SERVICE OF REASON." —STEPHEN JAY GOULD
MICHAEL SHERMER
NATIONAL BESTSELLER
AUTHOR OF THE MIND OF THE MARKET
PSEUDOSCIENCE, SUPERSTITION, AND OTHER CONFUSIONS OF OUR TIME
WHY PEOPLE BELIEVE
WEIRD THINGS
FOREWORD BY

In 1997, he published *Why People Believe Weird Things*, seeking to debunk all sorts of irrational beliefs popular in certain circles, with the book's subtitle describing these as "pseudo-science" and "superstition." His cover text focused on ESP, alien abductions, and witchcraft, but rebutting Holocaust Denial was the single largest portion of that book, encompassing three full chapters. His discussion of this latter subject was rather superficial, and he probably undercut his credibility by grouping it together with his debunking of the scientific reality of "race" as a similar right-wing fallacy, one also long since disproved by mainstream scientists. Regarding the latter issue, he went on to argue that the alleged black-white differences claimed in works such as *The Bell Curve* by Richard Herrnstein and Charles Murray was entirely pseudo-scientific nonsense, and he emphasized that book and similar ones had been promoted by the same pro-Nazi groups who advocated Holocaust Denial, with those two pernicious doctrines being closely linked together. Shermer had recruited Harvard professor Stephen Jay Gould to write the Foreword for his book and that raises serious questions about his knowledge or his judgment since Gould is widely regarded as one of the most notorious scientific frauds of the late twentieth century.



MICHAEL SHERMER AND ALEX GROBMAN
DENYING HISTORY
WHO SAYS THE HOLOCAUST NEVER HAPPENED AND WHY DO THEY SAY IT?
Updated and Expanded
"Convincing . . . A patiently stunning case that denies the deniers."
Los Angeles Times

In 2000, Shermer returned to the battle, publishing *Denying History*, entirely focused on refuting Holocaust Denial. This time he recruited Holocaust scholar Alex Grobman as his co-author and acknowledged the generous financial support he had received from various Jewish organizations. A large portion of the text seemed to focus on the psychology and sociology of Holocaust Deniers, trying to explain why people could believe in such patently absurd nonsense. Indeed, so much space was devoted to those issues that he was forced to entirely skip over the official reduction of the Auschwitz body-count by 3 million just a few years earlier, thus avoiding any need to explain why this large shift had had no impact on the canonical Holocaust figure of Six Million.

Although various writers such as Shermer may have been encouraged by generous financial subsidies to make fools of themselves, their more violent allies on the extreme fringe have probably had a greater impact on the Holocaust debate. Although judicial and economic sanctions may deter the vast majority of Holocaust Deniers from showing their face, extra-legal violence has also often been deployed against those hardy souls who remain stubbornly unbowed.

For example, during the 1980s the offices and warehouse storage facilities of the IHR in Southern California were fire-bombed and totally destroyed by Jewish militants. And although Canada has traditionally had little political violence, in 1995 the large, ramshackle house that served as the residence and business office of Canada's Ernst Zundel, one of the world's leading publishers and

distributers of Holocaust Denial literature, was similarly fire-bombed and burned to the ground. Zundel had already faced several criminal prosecutions on charges of spreading "false news," and eventually served years in prison, before being deported back to his native Germany, where he served additional imprisonment. Various other prominent Holocaust Deniers have even faced threats of assassination.

Most historians and other academic scholars are quiet souls, and surely the looming threat of such serious terroristic violence must have dissuaded many of them from involving themselves in such obviously controversial issues. Meanwhile, relentless financial and social pressure may gradually wear down both individuals and organizations, causing them to eventually either abandon the field or become far less active, with their places sometimes taken by newcomers.

The year after the 9/11 attacks, the *JHR* ceased print publication. The growth of the Internet was probably an important contributing factor, and with the national focus shifting so sharply toward foreign policy and the Middle East, its IHR parent organization became much less active, while much of the ongoing debate in Revisionism and Holocaust Denial shifted to various other online venues. But at some point over the years, the *JHR* digitized many hundreds of its articles and posted them on its website, providing over three million words of generally very high-quality historical content.

Over the last couple of months, I have been repeatedly surprised to discover that the historians associated with the IHR had long ago published articles on topics quite parallel to some of my own. For example, after I published an article on the Suvorov Hypothesis that Germany's Barbarossa attack had preempted Stalin's planned attack and conquest of Europe, someone informed me that a reviewer had extensively discussed the same Suvorov book twenty years earlier in an issue of *JHR*. I also discovered several pieces by CIA defector Victor Marchetti, a important figure for JFK assassination researchers, who had received little attention in the mainstream media. There were also articles on the fate of the Israeli attack on the *USS Liberty*, a topic almost entirely excluded from the mainstream media.

Casually browsing some of the archives, I was quite impressed with their quality, and since the archives were freely available for anyone to republish, I went ahead and incorporated them, making the millions of words of their Revisionist and Holocaust Denial content much more conveniently available to interested readers. The material is fully searchable, and also organized by Author, Topic, and Time

Period, with a few sample links included below:

The Journal of Historical Review, 1980-2002 Issues

**Author Archives:**

- David Irving – 11 Articles
- Arthur R. Butz – 15 Articles
- Robert Faurisson – 47 Articles
- James J. Martin – 13 Articles
- Percy L. Greaves, Jr. – 8 Articles

**Topic Archives:**

- Holocaust – 306 Articles
- World War II – 201 Articles
- Pearl Harbor – 15 Articles
- USS Liberty – 3 Articles

So for those particularly interested in Holocaust Denial, well over a million words of such discussion may now be conveniently available, including works by many of the authors once so highly regarded by the early editors of *Reason* magazine.

## Secretive Holocaust Denial

The steadily growing economic and political power of organized Jewish groups, backed by Hollywood image-making, eventually won the visible war and crushed the Holocaust Denial movement in the public arena, enforcing a particular historical narrative by criminal prosecutions across most of Europe and severe social and economic sanctions in America. But a stubborn underground resistance still exists, with its size being difficult to estimate.

Although my interest in the Holocaust had always been rather minimal, once the Internet came into being and my circle of friends and acquaintances greatly expanded, the topic would very occasionally come up. Over the years, a considerable number of seemingly rational people at one time or another privately let slip their extreme skepticism about various elements of the canonical Holocaust narrative, and such doubts seemed to represent merely the tip of the iceberg.

Every now and then someone in that category spoke a little too freely or became a target for retaliation on a different matter, and our media went into a feeding frenzy of Holocaust Denial accusations and counter-accusations.

For example, during the impeachment battles of the late 1990s, Clinton partisans believed that prominent liberal pundit Christopher Hitchens had betrayed the personal confidences of presidential aide Sidney Blumenthal, and journalist Edward Jay Epstein decided to retaliate in kind, widely circulating a memo to the media accusing Hitchens of secretly being a Holocaust Denier. He alleged that at a 1995 dinner gathering following a *New Yorker* anniversary celebration, Hitchens had drunk a little too much wine and began expounding to his table-mates that the Holocaust was simply a hoax. Epstein backed his claim by saying he had been so shocked at such statements that he had entered them into his personal diary. That telling detail and the fact that most of the other witnesses seemed suspiciously vague in their recollections persuaded me that Epstein was probably being truthful. A bitter feud between Hitchens and Epstein soon erupted.

In 2005 Hitchens denounced various opponents of Bush's Iraq War as anti-Semites, and in retaliation Alexander Cockburn published a couple of *Counterpunch* columns resurrecting that 1999 controversy, which is when I first discovered it. As a regular reader of *Counterpunch*, I was intrigued and Googling around a bit, quickly located media accounts of Epstein's explicit accusations. Numerous reports of the the incident still survive on the web, including one from the *NY Daily News* as well as a portion of an *MSNBC* piece, and although some of the more extensive ones have disappeared over the last dozen years, the media text I remember reading in 2005 has been preserved on the static HTML pages of several websites:

> Epstein told MSNBC that Hitchens had misspoken himself on the Holocaust on Feb. 12, 1995 – in fact, practically four years ago – as the two of them, along with some other friends, were dining in New York.
>
> Epstein was so shocked, he says, and considered Hitchens doubts so grave, that he went home and noted them in his diary!
>
> According to the Epstein diary: "Once seated in a booth, and freely sipping his free red wine, Hitchens advanced a theory more revealing than anything going on at the Hudson theater. His thesis, to the shock of everyone at the table, was that the

> Holocaust was a fiction developed by a conspiracy of interests bent on 'criminalizing the German Nation'"
>
> "He explained that no evidence of German mass murder had ever been found – and what gruesome artifacts had been found had been fabricated after the event," Epstein confided to his diary.
>
> "What of the testimony of Nazi generals at Nuremberg about the death camps," he asked.
>
> Hitchens, according to the Epstein diary notation, explained ". . . without missing a beat, that such admissions were obtained under Anglo-American torture." Epstein then asked, as noted in his diary: "'But what happened to the Jews in Europe?' Hitch shrugged and said, 'Many were killed by local villagers when they ran away, others died natural deaths, and the remainder made it to Israel."

After reading these interesting columns, I began noticing that Cockburn himself sometimes provided hints suggesting that his own personal opinion on the Holocaust might be somewhat heretical, including his cryptical remarks that huge hoaxes were actually much easier to create and maintain than most people realized.

Just a few months after his attack on Hitchens, Cockburn published a two-part article strongly arguing that Nobel Peace Prize Winner Elie Wiesel, the most famous of all Holocaust survivors, was simply a fraud. I had always been taught that Zyklon B was the deadly agent used by the Nazis to exterminate the Jews of Auschwitz and I had vaguely become aware that Holocaust Deniers absurdly claimed the compound had instead been employed as a delousing agent in the camps, aimed at preventing the spread of Typhus; but then the following year, I was shocked to discover in one of Cockburn's columns that for decades the U.S. government had itself used Zyklon B as the primary delousing agent for immigrants entering at its Mexican border. I recall several other columns from the mid-2000s dancing around Holocaust issues, but I now seem unable to locate them within the *Counterpunch* archives.

My growing realization 15-odd years ago that substantial numbers of knowledgeable people appeared to be secret adherents of Holocaust Denial certainly reshaped my own unquestioning assumptions on that subject. The occasional newspaper account of a Holocaust Denier

being discovered and then flayed and destroyed by the media easily explained why the public positions on that subject remained so unanimous. Being busy with other things, I don't think I ever had a conversation with anyone on that controversial subject or even so much as an email exchange, but I did keep my eyes and ears open, and huge doubts had certainly entered my mind many years before I ever bothered reading my first book on the subject.

Meanwhile, the concurrent collapse of my belief in our official *American Pravda* narrative on so many other controversial topics played a major role as well. Once I realized to my dismay that I couldn't believe a word of what our media and political leaders said about major events in the here and now, their credibility on controversial happenings so long ago and far away entirely disappeared. For these reasons, I had grown quite suspicious and held a very open mind on Holocaust matters as I eventually began reading books on both sides of the issue in the wake of the *Reason* controversy.

## The Future of Holocaust Denial

For many years following the end of World War II very little seems to have been written about the momentous topic now known as the Holocaust. But from the 1960s onward, interest surged so enormously that many thousands or even tens of thousands of volumes on that once-ignored event have been produced. Therefore, the fifteen or twenty books that I have personally read is merely a sliver of that total.

I have invested only a few weeks of reading and research in studying this large and complex subject, and my knowledge is obviously dwarfed by that of the considerable number of individuals who have devoted many years or decades of their lives to such activity. For these reasons, the analysis I have presented above must surely contain numerous gaping errors that others could easily correct. But sometimes a newcomer may notice things that deeply-involved professionals might normally miss, and may also better understand the perspectives of those who have likewise never paid much attention to the subject.

Any conclusions I have drawn are obviously preliminary ones, and the weight others should attach to these must absolutely reflect my strictly amateur status. However, as an outsider exploring this contentious topic I think it far more likely than not that the standard Holocaust narrative is at least substantially false, and quite possibly,

almost entirely so.

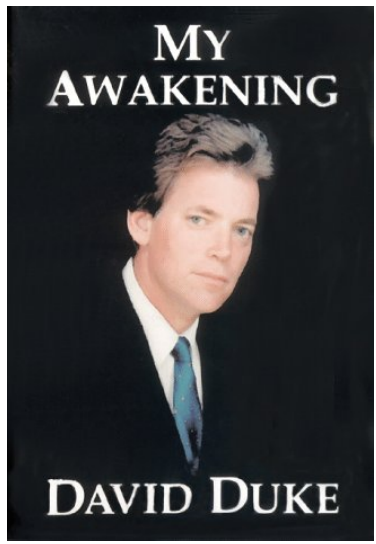
Despite this situation, the powerful media focus in support of the Holocaust over the last few decades has elevated it to a central position in Western culture. I wouldn't be surprised if it currently occupies a larger place in the minds of most ordinary folk than does the Second World War that encompassed it, and therefore possesses greater apparent reality.

However, some forms of shared beliefs may be a mile wide but an inch deep, and the casual assumptions of individuals who have never actually investigated a given subject may rapidly change. Also, the popular strength of doctrines that have long been maintained in place by severe social and economic sanctions, often backed by criminal penalties, may possibly be much weaker than anyone realizes.

Until thirty years ago, Communist rule over the USSR and its Warsaw Pact allies seemed absolutely permanent and unshakeable, but the roots of that belief had totally rotted away, leaving behind nothing more than a hollow facade. Then one day, a gust of wind came along, and the entire gigantic structure collapsed. I wouldn't be surprised if our current Holocaust narrative eventually suffers that same fate, perhaps with unfortunate consequences for those too closely associated with having maintained it.

# 9/11 Conspiracy Theories

September 10, 2018 • 11,000 Words



Back in 1999 I was invited to join Steve Sailer's HBD email group, where I encountered all sorts of interesting people. The participants were mostly intellectuals or journalists having sharply heterodox views about racial differences, especially those involving IQ and crime, and this was reflected in the somewhat euphemistic title, which stood for "Human Bio-Diversity." A reasonable sense of the controversial roster is that less than a year earlier a founding member named Glayde Whitney had contributed the Foreword to David Duke's 700 page opus *My Awakening*.

Although the discussions were intended to focus on scientific matters, it sometimes seemed that half the heated arguments revolved around immigration, and on that highly contentious topic, I was invariably outnumbered around 99-to-1, with even the handful of self-proclaimed liberals regularly ranging themselves against me. Despite such apparently long odds, I regarded myself as always victorious in all those endless debates, though I would have to admit that 99% of the audience probably had a different verdict.

Particularly contentious was the question of Hispanic immigrant crime rates, which I claimed were roughly the same as those of whites, a position that virtually all those professors and authors denounced as utter lunacy. That particular dispute went on for so many years that

eventually I no longer even bothered to argue the case, but just every now and then provided some satirical jibes on the topic.

As it happens, the late J. Philippe Rushton, longtime professor of Psychology at the University of Western Ontario, was a very occasional participant, and one of my jokes happened to catch his eye. Being a bit on the humorless side, he failed to comprehend that my remarks were actually tongue-in-cheek, and after three or four explanatory exchanges, I was finally forced to state my position as explicitly as possible: “Hispanics have approximately the same crime rates as whites of the same age.” He found my claim totally astonishing, saying that it contradicted absolutely everything he had learned about the topic and even threatened to overturn his entire ideological world-view, which he had so painstakingly built up over his previous thirty years of scientific investigation into human racial differences. Therefore, he said I couldn't possibly be right.

Now Rushton was then widely regarded as being the world’s foremost White Nationalist academic scholar, and he was basically saying that he would eat his own hat if my contradictory racial analysis proved correct. Such an intellectual challenge was just too tempting for me to resist, so I took a brief hiatus from my ongoing software project to work out the crime numbers.

The Myth of Immigrant Crime

Sure enough, the quantitative results came out exactly the way I knew they would, and I was quite pleased with my resulting cover story

"The Myth of Hispanic Crime" that ran in the March 2010 issue of *The American Conservative*. Not only did my detailed analysis eventually win over Prof. Rushton and most of my more thoughtful critics, but it also sparked an enormous Internet debate, and probably had widespread influence. I was puzzled at the time that such simple calculations had not previously been undertaken by America's vast army of pro-immigrant academics and journalists, and could only wonder whether they had deliberately avoided investigating the issue for fear that the claims of their anti-immigrant opponents would prove entirely correct. Regardless of the cause, for years afterward whenever I Googled "Hispanic Crime" or "Latino Crime", the search engine would turn up many tens of millions of web pages, but my own article was generally listed in the top five or six results, quite often in the top two or three. Even today, nearly a decade later, copies of my article still rank remarkably high in such searches on Google, Bing, and DuckDuckGo.

Was my controversial analysis actually correct? Well, when I moved to Palo Alto in 1992, neighboring East Palo Alto had America's highest per capita murder rate, which obviously made people here rather nervous. But then over the next 25 years, a vast flood of Hispanic immigrants, both legal and illegal, swept into the region, and the city became overwhelmingly Latino and immigrant. Perhaps coincidentally, the homicide rate fell by some 99%, with the last two years marred by only a single killing, a murder-suicide involving a couple of elderly white lesbians, while all other crime rates have also plummeted. Palo Alto is home to the CEOs of Google, Facebook, Apple, and numerous other leading tech companies, so perhaps rightwing activists should be less than totally mystified why their anti-immigrant zealotry has generally fallen on rather deaf ears within the Silicon Valley business community.

Although immigration and Hispanic crime were perennial topics in that HBD group, for a few years after the 9/11 attacks the latter issue was almost entirely displaced by feverish exchanges on Muslim terrorism and the accompanying Clash of Civilizations. Once again, I was invariably on the short end of a 99-to-1 divide, with nearly all the others in the group claiming that destruction of the World Trade Center conclusively proved that we needed to close our borders to foreign immigrants. I pointed out that since the Arab hijackers involved hadn't been immigrants, but had generally entered our country on tourist visas, maybe the "War on Terrorism" should be renamed the "War on Tourism," and we should protect America by

completely closing our borders to the horrifying risks of the latter. Yet everyone ignored my sage advice.

The 9/11 attacks themselves had astonished me as much as everyone else on the HBD list, but aside from carefully reading the developing story in the *New York Times* and my other morning newspapers, I was too busy with my work to otherwise follow the topic. At first, everyone seemed certain that there would soon be a wave of follow-up attacks by the dozens or perhaps even hundreds of other Islamic terrorists remaining in our country, but nothing like that ever happened. After a few weeks had gone by without any further explosions, even small ones, I told the other HBD listmembers that I now strongly suspected that every last Al Qaeda terrorist in America had probably died in the suicide attacks of September 11th, and there wasn't a single remaining operative left behind to commit further mayhem. Many of the others disagreed with me, but as the months and years went by, my surprising hypothesis turned out to be correct.

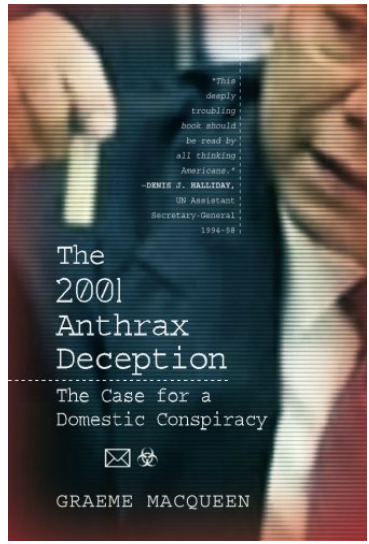
There was one important exception to this pattern, but it actually served to confirm the rule. As I wrote a few years ago in my original "American Pravda" article:

> Consider the almost forgotten anthrax mailing attacks in the weeks after 9/11, which terrified our dominant East Coast elites and spurred passage of the unprecedented Patriot Act, thereby eliminating many traditional civil-libertarian protections. Every morning during that period the *New York Times* and other leading newspapers carried articles describing the mysterious nature of the deadly attacks and the complete bafflement of the FBI investigators. But evenings on the Internet I would read stories by perfectly respectable journalists such as *Salon*'s Laura Rozen or the staff of the Hartford Courant providing a wealth of additional detail and pointing to a likely suspect and motive.
>
> Although the letters carrying the anthrax were purportedly written by an Arab terrorist, the FBI quickly determined that the language and style indicated a non-Arab author, while tests pointed to the bioweapons research facility at Ft. Detrick, Md., as the probable source of the material. But just prior to the arrival of those deadly mailings, military police at Quantico, Va., had also received an anonymous letter warning that a former Ft. Detrick employee, Egyptian-born Dr. Ayaad Assaad, might be planning to launch a national campaign of bioterrorism. Investigators quickly cleared Dr. Assaad, but the very detailed nature of the accusations revealed inside knowledge of his employment history and the Ft.

Detrick facilities. Given the near-simultaneous posting of anthrax envelopes and false bioterrorism accusations, the mailings almost certainly came from the same source, and solving the latter case would be the easiest means of catching the anthrax killer.

Who would have attempted to frame Dr. Assaad for bioterrorism? A few years earlier he had been involved in a bitter personal feud with a couple of his Ft. Detrick coworkers, including charges of racism, official reprimands, and angry recriminations all around. When an FBI official shared a copy of the accusatory letter with a noted language-forensics expert and allowed him to compare the text with the writings of 40 biowarfare lab employees, he found a perfect match with one of those individuals. For years I told my friends that anyone who spent 30 minutes with Google could probably determine the name and motive of the likely anthrax killer, and most of them successfully met my challenge.

This powerful evidence received almost no attention in the major national media, nor is there any indication that the FBI ever followed up on any of these clues or interrogated the named suspects. Instead, investigators attempted to pin the attacks on a Dr. Steven Hatfill based on negligible evidence, after which he was completely exonerated and won a $5.6 million settlement from the government for its years of severe harassment. Later, similar hounding of researcher Bruce Ivins and his family led to his suicide, after which the FBI declared the case closed, even though former colleagues of Dr. Ivins demonstrated that he had had no motive, means, or opportunity. In 2008, I commissioned a major 3,000-word cover story in my magazine summarizing all of this crucial evidence, and once again almost no one in the mainstream media paid the slightest attention.



"This deeply troubling book should be read by all thinking Americans."
-DENIS J. HALLIDAY, UN Assistant Secretary-General 1994-98
The 2001 Anthrax Deception
The Case for a Domestic Conspiracy
GRAEME MACQUEEN

Unlike the 9/11 attacks themselves, I had closely followed the Anthrax terrorism, and was shocked by the strange silence of the government investigators and our leading newspapers. At the time, I generally assumed that the attacks were totally unconnected with 9/11 and merely opportunistic, but I simply couldn't understand how a few minutes a day of reading *Salon* and the *Hartford Courant* on the web could seemingly solve the front-page mystery that was baffling everyone at the FBI and the *New York Times*. It was around that point when I first started to wonder whether the elite media publications I had always relied upon were merely "Our American Pravda" under a different name. Moreover, a 2014 book by Prof. Graeme MacQueen that I only very recently discovered has made a reasonably persuasive case that the Anthrax killings were intimately connected to the 9/11 attacks themselves, greatly magnifying the malfeasance of our media elites.

In theoretical physics, new scientific breakthroughs often occur when known objects are found to behave in inexplicable ways, thereby suggesting the existence of previously unsuspected forces or particles. In evolutionary biology, when an organism appears to be acting against its own genetic interests, we may safely assume that it has probably fallen under the control of some other entity, typically a parasite, which has hijacked the host and is directing its activities toward different ends. While I couldn't be entirely sure what was happening to the politics and media of my own country, something very odd and disturbing was certainly taking place.

Things soon became much worse. Since the 9/11 attacks had apparently been organized by Osama bin Laden and he was based in Afghanistan under Taliban protection, our attack on that country at least seemed rational. But suddenly there also soon appeared talk of attacking Saddam Hussein's Iraq, which made absolutely no sense whatsoever.

At first I couldn't believe what was taking place, simply awed by the breathtaking power and dishonesty of "our American Pravda," with the establishment media so easily transforming black into white and night into day. Once again, quoting from my original article of that title:

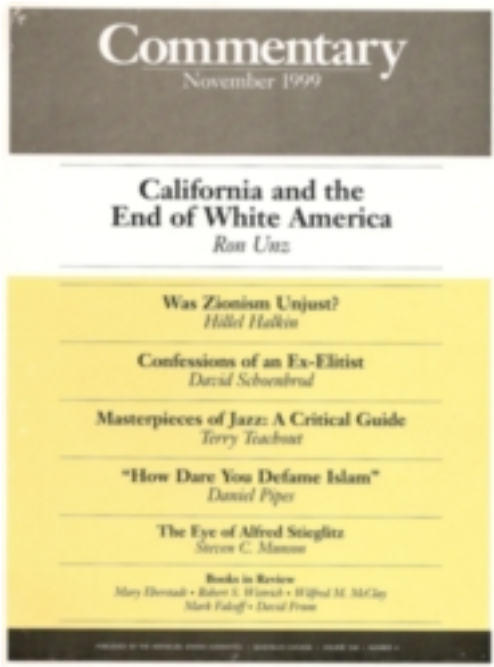
> The circumstances surrounding our Iraq War demonstrate this, certainly ranking it among the strangest military conflicts of modern times. The 2001 attacks in America were quickly ascribed to the radical Islamists of al-Qaeda, whose bitterest enemy in the Middle East had always been Saddam Hussein's secular Baathist regime in Iraq. Yet through misleading public statements, false press leaks, and even forged evidence such as the "yellowcake" documents, the Bush administration and its neoconservative allies utilized the compliant American media to persuade our citizens that Iraq's nonexistent WMDs posed a deadly national threat and required elimination by war and invasion. Indeed, for several years national polls showed that a large majority of conservatives and Republicans actually believed that Saddam was the mastermind behind 9/11 and the Iraq War was being fought as retribution. Consider how bizarre the history of the 1940s would seem if America had attacked China in retaliation for Pearl Harbor.
>
> True facts were easily available to anyone paying attention in the years after 2001, but most Americans do not bother and simply draw their understanding of the world from what they are told by the major media, which overwhelmingly—almost uniformly—backed the case for war with Iraq; the talking heads on TV created our reality. Prominent journalists across the liberal and conservative spectrum eagerly published the most ridiculous lies and distortions passed on to them by anonymous sources, and stampeded Congress down the path to war.
>
> The result was what my late friend Lt. Gen. Bill Odom rightly called the "greatest strategic disaster in United States history." American forces suffered tens of thousands of needless deaths and injuries, while our country took a huge step toward national

bankruptcy. Economics Nobel Laureate Joseph Stiglitz and others have estimated that with interest the total long-term cost of our two recent wars may reach as high as $5 or $6 trillion, or as much as $50,000 per American household, mostly still unpaid. Meanwhile, economist Edward Wolff has calculated that the Great Recession and its aftermath cut the personal net worth of the median American household to $57,000 in 2010 from a figure nearly twice as high three years earlier. Comparing these assets and liabilities, we see that the American middle class now hovers on the brink of insolvency, with the cost of our foreign wars being a leading cause.

But no one involved in the debacle ultimately suffered any serious consequences, and most of the same prominent politicians and highly paid media figures who were responsible remain just as prominent and highly paid today. For most Americans, reality is whatever our media organs tell us, and since these have largely ignored the facts and adverse consequences of our wars in recent years, the American people have similarly forgotten. Recent polls show that only half the public today believes that the Iraq War was a mistake.

Author James Bovard has described our society as an attention deficit democracy, and the speed with which important events are forgotten once the media loses interest might surprise George Orwell.

As President George W. Bush began inexorably moving America toward the Iraq War in 2002, I realized with a terrible sinking feeling that the notoriously pro-Israel Neocon zealots had somehow managed to seize control of the foreign policy of his administration, a situation I could never have imagined even in my worst nightmare.

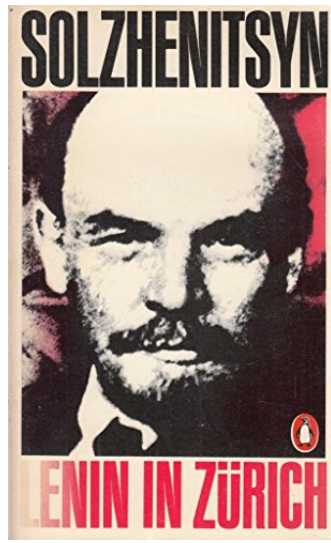


Throughout the 1990s and even afterward, I'd been on very friendly terms with the Neocons in NYC and DC, working closely with them on issues relating to immigration and assimilation. Indeed, my December 1999 article "California and the End of White America" was not only one of the longest cover stories ever published in *Commentary*, their intellectual flagship, but had even been cited as the centerpiece of its annual fund-raising letter.

I and my other DC friends were well aware of the fanatical views most Neocons held on Israel and Middle Eastern policy, with their foreign policy obsessions being a regular staple of our jokes and ridicule. But since it seemed unimaginable that they would ever be given any authority in that sphere, their beliefs had seemed a relatively harmless eccentricity. After all, could anyone possibly imagine fanatical libertarians being placed in total control of the Pentagon, allowing them to immediately disband the American armed forces as a "statist institution"?

Moreover, the complete ideological triumph of the Neocons after the 9/11 attacks was all the more shocking given the crushing recent political defeat they had suffered. During the 2000 presidential campaign, nearly all of the Neocons had aligned themselves with Sen. John McCain, whose battle with Bush for the Republican nomination had eventually turned quite bitter, and as a consequence, they had been almost entirely frozen out of any high-level appointments. Both

Vice President Dick Cheney and Defense Secretary Donald Rumsfeld were then widely regarded as Bush Republicans, lacking any significant Neocon ties, and the same was true for all the other top administration figures such as Colin Powell, Condeleeza Rice, and Paul O'Neil. Indeed, the only Neoconservative offered a Cabinet spot was Linda Chavez, and not only was the Labor Department always regarded as something of a boobie prize in a GOP Administration, but she was ultimately forced to withdraw her nomination due to her "nanny problems." The highest-ranking Neocon serving under Bush was Rumsfeld Deputy Paul Wolfowitz, whose seemingly inconsequential appointment had passed without any notice.



Most of the Neocons themselves certainly seemed to recognize the catastrophic loss they had suffered in the 2000 election. Back in those days, I was on very friendly terms with Bill Kristol, and when I stopped by his office at the *Weekly Standard* for a chat in the spring of 2001, he seemed in a remarkably depressed state of mind. I remember that at one point, he took his head in his hands and wondered aloud whether it was time for him to just abandon the political battle, resigning his editorship and taking up a quiet post at a DC thinktank. Yet just eight or ten months later, he and his close allies were on their way to gaining overwhelming influence in our government. In an eerie parallel to the story told in Alexander Solzhenitsyn's *Lenin in Zurich,* the totally fortuitous 9/11 attacks and the outbreak of war had suddenly allowed a small but determined ideological faction to seize control of a gigantic country.

A thorough account of the Neocons and their takeover of the Bush Administration in the aftermath of 9/11 is provided by Dr. Stephen J.

Sniegoski in his 2008 book The Transparent Cabal, conveniently available on this website:

- The Transparent Cabal
  *The Neoconservative Agenda, War in the Middle East, and the National Interest of Israel*
  Stephen J. Sniegoski • 2008 • 178,000 Words

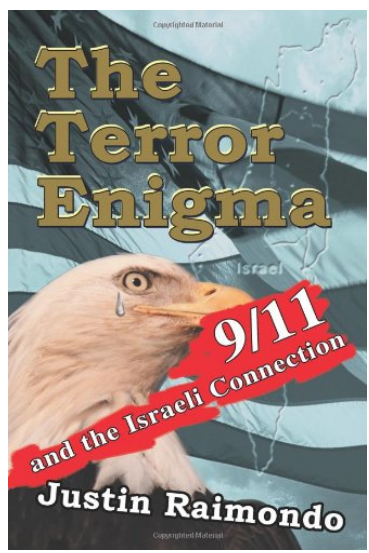
Oddly enough, for many years after 9/11, I paid very little attention to the details of the attacks themselves. I was entirely preoccupied with building my content-archiving software system, and with the little time I could spare for public policy matters, I was totally focused to the ongoing Iraq War disaster, as well as my terrible fears that Bush might at any moment suddenly extend the conflict to Iran. Despite Neocon lies shamelessly echoed by our corrupt media, neither Iraq nor Iran had had anything whatsoever to do with the 9/11 attacks, so those events gradually faded in my consciousness, and I suspect the same was true for most other Americans. Al Qaeda had largely disappeared and Bin Laden was supposedly hiding in a cave somewhere. Despite endless Homeland Security "threat alerts," there had been no further Islamic terrorism on American soil, and relatively little anywhere else outside of the Iraq charnel house. So the precise details of the 9/11 plots had become almost irrelevant to me.

Others I knew seemed to feel the same way. Virtually all the exchanges I had with my old friend Bill Odom, the three-star general who had run the NSA for Ronald Reagan, had concerned the Iraq War and risk it might spread to Iran, as well as the bitter anger he felt toward Bush's perversion of his beloved NSA into an extra-constitutional tool of domestic espionage. When the *New York Times* broke the story of the massive extent of domestic NSA spying, Gen. Odom declared that President Bush should be impeached and NSA Director Michael Hayden court-martialed. But in all the years prior to his untimely passing in 2008, I don't recall the 9/11 attacks themselves even once coming up as a topic in our discussions.

During those same years, I'd also grown quite friendly with Alexander Cockburn, whose *Counterpunch* webzine seemed a very rare center of significant opposition to our disastrous foreign policy towards Iraq and Iran. I do recall that he once complained to me in 2006 about the "conspiracy nuts" of the 9/11 Truth movement who were endlessly harassing his publication, and I extended my sympathies. Each of us moves in different political circles, and that brief reference may have

been the first and only time I heard of the 9/11 Truthers during that period, causing me to regard them more like an eccentric UFO cult than anything else.

Admittedly, I'd occasionally heard of some considerable oddities regarding the 9/11 attacks here and there, and these certainly raised some suspicions. Most days I would glance at the *Antiwar.com* front page, and it seemed that some Israeli Mossad agents had been caught while filming the plane attacks in NYC, while a much larger Mossad "art student" spy operation around the country had also been broken up around the same time. Apparently, *FoxNews* had even broadcast a multi-part series on the latter topic before that expose was scuttled and "disappeared" under ADL pressure.



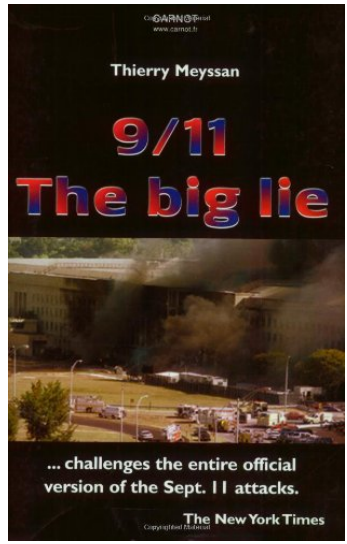
Although I wasn't entirely sure about the credibility of those claims, it did seem plausible that Mossad had known of the attacks in advance and allowed them to proceed, recognizing the huge benefits that Israel would derive from the anti-Arab backlash. I think I was vaguely aware that *Antiwar.com* editorial director Justin Raimondo had published *The Terror Enigma*, a short book about some of those strange facts, bearing the provocative subtitle "9/11 and the Israeli Connection," but I never considered reading it. In 2007, *Counterpunch* itself published a fascinating follow-up story about the arrest of that group of Israeli Mossad agents in NYC, who were caught filming and apparently celebrating the plane attacks on that fateful day, and the Mossad activity seemed to be far larger than I had previously realized. But all these details remained a little fuzzy in my mind next to my overriding concerns about wars in Iraq and Iran.

However, by the end of 2008 my focus had begun to change. Bush was leaving office without having started an Iranian war, and America had successfully dodged the bullet of an even more dangerous John McCain administration. I assumed that Barack Obama would be a terrible president and he proved worse than my expectations, but I still breathed a huge sigh of relief every day that he was in the White House.

Moreover, around that same time I'd stumbled across an astonishing detail of the 9/11 attacks that demonstrated the remarkable depths of my own ignorance. In a *Counterpunch* article, I'd discovered that immediately following the attacks, the supposed terrorist mastermind Osama bin Laden had publicly denied any involvement, even declaring that no good Muslim would have committed such deeds.

Once I checked around a little and fully confirmed that fact, I was flabbergasted. 9/11 was not only the most successful terrorist attack in the history of the world, but may have been greater in its physical magnitude than all past terrorist operations combined. The entire purpose of terrorism is to allow a small organization to show the world that it can inflict serious losses upon a powerful state, and I had never previously heard of any terrorist leader denying his role in a successful operation, let alone the greatest in history. Something seemed extremely wrong in the media-generated narrative that I had previously accepted. I began to wonder if I had been as deluded as the tens of millions of Americans in 2003 and 2004 who naively believed that Saddam had been the mastermind behind the September 11th attacks. We live in a world of illusions generated by our media, and I suddenly felt that I had noticed a tear in the paper-mache mountains displayed in the background of a Hollywood sound-stage. If Osama was probably not the author of 9/11, what other huge falsehoods had I blindly accepted?

A couple of years later, I came across a very interesting column by Eric Margolis, a prominent Canadian foreign policy journalist purged from the broadcast media for his strong opposition to the Iraq War. He had long published a weekly column in the *Toronto Sun* and when that tenure ended, he used his closing appearance to run a double-length piece expressing his very strong doubts about the official 9/11 story, even noting that the former director of Pakistani Intelligence insisted that Israel had been behind the attacks.



In addition, an old friend of mine with strong connections to elite French circles at some point shared what he regarded as an amusing anecdote. He mentioned that at a private dinner party in Paris attended by influential political and media figures, France's former Defense Minister had told the other disbelieving guests that the Pentagon had been struck by a missile rather than a civilian jetliner. My friend explained that the minister in question was widely regarded as extremely intelligent and level-headed, thereby proving that even the most highly reputable individuals might sometimes believe in utterly crazy things.

But I interpreted those same facts very differently. France probably possessed one of the four or five best intelligence services in the world, and surely a French Defense Minister would be privy to better information about true events than a typical media pundit. In fact, one of the earliest books sharply questioning the official 9/11 narrative was *9/11: The Big Lie* by French journalist Thierry Meyssan, which appeared in 2002. This book had similarly argued that the Pentagon had been struck by a missile, perhaps suggesting that it may have been partly influenced by leaks coming from French Intelligence.

I later shared that account of the French minister's private opinions with a very well-connected American individual situated in our elite Establishment with whom I'd become a little friendly. His reaction made it clear that he held the same highly unorthodox views about the 9/11 attacks, although he had never publicly voiced them lest he risk losing his elite Establishment membership card.

I eventually discovered that in 2003 former German Cabinet Minister

Andreas von Bülow had published a best-selling book strongly suggesting that the CIA rather than Bin Laden was behind the attacks, while in 2007 former Italian President Francesco Cossiga had similarly argued that the CIA and the Israeli Mossad had been responsible, claiming that fact was well known among Western intelligence agencies.

Over the years, all these discordant claims had gradually raised my suspicions about the official 9/11 story to rather strong levels, but it was only very recently that I finally found the time to begin to seriously investigate the subject and read eight or ten of the main 9/11 Truther books, mostly those by Prof. David Ray Griffin, the widely acknowledged leader in that field. And his books, together with the writings of his numerous colleagues and allies, revealed all sorts of very telling details, most of which had previously been unknown to me. I was also greatly impressed by the sheer number of seemingly reputable individuals of no apparent ideological bent who had become adherents of the 9/11 Truth movement over the years.

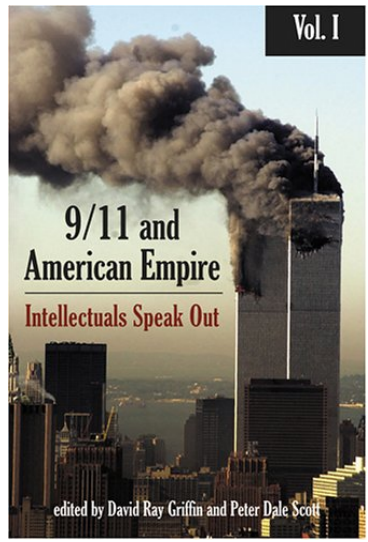
DEBUNKING
9/11
MYTHS
WHY CONSPIRACY THEORIES CAN'T STAND UP TO THE FACTS
FOREWORD BY JAMES B. MEIGS
EDITED BY DAVID DUNBAR & BRAD REAGAN
AN IN-DEPTH INVESTIGATION BY POPULAR MECHANICS

I naturally attempted to locate contrary books supporting the official 9/11 story, but the only one widely discussed was a rather short volume published by *Popular Mechanics* magazine, whose lead researcher turned out to be the cousin of Homeland Security chief Michael Chertoff. None of the writers appeared to have any serious academic credentials, and they seemed to generally ignore or deflect some of the strongest pieces of evidence provided by the numerous scholars and experts involved in the 9/11 Truth movement. So I hardly found their rebuttal persuasive, and I half-wondered whether

Homeland Security had quietly arranged the publication, which might help explain the extremely odd nepotistic coincidence. Popular magazines simply do not carry the scientific weight of research professors at major universities. Perhaps the holes in the official 9/11 narrative were so numerous and large that no serious scholar could be enlisted to defend it.



When utterly astonishing claims of an extremely controversial nature are made over a period of many years by numerous seemingly reputable academics and other experts, and they are entirely ignored or suppressed but never effectively rebutted, reasonable conclusions seem to point in an obvious direction. Based on my very recent readings in this topic, the total number of huge flaws in the official 9/11 story has now grown extremely long, probably numbering in the many dozens. Most of these individual items seem reasonably likely and if we decide that even just two or three of them are correct, we must totally reject the official narrative that so many of us have believed for so long.

The numerous Griffin books, beginning with his important 2004 volume *The New Pearl Harbor*, provide a very helpful evolving compendium of these. Although they all contain a great deal of overlap I might emphasize *Debunking 9/11 Debunking*, a 2007 reply to the *Popular Mechanics* volume, and the 2008 book *The New Pearl Harbor Revisited* as among the more important ones. In addition, he co-edited an important 2007 collection of essays with scholar Peter Dale Scott entitled *9/11 and American Empire*. For those too cheap or impatient to click a button and order something from Amazon, I'm pleased to provide three of the shorter Griffin books in HTML form:

- 9/11 Contradictions
  David Ray Griffin • 2008 • 110,000 Words
- 9/11 Ten Years Later
  David Ray Griffin • 2011 • 116,000 Words
- Cognitive Infiltration
  David Ray Griffin • 2011 • 66,000 Words

Now I am merely just an amateur in the complex intelligence craft of extracting nuggets of truth from a mountain of manufactured falsehood. Although the arguments of the 9/11 Truth Movement seemed quite persuasive to me, I would obviously have felt much more comfortable if they were seconded by an experienced professional, such as a top CIA analyst. A few years ago, I was shocked to discover that was indeed the case.

William Christison had spent 29 years at the CIA, rising to become one of its senior figures as Director of its Office of Regional and Political Analysis, with 200 research analysts serving under him. In August 2006, he published a remarkable 2,700 word article explaining why he no longer believed the official 9/11 story and felt sure that the 9/11 Commission Report constituted a cover-up, with the truth being quite different. The following year, he provided a forceful endorsement to one of Griffin's books, writing that "[There's] a strong body of evidence showing the official U.S. Government story of what happened on September 11, 2001 to be almost certainly a monstrous series of lies." And Christison's extreme 9/11 skepticism was seconded by that of many other highly-regarded former US intelligence professionals.

We might expect that if a former CIA intelligence officer of Christison's rank were to denounce the official 9/11 report as a fraud and a cover-up, such a story would constitute front-page news. But it was never reported anywhere in our mainstream media, and I only stumbled upon it a decade later.

Even our supposed "alternative" media outlets were nearly as silent. Throughout the 2000s, Christison and his wife Kathleen, also a former CIA analyst, had been regular contributors to *Counterpunch*, publishing many dozens of articles there and certainly being its most highly-credentialed writers on intelligence and national security matters. But editor Alexander Cockburn refused to publish any of their 9/11 skepticism, so it never came to my attention at the time. Indeed, when I mentioned Christison's views to current *Counterpunch* editor Jeffrey

St. Clair a couple of years ago, he was stunned to discover that the friend he had regarded so very highly had actually become a "9/11 Truther." When media organs serve as ideological gatekeepers, a condition of widespread ignorance becomes unavoidable.

For those so interested, Christison's 2006 article mentioned the strong evidence he found in a C-Span broadcast of a two-hour panel discussion on the September 11th terrorist attacks, and he especially cited the documentary *Loose Change* as an excellent summary of many of the flaws in the official 9/11 case. The full "Final Cut" version of that film is conveniently available on YouTube:

[Video no longer available]

With so many gaping holes in the official story of the events of seventeen years ago, each of us is free to choose to focus on those we personally consider most persuasive, and I have several of my own. Danish Chemistry professor Niels Harrit was one of the scientists who analyzed the debris of the destroyed buildings and detected the residual presence of nano-thermite, a military-grade explosive compound, and I found him quite credible during his hour-long interview on *Red Ice Radio*. The notion that an undamaged hijacker passport was found on an NYC street after the massive, fiery destruction of the skyscrapers is totally absurd, as was the claim that the top hijacker conveniently lost his luggage at one of the airports and it was found to contain a large mass of incriminating information. The testimonies of the dozens of firefighters who heard explosions just before the collapse of the buildings seems totally inexplicable under the official account. The sudden total collapse of Building Seven, never hit by any jetliners is also extremely implausible.

Let us now suppose that the overwhelming weight of evidence is correct, and concur with high-ranking former CIA intelligence analysts, distinguished academics, and experienced professionals that the 9/11 attacks were not what they appeared to be. We recognize the extreme implausibility that three huge skyscrapers in New York City suddenly collapsed at free-fall velocity into their own footprints after just two of them were hit by airplanes, and also that a large civilian jetliner probably did not strike the Pentagon leaving behind absolutely no wreckage and only a small hole. What actually did happen, and more importantly, who was responsible?

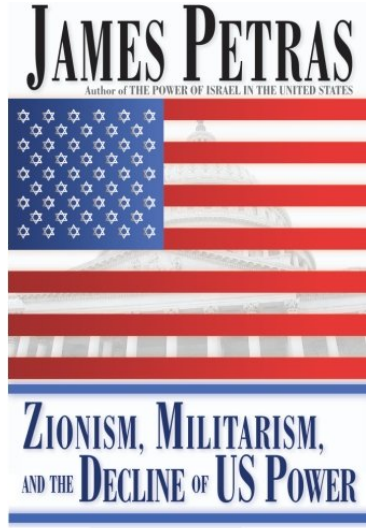
The first question is obviously impossible to answer without an honest

and thorough official investigation of the evidence. Until that occurs, we should not be surprised that numerous, somewhat conflicting hypotheses have been advanced and debated within the confines of the 9/11 Truth community. But the second question is probably the more important and relevant one, and I think it has always represented a source of extreme vulnerability to 9/11 Truthers.

The most typical approach, as generally followed in the numerous Griffin books, is to avoid the issue entirely and focus solely on the gaping flaws in the official narrative. This is a perfectly acceptable position but leaves all sorts of serious doubts. What organized group would have been sufficiently powerful and daring to carry off an attack of such vast scale against the central heart of the world's sole superpower? And how were they possibly able to orchestrate such a massively effective media and political cover-up, even enlisting the participation of the U.S. government itself?

The much smaller fraction of 9/11 Truthers who choose to address this "whodunit" question seem to be overwhelmingly concentrated among rank-and-file grassroots activists rather than the prestigious experts, and they usually answer "inside job!" Their widespread belief seems to be that the top political leadership of the Bush Administration, probably including Vice President Dick Cheney and Defense Secretary Donald Rumsfeld, had organized the terrorist attacks, either with or without the knowledge of their ignorant nominal superior, President George W. Bush. The suggested motives included justifying military attacks against various countries, supporting the financial interests of the powerful oil industry and military-industrial complex, and enabling the destruction of traditional American civil liberties. Since the vast majority of politically-active Truthers seem to come from the far left of the ideological spectrum, they regard these notions as logical and almost self-evident.

Although not explicitly endorsing those Truther conspiracies, filmmaker Michael Moore's leftist box office hit *Fahrenheit 9/11* seemed to raise such similar suspicions. His small budget documentary earned an astonishing $220 million by suggesting that the very close business ties between the Bush family, Cheney, the oil companies, and the Saudis were responsible for the Iraq War aftermath of the terrorist attacks, as well as the domestic crackdown on civil liberties, which was part-and-parcel of the right-wing Republican agenda.



Unfortunately, this apparently plausible picture seems to have almost no basis in reality. During the drive to the Iraq War, I read *Times* articles interviewing numerous top oil men in Texas who expressed total puzzlement at why America was planning to attack Saddam, saying that they could only assume that President Bush knew something that they themselves did not. Saudi Arabian leaders were adamantly opposed to an American attack on Iraq, and made every effort to prevent it. Prior to his joining the Bush Administration, Cheney had served as CEO of Halliburton, an oil services giant, and his firm had heavily lobbied for the lifting of U.S. economic sanctions against Iraq. Prof. James Petras, a scholar of strong Marxist leanings, published an excellent 2008 book entitled *Zionism, Militarism, and the Decline of US Power* in which he conclusively demonstrated that Zionist interests rather than those of the oil industry had dominated the Bush Administration in the wake of the 9/11 attacks, and promoted the Iraq War.

As for the Michael Moore film, I remember at the time sharing a laugh with a (Jewish) friend of mine, both of us finding it ridiculous that a government so overwhelmingly permeated by fanatically pro-Israel Neocons was portrayed as being in thrall to the Saudis. Not only did the plotline of Moore's film demonstrate the fearsome power of Jewish Hollywood, but its huge success suggested that most of the American public had apparently never heard of the Neocons.

Bush critics properly ridiculed the president for his tongue-tied statement that the 9/11 terrorists had attacked America "for its freedoms" and Truthers have reasonably branded as implausible the

claims that the massive attacks were organized by a cave-dwelling Islamic preacher. But the suggestion that that they were led and organized by the top figures of the Bush Administration seems even more preposterous.

Cheney and Rumsfeld had both spent decades as stalwarts of the moderate pro-business wing of the Republican Party, each serving in top government positions and also as CEOs of major corporations. The notion that they capped their careers by joining a new Republican administration in early 2001 and almost immediately set about organizing a gigantic false-flag terrorist attack upon the proudest towers of our largest city together with our own national military headquarters, intending to kill many thousands of Americans in the process, is too ridiculous to even be part of a leftist political satire.

Let's step back a bit. In the entire history of the world, I can think of no documented case in which the top political leadership of a country has launched a major false-flag attack upon its own centers of power and finance and tried to kill large numbers of its own people. The America of 2001 was a peaceful and prosperous country run by relatively bland political leaders focused upon the traditional Republican goals of enacting tax-cuts for the rich and reducing environmental regulations. Too many Truther activists have apparently drawn their understanding of the world from the caricatures of leftist comic-books in which corporate Republicans are all diabolical Dr. Evils, seeking to kill Americans out of sheer malevolence, and Alexander Cockburn was absolutely correct to ridicule them at least on that particular score.

Consider also the simple practicalities of the situation. The gigantic nature of the 9/11 attacks as postulated by the Truth movement would have clearly required enormous planning and probably involved the work of many dozens or even hundreds of skilled agents. Ordering CIA operatives or special military units to organize secret attacks against civilian targets in Venezuela or Yemen is one thing, but directing them to mount attacks against the Pentagon and the heart of New York City would be fraught with stupendous risk.

Bush had lost the popular vote in November 2000 and had only reached the White House because of a few dangling chads in Florida and the controversial decision of a deeply divided Supreme Court. As a consequence, most of the American media regarded his new administration with enormous hostility. If the first act of such a

newly-sworn presidential team had been ordering the CIA or the military to prepare attacks against New York City and the Pentagon, surely those orders would have been regarded as issued by a group of lunatics, and immediately leaked to the hostile national press.

The whole scenario of top American leaders being the masterminds behind 9/11 is beyond ridiculous, and those 9/11 Truthers who make or imply such claims—doing so without a single shred of solid evidence—have unfortunately played a major role in discrediting their entire movement. In fact, the common meaning of the "inside job" scenario is so patently absurd and self-defeating that one might even suspect that the claim was encouraged by those seeking to discredit the entire 9/11 Truth movement as a consequence.

The focus on Cheney and Rumsfeld seems particularly ill-directed. Although I've never met nor had any dealings with either of those individuals, I was quite actively involved in DC politics during the 1990s, and can say with some assurance that prior to 9/11, neither of them were regarded as Neocons. Instead, they were the archetypical examples of moderate business-type mainstream Republicans, stretching all the way back to their years at the top of the Ford Administration during the mid-1970s.

Skeptics of this claim may note that they signed the 1997 declaration issued by the Project for the New American Century (PNAC), a leading Neocon foreign policy manifesto organized by Bill Kristol, but I would regard that as something of a red herring. In DC circles, individuals are always recruiting their friends to sign various declarations, which may or may not be indicative of anything, and I remember Kristol trying to get me to sign the PNAC statement as well. Since my private views on that issue were absolutely 100% contrary to the Neocon position, which I regarded as foreign policy lunacy, I deflected his request and very politely turned him down. But I was quite friendly with him at the time, so if I had been someone without strong opinions in that area, I probably would have agreed.

This raises a larger point. By 2000, the Neocons had gained almost total control of all the major conservative/Republican media outlets and the foreign policy wings of nearly all the similarly aligned thinktanks in DC, successfully purging most of their traditional opponents. So although Cheney and Rumsfeld were not themselves Neocons, they were swimming in a Neocon sea, with a very large fraction of all the information they received coming from such sources and with their top aides such as "Scooter" Libby, Paul Wolfowitz, and Douglas Feith being Neocons. Rumsfeld was already somewhat elderly

while Cheney had suffered several heart-attacks starting at age 37, so under those circumstances it may have been relatively easy for them to be shifted toward certain policy positions.

Indeed, the entire demonization of Cheney and Rumsfeld in anti-Iraq War circles has seemed somewhat suspicious to me. I always wondered whether the heavily Jewish liberal media had focused its wrath upon those two individuals in order to deflect culpability from the Jewish Neocons who were the obvious originators of that disastrous policy; and the same may be true of the 9/11 Truthers, who probably feared accusations of anti-Semitism. Regarding that former issue, a prominent Israeli columnist was characteristically blunt on the matter in 2003, strongly suggesting that 25 Neocon intellectuals, nearly all of them Jewish, were primarily responsible for the war. Under normal circumstances, the president himself would have surely been portrayed as the evil mastermind behind the 9/11 plot, but "W" was too widely known for his ignorance for such accusations to be credible.

It does seem entirely plausible that Cheney, Rumsfeld, and other top Bush leaders may have been manipulated into taking certain actions that inadvertently fostered the 9/11 plot, while a few lower-level Bush appointees might have been more directly involved, perhaps even as outright conspirators. But I do not think this is the usual meaning of the "inside job" accusation.

So where do we now stand? It seems very likely that the 9/11 attacks were the work of an organization far more powerful and professionally-skilled than a rag-tag band of nineteen random Arabs armed with box-cutters, but also that the attacks were very unlikely to have been the work of the American government itself. So who actually attacked our country on that fateful day seventeen years ago, killing thousands of our fellow citizens?

Effective intelligence operations are concealed in a hall of mirrors, often extremely difficult for outsiders to penetrate, and false-flag terrorist attacks certainly fall into this category. But if we apply a different metaphor, the complexities of such events may be seen as a Gordian Knot, almost impossible to disentangle, but vulnerable to the sword-stroke of asking the simple question "Who benefited?"

America and most of the world certainly did not, and the disastrous legacies of that fateful day have transformed our own society and

wrecked many other countries. The endless American wars soon unleashed have already cost us many trillions of dollars and set our nation on the road to bankruptcy while killing or displacing many millions of innocent Middle Easterners. Most recently, that resulting flood of desperate refugees has begun engulfing Europe, and the peace and prosperity of that ancient continent is now under severe threat.

Our traditional civil liberties and constitutional protections have been drastically eroded, with our society having taken long steps toward becoming an outright police state. American citizens now passively accept unimaginable infringements on their personal freedoms, all originally begun under the guise of preventing terrorism.

I find it difficult to think of any country in the world that clearly gained as a result of the 9/11 attacks and America's military reaction, with one single, solitary exception.

During 2000 and most of 2001, America was a peaceful prosperous country, but a certain small Middle Eastern nation had found itself in an increasingly desperate situation. Israel then seemed to be fighting for its life against the massive waves of domestic terrorism that constituted the Second Palestinian Intifada.

Ariel Sharon was widely believed to have deliberately provoked that uprising in September 2000 by marching to the Temple Mount backed by a thousand armed police, and the resulting violence and polarization of Israeli society had successfully installed him as Prime Minister in early 2001. But once in office, his brutal measures failed to end the wave of continuing attacks, which increasingly took the form of suicide-bombings against civilian targets. Many believed that the violence might soon trigger a huge outflow of Israeli citizens, perhaps producing a death-spiral for the Jewish state. Iraq, Iran, Libya, and other major Muslim powers were supporting the Palestinians with money, rhetoric, and sometimes weaponry, and Israeli society seemed close to crumbling. I remember hearing from some of my DC friends that numerous Israeli policy experts were suddenly seeking berths at Neocon thinktanks so that they could relocate to America.

Sharon was a notoriously bloody and reckless leader, with a long history of undertaking strategic gambles of astonishing boldness, sometimes betting everything on a single roll of the dice. He had spent decades seeking the Prime Ministership, but having finally obtained it, he now had his back to the wall, with no obvious source of rescue in sight.

The 9/11 attacks changed everything. Suddenly the world's sole superpower was fully mobilized against Arab and Muslim terrorist movements, especially those connected with the Middle East. Sharon's close Neocon political allies in America used the unexpected crisis as an opportunity to seize control of America's foreign policy and national security apparatus, with an NSA staffer later reporting that Israeli generals freely roamed the halls of the Pentagon without any security controls. Meanwhile, the excuse of preventing domestic terrorism was used to implement newly centralized American police controls that were soon employed to harass or even shut down various anti-Zionist political organizations. One of the Israeli Mossad agents arrested by the police in New York City as he and his fellows were celebrating the 9/11 attacks and producing a souvenir film of the burning World Trade Center towers told the officers that "We are Israelis…Your problems are our problems." And so they immediately became.

General Wesley Clark reported that soon after the 9/11 attacks he was informed that a secret military plan had somehow come into being under which America would attack and destroy seven major Muslim countries over the next few years, including Iraq, Iran, Syria, and Libya, which coincidentally were all of Israel's strongest regional adversaries and the leading supporters of the Palestinians. As America began to expend enormous oceans of blood and treasure attacking all of Israel's enemies after 9/11, Israel itself no longer needed to do so. Partly as a consequence, almost no other nation in the world has so enormously improved its strategic and economic situation during the last seventeen years, even while a large fraction of the American population has become completely impoverished during that same period and our national debt has grown to insurmountable levels. A parasite can often grow fat even as its host suffers and declines.

I have emphasized that for many years after the 9/11 attacks I paid little attention to the details and had only the vaguest notion that there even existed an organized 9/11 Truth movement. But if someone had ever convinced me that the terrorist attacks had been false-flag operations and someone other than Osama had been responsible, my immediate guess would have been Israel and its Mossad.

Certainly no other nation in the world can remotely match Israel's track-record of remarkably bold high-level assassinations and false-flag attacks, terrorist and otherwise, against other countries, even including America and its military. Furthermore, the enormous

dominance of Jewish and pro-Israel elements in the American establishment media and increasingly that of many other major countries in the West has long ensured that even when the solid evidence of such attacks was discovered, very few ordinary Americans would ever hear those facts.

The pattern of behavior is really quite remarkable. Even prior to the establishment of the State of Israel, the various Zionist factions assassinated Lord Moyne, the British Minister for the Middle East, and Count Folke Bernadotte, the UN Peace Negotiator, and made unsuccessful attempts to kill President Harry S. Truman and British Foreign Minister Ernest Bevin, while even discussing the possible assassination of Prime Minister Winston Churchill. There seems considerable evidence that the Israeli Mossad subsequently played a central role in the assassination of President John F. Kennedy because of the enormous pressure he was applying to persuade Israel to abandon its nuclear weapons development. Mossad defector Victor Ostrovsky warned the American government that Israel was planning to assassinate President George H.W. Bush in the early 1990s due to the bitter conflict over financial aid, and apparently those warnings were taken seriously. As recently as 2012, the editor of the largest Jewish newspaper in Atlanta publicly called for the assassination of President Barack Obama over his policy differences with Israel.

The history of military and terrorist attacks is even more striking. One of history's largest terrorist attacks prior to 9/11 was the 1946 bombing of the King David Hotel in Jerusalem by Zionist militants dressed as Arabs, which killed 91 people and largely destroyed the structure. In the famous Lavon Affair of 1954, Israeli agents launched a wave of terrorist attacks against Western targets in Egypt, intending to have those blamed on anti-Western Arab groups. There are strong claims that in 1950 Israeli Mossad agents began a series of false-flag terrorist bombings against Jewish targets in Baghdad, successfully using those violent methods to help persuade Iraq's thousand-year-old Jewish community to emigrate to the Jewish state. In 1967, Israel launched a deliberate air and sea attack against the *U.S.S. Liberty*, intending to leave no survivors, killing or wounding over 200 American servicemen before word of the attack reached our Sixth Fleet and the Israelis withdrew.

The enormous extent of pro-Israel influence in world political and media circles meant that none of these brutal attacks ever drew serious retaliation, and in nearly all cases, they were quickly thrown down the memory hole, so that today probably no more than one in a hundred Americans is even aware of them. Furthermore, most of these

incidents came to light due to chance circumstances, so we may easily suspect that many other attacks of a similar nature have never become part of the historical record.

Once we accept that the 9/11 attacks were probably a false-flag operation, a central clue to the likely perpetrators has been their extraordinary success in ensuring that such a wealth of enormously suspicious evidence has been totally ignored by virtually the entire American media, whether liberal or conservative, left-wing or right-wing.

The only other such extreme cases that come to my mind almost invariably involve either Jewish issues or Israel. For example, virtually no Americans are today aware of the close Nazi-Zionist economic partnership of the 1930s that played a crucial role in the establishment of the State of Israel. Similarly, although our Western media has enshrined it as one of the central events of the twentieth century, there seems a good likelihood that the Jewish Holocaust of the Second World War is either substantially or almost entirely fraudulent. Even highly successful false-flag terrorist operations will tend to leave behind a certain number of individual clues, and possessing the media power to cause that evidence to vanish from perceived reality is an extremely important tool for such operations.

In the particular case at hand, the considerable number of zealously pro-Israel Neocons situated just beneath the public surface of the Bush Administration in 2001 could have greatly facilitated both the successful organization of the attacks and their effective cover-up and concealment, with Libby, Wolfowitz, Feith, and Richard Perle being merely the most obvious names. Whether such individuals were knowing conspirators or merely had personal ties allowing them to be exploited in furthering the plot is entirely unclear.

Most of this information must surely have long been apparent to knowledgeable observers, and I strongly suspect that many individuals who had paid much greater attention than myself to the details of the 9/11 attacks may have quickly formed a tentative conclusion along these same times. But for obvious social and political reasons, there is a great reluctance to publicly point the finger of blame towards Israel on a matter of such enormous magnitude. Hence, except for a few fringe activists here and there, such dark suspicions remained private.

Meanwhile, the leaders of the 9/11 Truth movement probably feared

they would be destroyed by media accusations of deranged anti-Semitism if they had ever expressed even a hint of such ideas. This political strategy may have been necessary, but by failing to name any plausible culprit, they created a vacuum that was soon filled by "useful idiots" who shouted "inside job!" while pointing an accusing finger toward Cheney and Rumfeld, and thereby did so much to discredit the entire 9/11 Truth movement.

This unfortunate conspiracy of silence finally ended in 2009 when Dr. Alan Sabrosky, former Director of Studies at the US Army War College, stepped forward and publicly declared that the Israeli Mossad had very likely been responsible for the 9/11 attacks, writing a series of columns on the subject, and eventually presenting his views in a number of media interviews, along with additional analyses.

Obviously, such explosive charges never reached the pages of my morning *Times*, but they did receive considerable if transitory coverage in portions of the alternative media, and I remember seeing the links very prominently featured at *Antiwar.com* and widely discussed elsewhere. I had never previously heard of Sabrosky, so I consulted my archiving system and immediately discovered that he had a perfectly respectable record of publication on military affairs in mainstream foreign policy periodicals and had also held a series of academic appointments at prestigious institutions. Reading one or two of his articles on 9/11, I felt he made a rather persuasive case for Mossad involvement, with some of his information already known to me but much of it not.

Since I was very busy with my software work and had never spent any time investigating 9/11 or reading any of the books on the topic, my belief in his claims back then was obviously quite tentative. But now that I have finally looked into the topic in much greater detail and done a great deal of reading, I think it seems quite likely that his 2009 analysis was entirely correct.

I would particularly recommend his long 2011 interview on Iranian Press TV, which I first watched just a couple of days ago. He came across as highly credible and forthright in his claims:

I have had long conversations over
the last two weeks with contacts
at the Army War College and the
headquarters, Marine Corps and
I've made it absolutely clear in
both cases that it is 10
rtain
that 9/11 was a Mossa
ation
Period
The Zionists are playing this as an
all-or-nothing exercise
If they lose this one, they're done..
Alan Sabrosky
US Army War College Retired

He also provided a pugnacious conclusion in a much longer 2010 radio interview:

Sabrosky focused much of his attention upon a particular segment of a Dutch documentary film on the 9/11 attacks produced several years earlier. In that fascinating interview, a professional demolition expert named Danny Jowenko who was largely ignorant of the 9/11 attacks immediately identified the filmed collapse of WTC Building 7 as a controlled-demolition, and the remarkable clip was broadcast

worldwide on *Press TV* and widely discussed across the Internet.

And by a very strange coincidence, just three days after Jowenko's broadcast video interview had received such heavy attention, he had the misfortune to die in a frontal collision with a tree in Holland. I'd suspect that the community of professional demolition experts is a small one, and Jowenko's surviving industry colleagues may have quickly concluded that serious misfortune might visit those who rendered controversial expert opinions on the collapse of the three World Trade Center towers.

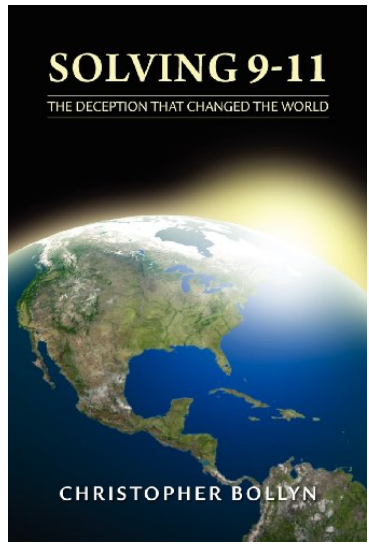
Meanwhile, the ADL soon mounted a huge and largely successful effort to have *Press TV* banned in the West for promoting "anti-Semitic conspiracy theories," even persuading YouTube to entirely eliminate the huge video archive of those past shows, notably including Sabrosky's long interview.

Most recently, Sabrosky provided an hour-long presentation at this June's Deep Truth video panel conference, during which he expressed considerable pessimism about America's political predicament, and suggested that the Zionist control over our politics and media had grown even stronger over the last decade.

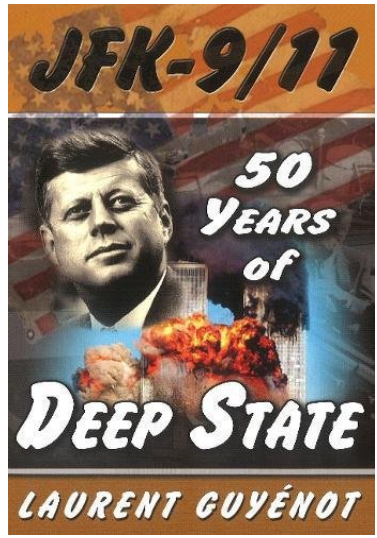
His discussion was soon rebroadcast by *Guns & Butter*, a prominent progressive radio program, which as a consequence was soon purged

from its home station after seventeen years of great national popularity and strong listener support.

The late Alan Hart, a very distinguished British broadcast journalist and foreign correspondent, also broke his silence in 2010 and similarly pointed to the Israelis as the likely culprits behind the 9/11 attacks. Those interested may wish to listen to his extended interview.

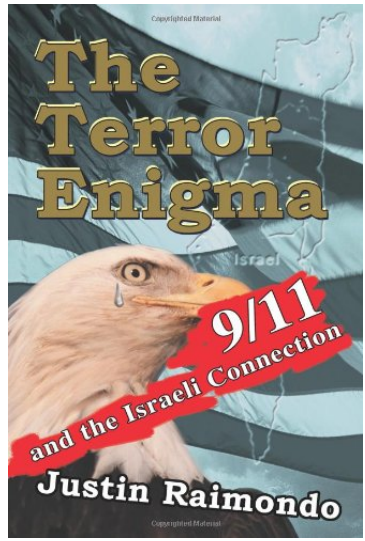


Journalist Christopher Bollyn was one of the first writers to explore the possible Israeli links to the 9/11 attacks, and the details contained in his long series of newspaper articles are often quoted by other researchers. In 2012, he gathered together this material and published it in the form of a book entitled *Solving 9-11*, thereby making his information on the possible role of the Israeli Mossad available to a much wider audience, with a version being available online. Unfortunately his printed volume severely suffers from the typical lack of resources available to the writers on the political fringe, with poor organization and frequent repetition of the same points due to its origins in a set of individual articles, and this may diminish its credibility among some readers. So those who purchase it should be forewarned about these serious stylistic weaknesses.



Probably a much better compendium of the very extensive evidence pointing to the Israeli hand behind the 9/11 attacks has been more recently provided by French writer Laurent Guyénot, both in his 2017 book *JFK-9/11: 50 Years of the Deep State* and also his 8,500 word article "9/11 was an Israeli Job", published concurrently with this one and providing a far greater wealth of detail than is contained here. While I would not necessarily endorse all of his claims and arguments, his overall analysis seems fully consistent with my own.

These writers have provided a great deal of material in support of the Israeli Mossad Hypothesis, but I would focus attention on just one important point. We would normally expect that terrorist attacks resulting in the complete destruction of three gigantic office buildings in New York City and an aerial assault on the Pentagon would be an operation of enormous size and scale, involving very considerable organizational infrastructure and manpower. In the aftermath of the attacks, the US government undertook great efforts to locate and arrest the surviving Islamic conspirators, but scarcely managed to find a single one. Apparently, they had all died in the attacks themselves or otherwise simply vanished into thin air.



But without making much effort at all, the American government did quickly round up and arrest some 200 Israeli Mossad agents, many of whom had been based in exactly the same geographical locations as the purported 19 Arab hijackers. Furthermore, NYC police arrested some of these agents while they were publicly celebrating the 9/11 attacks, and others were caught driving vans in the New York area containing explosives or their residual traces. Most of these Mossad agents refused to answer any questions, and many of those who did failed polygraph tests, but under massive political pressure all were eventually released and deported back to Israel. A couple of years ago, much of this information was very effectively presented in a short video available on YouTube.

There is another fascinating tidbit that I have very rarely seen mentioned. Just a month after the 9/11 attacks, two Israelis were caught sneaking weapons and explosives into the Mexican Parliament building, a story that naturally produced several banner-headlines in leading Mexican newspapers at the time but which was greeted by total silence in the American media. Eventually, under massive political pressure, all charges were dropped and the Israeli agents were deported back home. This remarkable incident was only reported on a small Hispanic-activist website, and discussed in a few other places. Some years ago I easily found the scanned front pages of the Mexican newspapers reporting those dramatic events on the Internet, but I can no longer easily locate them. The details are obviously somewhat fragmentary and possibly garbled, but certainly quite intriguing.

One might speculate that if supposed Islamic terrorists had followed up their 9/11 attacks by attacking and destroying the Mexican parliament building a month later, Latin American support for America's military invasions in the Middle East would have been greatly magnified. Furthermore, any scenes of such massive destruction in the Mexican capital by Arab terrorists would surely have been broadcast non-stop on *Univision*, America's dominant Spanish-language network, fully solidifying Hispanic support for President Bush's military endeavors.

Although my growing suspicions about the 9/11 attacks stretch back a decade or more, my serious investigation of the topic is quite recent, so I am certainly a newcomer to the field. But sometimes an outsider can notice things that may escape the attention of those who have spent so many years deeply immersed in a given topic.

From my perspective, a huge fraction of the 9/11 Truth community spends far too much of its time absorbed in the particular details of the attacks, debating the precise method by which the World Trade Center towers in New York were brought down or what actually struck the Pentagon. But these sorts of issues seem of little ultimate significance.

I would argue that the only important aspect of such technical issues is whether the overall evidence is sufficiently strong to establish the falsehood of the official 9/11 narrative and also demonstrate that the attacks must have been the work of a highly sophisticated organization with access to advanced military technology rather than

a rag-tag band of 19 Arabs armed with box-cutters. Beyond that, none of those details matter.

In that regard, I believe that the volume of factual material collected by determined researchers over the last seventeen years has easily met that requirement, perhaps even ten or twenty times over. For example, even agreeing upon a single particular item such as the clear presence of nano-thermite, a military-grade explosive compound, would immediately satisfy those two criteria. So I see little point in endless debates over whether nano-thermite was used, or nano-thermite plus something else, or just something else entirely. And such complex technical debates may serve to obscure the larger picture, while confusing and intimidating any casually-interested onlookers, thereby being quite counter-productive to the overall goals of the 9/11 Truth movement.

Once we have concluded that the culprits were part of a highly-sophisticated organization, we can then focus on the *Who* and the *Why*, which surely would be of greater importance than the particular details of the *How*. Yet currently all the endless debate over the *How* tends to crowd out the *Who* and the *Why*, and I wonder whether this unfortunate situation might even be intentional.

Perhaps one reason is that once sincere 9/11 Truthers do focus on those more important questions, the vast weight of the evidence clearly points in a single direction, implicating Israel and its Mossad intelligence service, with the case being overwhelmingly strong in motive, means, and opportunity. And leveling accusations of blame at Israel and its domestic collaborators for the greatest attack ever launched against America on our own soil entails enormous social and political risks.

But such difficulties must be weighed against the reality of three thousand American civilian lives and the subsequent seventeen years of our multi-trillion-dollar wars, which have produced tens of thousands of dead or wounded American servicemen and the death or displacement of many millions of innocent Middle Easterners.

The members of the 9/11 Truth movement must therefore ask themselves whether or not “Truth” is indeed the central goal of their efforts.

# The ADL in American Society

October 15, 2018 • 7,300 Words

In our modern era, there are surely few organizations that so terrify powerful Americans as the Anti-Defamation League (ADL) of B'nai B'rith, a central organ of the organized Jewish community.

Mel Gibson had long been one of the most popular stars in Hollywood and his 2004 film *The Passion of the Christ* became among the most profitable in world history, yet the ADL and its allies destroyed his career, and he eventually donated millions of dollars to Jewish groups in desperate hopes of regaining some of his public standing. When the ADL criticized a cartoon that had appeared in one of his newspapers, media titan Rupert Murdoch provided his personal apology to that organization, and the editors of *The Economist* quickly retracted a different cartoon once it came under ADL fire. Billionaire Tom Perkins, a famed Silicon Valley venture capitalist, was forced to issue a heartfelt apology after coming under ADL criticism for his choice of words in a *Wall Street Journal* column. These were all proud, powerful individuals, and they must have deeply resented being forced to seek such abject public forgiveness, but they did so nonetheless. The total list of ADL supplicants over the years is a very long one.

Given the fearsome reputation of the ADL and its notorious hair-trigger activists, there was a widespread belief that my small webzine would be completely annihilated when I first launched my recent series of controversial articles in early June by praising the works of historian David Irving, a figure long demonized by the ADL. Yet absolutely nothing happened.

During the next three months my subsequent articles directly challenged nearly every hot-button issue normally so fiercely defended by the ADL and its lackeys, so much so that a friendly journalist soon described me as the "Kamikaze from California." Yet despite my 90,000 words of text and the 13,000 comments I had attracted, the continuing silence of the ADL was absolutely deafening. Meanwhile, my articles were read more than half a million times, with the following being a list of the most provocative pieces:

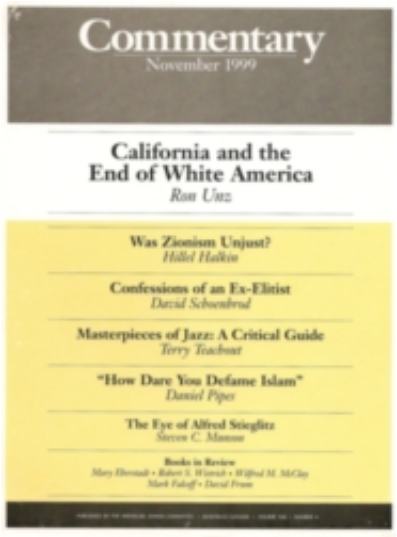
- The Remarkable Historiography of David Irving
  June 4, 2018 • 1,700 Words • 570 Comments
- American Pravda: The JFK Assassination, Part II – Who Did It?

June 25, 2018 • 8,000 Words • 985 Comments
- American Pravda: Oddities of the Jewish Religion
  July 16, 2018 • 7,800 Words • 1,637 Comments
- American Pravda: The Bolshevik Revolution and Its Aftermath
  July 23, 2018 • 6,900 Words • 913 Comments
- American Pravda: The Nature of Anti-Semitism
  July 30, 2018 • 5,500 Words • 666 Comments
- American Pravda: Jews and Nazis
  August 6, 2018 • 6,800 Words • 554 Comments
- American Pravda: Holocaust Denial
  August 27, 2018 • 17,600 Words • 2,323 Comments
- American Pravda: 9/11 Conspiracy Theories
  September 10, 2018 • 11,000 Words • 2,355 Comments

When divine wrath fails to smite the heretic and terrifying enforcers of official dogma seem to have suddenly lost their taste for battle, others gradually begin to take notice and may grow emboldened. Eventually leading pro-Russian and Libertarian websites such as *Russia Insider* and *LewRockwell* began republishing some of my most controversial American Pravda articles, thus bringing my factual claims to the attention of broader audiences. After the conclusion of my series, I began directly ridiculing my strangely timorous ADL opponents, publishing a short column entitled "Has the ADL Gone Into Hiding?" which led the redoubtable Paul Craig Roberts to describe me as "the bravest man I know."

Apparently the combination of all these factors at long last grew too worrisome for the ADL, and stirring from their secret hiding place, its activists have now finally released a short and rather milquetoast response to my material, one which hardly much impresses me. A few days ago, they Tweeted out their column, together with a photo of their new nemesis.

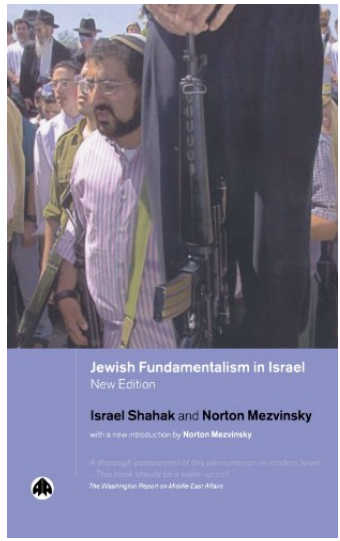
> California businessman Ron Unz has long been funding anti-Israel activists. Now, he's embracing hardcore #antiSemitism, denying the Holocaust & claiming Jews run the media & worship Satan. Learn more from our experts: https://t.co/KnngID3YCh
>
> — ADL (@ADL) October 8, 2018



The ADL may boast an annual budget of $60 million and have many hundreds of full-time employees, but its research skills seem sorely lacking. I discovered that they opened their rebuke by denouncing me as a notorious "anti-immigrant activist." This seems an extremely odd claim given that I have published perhaps a quarter-million words on that contentious topic over the last twenty-five years, nearly all of it online and fully searchable, and my views have never been characterized in that fashion. To cite just one example, my article "California and the End of White America" appeared as a 1999 cover-story in *Commentary*, the flagship publication of The American Jewish Committee, and surely anyone reading it would be greatly puzzled by the ADL's description. Indeed, just a few years earlier, I had been a top featured speaker at the October 1994 pro-immigrant protest in downtown Los Angeles, a 70,000 strong political rally that was the largest such gathering in American history to that date.

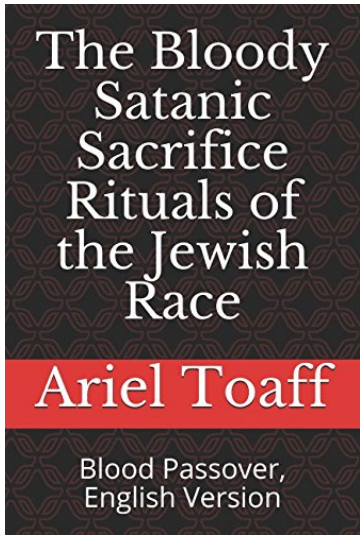
IN DEFENSE OF HOLOCAUST OBSESSION TONY JUDT
THE NEW REPUBLIC
HILLARY'S SHARPTON PROBLEM
MICHELLE COTTLE
IS CHURCH GOOD FOR YOU?
GREGG EASTERBROOK
NO ONE ELECTED HIM. HARDLY ANYONE HAS EVEN HEARD OF HIM, BUT
THIS MAN CONTROLS CALIFORNIA
MATTHEW MILLER
ON THE QUIRKY POLITICAL GENIUS OF RON UNZ

Over the years, my political activities have been the subject of many thousands of articles in the mainstream media, including a half-dozen front-page stories in the *New York Times*, and these would provide a similar picture, as did the *New Republic* cover story chronicling my California successes. Moreover, my views on immigrants haven't changed all that much over the years as demonstrated by my more recent articles such as "The Myth of Hispanic Crime," "Immigration, Republicans, and the End of White America" and "A Grand Bargain on Immigration?" Perhaps the intrepid ADL investigators should acquaint themselves with a powerful new technological tool called "Google."



Jewish Fundamentalism in Israel
New Edition
Israel Shahak and Norton Mezvinsky
with a new introduction by Norton Mezvinsky
The Washington Report on Middle East Affairs

I was equally unimpressed that they so hotly denounced me for substantially relying upon the writings of Israel Shahak, whom they characterized as viciously "anti-Semitic." As I had repeatedly emphasized, my own total lack of Aramaic and Hebrew necessarily forces me to rely upon the research of others, and the late Prof. Shahak, an award-winning Israeli academic, certainly seemed a fine source to use. After all, famed linguist Noam Chomsky had lauded Shahak's works for their "outstanding scholarship," and several of our other most prominent public intellectuals such as Christopher Hitchens, Edward Said, and Gore Vidal had been similarly lavish in their praise. Furthermore, one of Shahak's co-authors was Norton Mezvinsky, a prominent American academic specializing in Middle Eastern history, himself hardly an obscure figure given that both his brother and sister-in-law served in Congress and his nephew later married Chelsea Clinton. And as far as I'm aware almost none of Shahak's explicit claims about the Talmud or traditional Judaism have ever been directly challenged, while the online availability of his first book allows those so interested to conveniently read it and decide for themselves.



The ADL similarly denounced me for taking seriously the theories of Ariel Toaff, another Israeli academic. But Prof. Toaff, son of the Chief Rabbi of Rome, certainly ranks as one of the world's leading scholarly authorities on Medieval Jewry, and working together with his graduate students and other colleagues, he had devoted many years of effort to the research study in question, drawing upon extensive primary and secondary sources produced in eight different languages. I found his 500 page book quite persuasive, as did Israeli journalist Israel Shamir, and I have seen no credible rebuttals.

Now the work of all these prominent academics and intellectuals may not necessarily be correct, and perhaps I am mistaken in accepting their factual claims. But I would need to see something far more weighty than a casual dismissal in a few paragraphs contained within an anonymous ADL column, whose author for all I know might have been some ignorant young intern.

Those glaring flaws aside, most of the ADL's remaining catalogue of my numerous heretical positions seemed reasonably accurate, though obviously presented in a somewhat hostile and derogatory fashion and sorely lacking any links to my original pieces. But even this desultory listing of my mortal transgressions was woefully incomplete, with the ADL strangely failing to include mention of some of my most controversial claims.

For example, the authors excluded all reference to my discussion of the thoroughly documented Nazi-Zionist economic partnership of the 1930s, which played such a crucial role in laying the basis for the State of Israel. And the ADL similarly avoided mentioning the nearly 20,000 words I had allocated to discussing the very considerable evidence that the Israeli Mossad had played a central role in both the JFK Assassination and the 9/11 Attacks. Surely this must be one of the few times that the ADL has deliberately avoided leveling the charge of "conspiracy theorist" against an opponent whom they might have so easily slurred in that fashion. Perhaps they felt the evidence I provided was simply too strong for them to effectively challenge.

The worrisome incompetence of ADL researchers becomes particularly alarming when we consider that over the last couple of years that organization has been elevated into a content gatekeeping role at America's largest Internet companies, helping to determine what may or may not be said on the most important Social Media platforms such as Facebook, YouTube, and Twitter.

My local paper is the *San Jose Mercury News* and a couple of weeks ago it published a major profile interview with Brittan Heller, the ADL Director tasked with policing "hate speech" across the America-dominated portions of the Internet. She seemed like a perfectly pleasant young woman in her mid-thirties, a Stanford English major and a graduate of Yale Law, now living in Silicon Valley with her husband and her two cats, Luna and Stella. She emphasizes her own experience as a victim of cyber-harassment from a fellow college student whose romantic overtures she rejected and the later expertise she had gained as a Nazi-hunter for the U.S. government. But does that resume really provide her with the god-like knowledge suitable for overriding our traditional First Amendment rights and determining which views and which individuals should be allowed access to some two billion readers worldwide?

There is also a far more serious aspect to the situation. The choice of the ADL as the primary ideological overseer of America's Internet may seem natural and appropriate to politically-ignorant Americans, a category that unfortunately includes the technology executives leading the companies involved. But this reflects the remarkable cowardice and dishonesty of the American media from which all these individuals derive their knowledge of our world. The true recent history of the ADL is a remarkably sordid and disreputable tale.

In January 1993, the San Francisco Police Department reported that it had recently raided the Northern California headquarters of the ADL based upon information provided by the FBI. The SFPD discovered that the organization had been keeping intelligence files on more than 600 civic organizations and 10,000 individuals, overwhelmingly of a

liberal orientation, with the SFPD inspector estimating that 75% of the material had been illegally obtained, much of it by secret payments to police officials. This was merely the tip of the iceberg in what clearly amounted to the largest domestic spying operation by any private organization in American history, and according to some sources, ADL agents across the country had targeted over 1,000 political, religious, labor, and civil rights organizations, with the New York headquarters of the ADL maintaining active dossiers on more than a million Americans.

Not long afterward, an ACLU official who had previously held a high-ranking position with the ADL revealed in an interview that his organization had been the actual source of the highly controversial 1960s surveillance on Martin Luther King, Jr., which it had then provided to FBI Director J. Edgar Hoover. For many years Hoover had been furiously denounced in the national media headlines for his use of tapes and other secret information on King's activities, but when a local San Francisco newspaper revealed that an ADL spying operation had actually been the source of all that sordid material, the bombshell revelation was totally ignored in the national media and only reported by fringe organizations, so that today almost no Americans are aware of that fact.

I know of no other private organization in American history that has been involved in even a sliver of such illegal domestic espionage activity, which appears to have been directed against almost all groups and prominent individuals—left, right, and center—suspected of being insufficiently aligned with Jewish and Israeli interests. Some of the illegal material found in the ADL's possession even raised dark suspicions that it had played a role in domestic terrorist attacks and political assassinations directed against foreign leaders. I am no legal expert, but given the massive scale of such illegal ADL activities, I wonder whether a plausible case might have been made to prosecute the entire organization under RICO statutes and sentence all of its leaders to long prison terms.

Instead, the resulting government charges were quickly settled with merely a trivial fine and a legal slap on the wrist, demonstrating the near-total impunity provided by massive Jewish political power in modern American society.

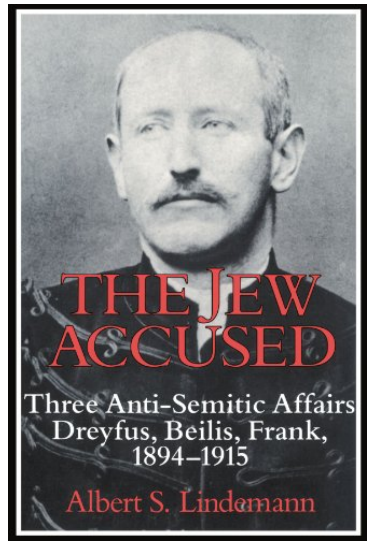
In effect, the ADL seems to have long operated as a privatized version of our country's secret political police, monitoring and enforcing its ideological doctrines on behalf of Jewish groups much as the Stasi did for the Communist rulers of East Germany. Given such a long history

of criminal activity, allowing the ADL to extend its oversight to our largest Social Media platforms amounts to appointing the Mafia to supervise the FBI and the NSA, or taking a very large step towards implementing George Orwell's " Ministry of Truth" on behalf of Jewish interests.

In his 1981 memoirs, the far right Classics scholar Revilo P. Oliver characterized the ADL as "the formidable organization of Jewish cowboys who ride herd on their American cattle" and this seems a reasonably apt description to me.

Although I had long recognized the power and influence of the ADL, a leading Jewish-activist organization whose leaders were so regularly quoted in my newspapers, until rather recently I had only the vaguest notions of its origins. I'm sure I'd heard the story mentioned at some point, but the account had never stuck in my mind.

Then perhaps a year or two ago, I happened to come across some discussion of the ADL's 2013 centenary celebration, in which the leadership reaffirmed the principles of its 1913 founding. The initial impetus had been the vain national effort to save the life of Leo Frank, a young Southern Jew unjustly accused of murder and eventually lynched. Not long before, Frank's name and story would have been equally vague in my mind, only half-remembered from my introductory history textbooks as one of the most notable early KKK victims in the fiercely anti-Semitic Deep South of the early twentieth century. However, not long before seeing that piece on the ADL I'd read Albert Lindemann's highly-regarded study *The Jew Accused*, and his short chapter on the notorious Frank case had completely exploded all my preconceptions.



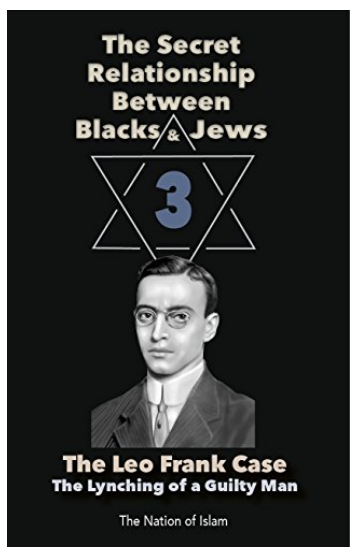
First, Lindemann demonstrated that there was no evidence of any anti-Semitism behind Frank's arrest and conviction, with Jews constituting a highly-valued element of the affluent Atlanta society of the day, and no references to Frank's Jewish background, negative or otherwise, appearing in the media prior to the trial. Indeed, five of the Grand Jurors who voted to indict Frank for murder were themselves Jewish, and none of them ever voiced regret over their decision. In general, support for Frank seems to have been strongest among Jews from New York and other distant parts of the country and weakest among the Atlanta Jews with best knowledge of the local situation.

Furthermore, although Lindemann followed the secondary sources he relied upon in declaring that Frank was clearly innocent of the charges of rape and murder, the facts he recounted led me to the opposite conclusion, seeming to suggest strong evidence of Frank's guilt. When I much more recently read Lindemann's longer and more comprehensive historical study of anti-Semitism, *Esau's Tears*, I noticed that his abbreviated treatment of the Frank case no longer made any such claim of innocence, perhaps indicating that the author himself might have also had second thoughts about the weight of the evidence.

Based on this material, I voiced that opinion in my recent article on historical anti-Semitism, but my conclusions were necessarily quite tentative since they relied upon Lindermann's summary of the information provided in the secondary sources he had used, and I had the impression that virtually all those who had closely investigated the Frank case had concluded that Frank was innocent. But after my piece

appeared, someone pointed me to a 2016 book from an unexpected source arguing for Frank's guilt. Now that I have ordered and read that volume, my understanding of the Frank case and its historical significance has been entirely transformed.

Mainstream publishers may often reject books that too sharply conflict with reigning dogma and sales of such works are unlikely to justify the extensive research required to produce the manuscript. Furthermore, both authors and publishers may face widespread vilification from a hostile media for taking such positions. For these reasons, those who publish such controversial material will often be acting from deep ideological motives rather than merely seeking professional advancement or monetary gain. As an example, it took a zealous Trotskyite leftist such as Lenni Brenner to brave the risk of ferocious attacks and invest the time and effort to produce his remarkable study of the crucial Nazi-Zionist partnership of the 1930s. And for similar reasons, we should not be totally surprised that the leading book arguing for the guilt of Leo Frank appeared as a volume in the series on the pernicious aspects of Jewish-Black historical relations produced by Louis Farrakhan's Nation of Islam (NOI), nor that the text lacked any identified author.



Anonymous works published by heavily-demonized religious-political movements naturally engender considerable caution, but once I began reading the 500 pages of *The Leo Frank Case: The Lynching of a Guilty Man* I was tremendously impressed by the quality of the historical analysis. I think I have only very rarely encountered a research monograph on a controversial historical event that provided such an

enormous wealth of carefully-argued analysis backed by such copious evidence. The authors seemed to display complete mastery of the major secondary literature of the last one hundred years while drawing very heavily upon the various primary sources, including court records, personal correspondence, and contemporaneous publications, with the overwhelming majority of the 1200 footnotes referencing newspaper and magazine articles of that era. The case they made for Frank's guilt seemed absolutely overwhelming.

The basic outline of events is not disputed. In 1913 Georgia, a 13-year-old pencil company worker named Mary Phagan was last seen alive visiting the office of factory manager Leo Frank on a Saturday morning to collect her weekly paycheck, while her raped and murdered body was found in the basement early the next morning and Frank eventually arrested for the crime. As the wealthy young president of the Atlanta chapter of B'nai B'rith, Frank ranked as one of the most prominent Jewish men in the South, and great resources were deployed in his legal defense, but after the longest and most expensive trial in state history, he was quickly convicted and sentenced to death.

The facts of the case against Frank eventually became a remarkable tangle of complex and often conflicting evidence and eyewitness testimony, with sworn statements regularly being retracted and then counter-retracted. But the crucial point that the NOI authors emphasize for properly deciphering this confusing situation is the enormous scale of the financial resources that were deployed on Frank's behalf, both prior to the trial and afterward, with virtually all of the funds coming from Jewish sources. Currency conversions are hardly precise, but relative to the American family incomes of the time, the total expenditures by Frank supporters may have been as high as $25 million in present-day dollars, quite possibly more than any other homicide defense in American history before or after, and an almost unimaginable sum for the impoverished Deep South of that period. Years later, a leading donor privately admitted that much of this money was spent on perjury and similar falsifications, something which is very readily apparent to anyone who closely studies the case. When we consider this vast ocean of pro-Frank funding and the sordid means for which it was often deployed, the details of the case become far less mysterious. There exists a mountain of demonstrably fabricated evidence and false testimony in favor of Frank, and no sign of anything similar on the other side.

The police initially suspected the black night watchman who found the girl's body, and he was quickly arrested and harshly interrogated. Soon afterward, a bloody shirt was found at his home, and Frank made several statements that seemed to implicate his employee in the crime. At one point, this black suspect may have come close to being summarily lynched by a mob, which would have closed the case. But he stuck to his story of innocence with remarkable composure, in sharp contrast to Frank's extremely nervous and suspicious behavior, and the police soon shifted their scrutiny toward the latter, culminating in his arrest. All researchers now recognize that the night watchman was entirely innocent, and the evidence against him planted.

The case against Frank steadily mounted. He was the last man known to have seen the young victim and he repeatedly changed important aspects of his story. Numerous former female employees reported his long history of sexually aggressive behavior toward them, especially directed towards the murdered girl herself. At the time of the murder, Frank claimed to have been working alone in his office, but a witness who went there reported he had been nowhere to be found. A vast amount of circumstantial evidence implicated Frank.

A black Frank family servant soon came forward with sworn testimony that Frank had confessed the murder to his wife on the morning after the killing, and this claim seemed supported by the latter's strange refusal to visit her husband in jail for the first two weeks after the day of his arrest.

Two separate firms of experienced private detectives were hired by Frank's lavishly-funded partisans, and the agents of both eventually came to the reluctant conclusion that Frank was guilty as charged.

As the investigation moved forward, a major break occurred as a certain Jim Conley, Frank's black janitor, came forward and confessed to having been Frank's accomplice in concealing the crime. At the trial he testified that Frank had regularly enlisted him as a lookout during his numerous sexual liaisons with his female employees, and after murdering Phagan, Frank had then offered him a huge sum of money to help remove and hide the body in the basement so that the crime could be pinned upon someone else. But with the legal noose tightening around Frank, Conley had begun to fear that he might be made the new scapegoat, and went to the authorities in order to save his own neck. Despite Conley's damning accusations, Frank repeatedly refused to confront him in the presence of the police, which was widely seen as further proof of Frank's guilt.

By the time of the trial itself, all sides were agreed that the murderer was either Frank, the wealthy Jewish businessman, or Conley, the semi-literate black janitor with a first-grade education and a long history of public drunkenness and petty crime. Frank's lawyers exploited this comparison to the fullest, emphasizing Frank's Jewish background as evidence for his innocence and indulging in the crudest sort of racial invective against his black accuser, whom they claimed was obviously the true rapist and murderer due to his bestial nature.

Those attorneys were the best that money could buy and the lead counsel was known as the one of the most skilled courtroom interrogators in the South. But although he subjected Conley to a grueling sixteen hours of intense cross-examination over three days, the latter never wavered in the major details of his extremely vivid story, which deeply impressed the local media and the jury. Meanwhile, Frank refused to take the stand at his own trial, thereby avoiding any public cross-examination of his often changing account.

Two notes written in crude black English had been discovered alongside Phagan's body, and everyone soon agreed that these were written by the murderer in hopes of misdirecting suspicion. So they were either written by a semi-literate black such as Conley or by an educated white attempting to imitate that style, and to my mind, the spelling and choice of words strongly suggests the latter, thereby implicating Frank.

Taking a broader overview, the theory advanced by Frank's legion of posthumous advocates seems to defy rationality. These journalists and scholars uniformly argue that Conley, a semi-literate black menial, had brutally raped and murdered a young white girl, and the legal authorities soon became aware of this fact, but conspired to set him free by supporting a complex and risky scheme to instead frame an innocent white businessman. Can we really believe that the police officials and prosecutors of a city in the Old South would have violated their oath of office in order to knowingly protect a black rapist and killer from legal punishment and thereby turn him loose upon their city streets, presumably to prey on future young white girls? This implausible reconstruction is particularly bizarre in that nearly all its advocates across the decades have been the staunchest of Jewish liberals, who have endlessly condemned the horrific racism of the Southern authorities of that era, but then unaccountably chose to make a special exception in this one particular case.

In many respects, the more important part of the Frank case began after his conviction and death sentence when many of America's wealthiest and most influential Jewish leaders began mobilizing to save him from the hangman. They soon established the ADL as a new vehicle for that purpose and succeeded in making the Frank murder case one of the most famous in American history to that date.

Although his role was largely concealed at the time, the most important new backer whom Frank attracted was Albert Lasker of Chicago, the unchallenged monarch of American consumer advertising, which constituted the life's blood of all of our mainstream newspapers and magazines. Not only did he ultimately provide the lion's share of the funds for Frank's defense, but he focused his energies upon shaping the media coverage surrounding the case. Given his dominant business influence in that sector, we should not be surprised that a huge wave of unremitting pro-Frank propaganda soon began appearing across the country in both local and national publications, extending to most of America's most popular and highly-regarded media outlets, with scarcely a single word told on the other side of the story. This even included all of Atlanta's own leading newspapers, which suddenly reversed their previous positions and became convinced of Frank's innocence.

Lasker also enlisted other powerful Jewish figures in the Frank cause, including *New York Times* owner Adolph Ochs, *American Jewish Committee* president Louis Marshall, and leading Wall Street financier Jacob Schiff. The *Times*, in particular, began devoting enormous coverage to this previously-obscure Georgia murder case, and many of its articles were widely republished elsewhere. The NOI authors highlight this extraordinary national media attention: "The Black janitor whose testimony became central to Leo Frank's conviction became the most quoted Black person in American history up to that time. More of his words appeared in print in the *New York Times* than those of W.E.B. Du Bois, Marcus Garvey, and Booker T. Washington—*combined.*"

Back a century ago just as today, our media creates our reality, and with Frank's innocence being proclaimed nationwide in near-unanimous fashion, a long list of prominent public figures were soon persuaded to demand a new trial for the convicted murderer, including Thomas Edison, Henry Ford, and Jane Addams.

Ironically enough, Lasker himself plunged into this crusade despite apparently having very mixed personal feelings about the man whose cause he was championing. His later biography reveals that upon his

first personal meeting with Frank, he perceived him as “a pervert” and a “disgusting” individual, so much so that he even hoped that after he managed to free Frank, the latter would quickly perish in some accident. Furthermore, in his private correspondence he freely admitted that a large fraction of the massive funding that he and numerous other wealthy Jews from across the country were providing had been spent on perjured testimony and there are also strong hints that he explored bribing various judges. Given these facts, Lasker and Frank’s other major backers were clearly guilty of serious felonies, and could have received lengthy prison terms for their illegal conduct.

With the *New York Times* and the rest of the liberal Northern media now providing such heavy coverage of the case, Frank’s defense team was forced to abandon the racially-inflammatory rhetoric aimed at his black accuser which had previously been the centerpiece of their trial strategy. Instead, they began concocting a tale of rampant local anti-Semitism, previously unnoticed by all observers, and adopted it as a major grounds for their appeal of the verdict.

The unprincipled legal methods pursued by Frank’s backers is illustrated by a single example. Georgia law normally required that a defendant be present in court to hear the reading of the verdict, but given the popular emotions in the case, the judge suggested that this provision be waived, and the prosecution assented only if the defense lawyers promised not to use this small irregularity as grounds for appeal. But after Frank was convicted, AJC President Marshall and his other backers orchestrated numerous unsuccessful state and federal appeals on exactly this minor technicality, merely hiring other lawyers to file the motions.

For almost two years, the nearly limitless funds deployed by Frank’s supporters covered the costs of thirteen separate appeals on the state and federal levels, including to the U.S. Supreme Court, while the national media was used to endlessly vilify Georgia’s system of justice in the harshest possible terms. Naturally, this soon generated a local reaction, and during this period outraged Georgians began denouncing the wealthy Jews who were spending such enormous sums to subvert the local criminal justice system.

One of the very few journalists willing to oppose Frank’s position was Georgia publisher Tom Watson, a populist firebrand, and in an editorial he reasonably declared “We cannot have…one law for the Jew, and another for the Gentile” while he also later lamented that “It is a bad state of affairs when the idea gets abroad that the law is too weak to punish a man who has plenty of money.” A former Georgia

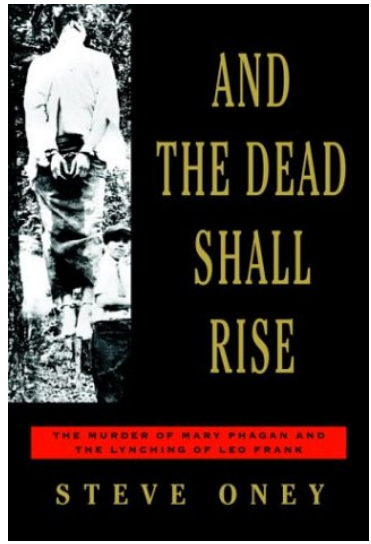
governor indignantly inquired “Are we to understand that anybody except a Jew can be punished for a crime.” The clear facts indicate that there was indeed a massive miscarriage of justice in Frank’s case, but virtually all of it occurred in Frank’s favor.

All appeals were ultimately rejected and Frank’s execution date for the rape and murder of the young girl finally drew near. But just days before he was scheduled to leave office, Georgia’s outgoing governor commuted Frank’s sentence, provoking an enormous storm of popular protest, especially since he was the business partner of Frank’s chief defense lawyer, an obvious conflict of interest. Given the enormous funds that Frank’s national supporters had been deploying on his behalf and the widespread past admissions of bribery in the case, there are obviously dark suspicions about what had prompted such a remarkably unpopular decision, which soon forced the former governor to exile himself from the state. A few weeks later, a group of Georgia citizens stormed Frank’s prison farm, abducting and hanging him, with Frank becoming the first and only Jew lynched in American history.

Naturally, Frank’s killing was roundly denounced in the national media that had long promoted his cause. But even in those quarters, there may have been a significant difference between public and private sentiments. No newspaper in the country had more strongly championed Frank’s innocence than the *New York Times* of Adolph Ochs. Yet according to the personal diary of one of the *Times* editors, Ochs privately despised Frank, and perhaps even greeted his lynching with a sense of relief. No effort was ever made by Frank’s wealthy supporters to bring any of the lynching party to justice.

Although I have now come to regard the NOI volume as the most persuasive and definitive text on the Frank case, I naturally considered conflicting works before reaching this conclusion.

For nearly a half-century, the leading scholarly account of the incident had probably been Leonard Dinnerstein's book *The Leo Frank Case*, first published in 1966, and Dinnerstein, a University of Arizona professor specializing in Jewish history, entirely supported Frank's innocence. But although the work won a national award, carries glowing blurbs from several prestigious publications, and has surely graced the reading lists of endless college courses, I was not at all impressed. Among other things, the book appears to be the original source of some of the most lurid examples of alleged anti-Semitic public outbursts that apparently have no basis in reality and seem to have been simply fabricated by the author given his lack of any citations; the NOI authors note these stories have been quietly abandoned by all recent researchers. Even leaving aside such likely falsifications, which were widely cited by later writers and heavily contaminated the historical record, I found the short Dinnerstein work rather paltry and even pitiful when compared to that of its NOI counterpart.



A far longer and more substantial recent work was Steve Oney's 2003 *And the Dead Shall Rise*, which runs nearly 750 pages and won the National Jewish Book Award, the Southern Book Critics Circle Prize, and the American Bar Association's Silver Gavel, probably establishing itself as today's canonical text on the historical incident. Oney had been a longtime Atlanta journalist and I was favorably impressed by his narrative skill, along with the numerous fascinating vignettes he provided to illustrate the Southern history of that general era. He also seemed a cautious researcher, drawing heavily upon the primary sources and avoiding much of the falsified history of the last century, while not entirely suppressing the massive evidence of bribery and perjury employed by the Frank forces.

But although Oney does mention much of this information, he strangely fails to connect the dots. For example, although he occasionally mentions some of the funds spent on Frank's behalf, he never attempts to convert them into present-day equivalents, leaving a naive reader to assume that such trivial amounts could not possibly have been used to pervert the course of justice. Furthermore, his entire book is written in chronological narrative form, with no footnotes provided in the text, and a large portion of the content being entirely extraneous to any attempt to determine Frank's guilt or innocence, contrasting very sharply with the more scholarly style of the NOI authors.

To my mind, a central element of the Frank case was the massive financial temptations being offered by Frank's Jewish backers, and the huge number of Atlanta citizens, both high and low, who apparently

shifted their positions on Frank's guilt in eager hopes of capturing some of that largess. But although this obvious theme was heavily emphasized in the NOI book, Oney seems to mostly avoid this obvious factor, perhaps even for personal reasons. Print publications have suffered massive cutbacks in recent years and I noticed on the book flap that although Oney is described as a longtime Atlanta journalist, he had subsequently relocated to Los Angeles. Once I checked, I immediately discovered that Oney's book had became the basis for an independent film entitled *The People v. Leo Frank*, and I wonder whether his hopes of capturing a sliver of Hollywood's vast lucre may not have encouraged him to so strongly suggest Frank's innocence. Would an account of Leo Frank as rapist and murderer ever be likely to reach the silver screen? The quiet influence of financial considerations is no different today than it was a century ago, and this factor must be taken into account when evaluating historical events.

The NOI authors devote nearly all of their lengthy book to a careful analysis of the Frank case provided in suitably dispassionate form, but a sense of their justifiable outrage does occasionally poke through. In the years prior to Frank's killing, many thousands of black men throughout the South had been lynched, often based on a slender thread of suspicion, with few of these incidents receiving more than a few sentences of coverage in a local newspaper, and large numbers of whites had also perished under similar circumstances. Meanwhile, Frank had received benefit of the longest trial in modern Southern history, backed by the finest trial lawyers that money could buy, and based on overwhelming evidence had been sentenced to death for the rape and murder of a young girl. But when Frank's legal verdict was carried out by extra-judicial means, he immediately became the most famous lynching victim in American history, perhaps even attracting more media attention than all those thousands of other cases combined. Jewish money and Jewish media established him as a Jewish martyr who thereby effectively usurped the victimhood of the enormous number of innocent blacks who were killed both before and after him, none of whom were ever even recognized as individuals.

As Prof. Shahak has effectively demonstrated, traditional Talmudic Judaism regarded all non-Jews as being sub-human, with their lives possessing no value. Given that Frank's backers were followers of Reform Judaism, it seems quite unlikely that they accepted this doctrine or were even aware of its existence. But religious traditions of a thousand years standing can easily become embedded within a culture, and such unrecognized cultural sentiments may have easily

shaped their reaction to Frank's legal predicament.

Influential historical accounts of the Frank case and its aftermath have contained lurid tales of the rampant public anti-Semitism visited upon Atlanta's Jewish community in the wake of the trial, even claiming that a substantial portion of the population was forced to flee as a consequence. However, a careful examination of the primary source evidence, including the contemporaneous newspaper coverage, provides absolutely no evidence of this, and it appears to be entirely fictional.

The NOI authors note that prior to Frank's trial American history had been virtually devoid of any evidence of significant anti-Semitism, with the previous most notable incident being the case of an extremely wealthy Jewish financier who was refused service at a fancy resort hotel. But by totally distorting the Frank case and focusing such massive national media coverage on his plight, Jewish leaders around the country succeeded in fabricating a powerful ideological narrative despite its lack of reality, perhaps intending the story to serve as a bonding experience to foster Jewish community cohesion.

As a further example of the widely promoted but apparently fraudulent history, the Jewish writers who have overwhelmingly dominated accounts of the Frank case have frequently claimed that it sparked the revival of the Ku Klux Klan soon afterward, with the group of citizens responsible for Frank's 1915 lynching supposedly serving as the inspiration for William Simmons' reestablishment of that organization a couple of years later. But there seems no evidence for this. Indeed, Simmons strongly emphasized the philo-Semitic nature of his new organization, which attracted considerable Jewish membership.

The primary factor behind the rebirth of the KKK was almost certainly the 1917 release of D.W. Griffith's overwhelmingly popular landmark film *Birth of a Nation*, which glorified the Klan of the Reconstruction Era. Given that the American film industry was so overwhelmingly Jewish at the time and the film's financial backers and leading Southern distributors came from that same background, it could be plausibly argued that the Jewish contribution to the creation of the 1920s Klan was a very crucial one, while the revenue from the film's distribution throughout the South actually financed Samuel Goldwyn's creation of MGM, Hollywood's leading studio.

In their introduction, the NOI authors make the fascinating point that the larger historical meaning of the Frank case in American racial

history has been entirely lost. Prior to that trial, it was unprecedented for Southern courts to allow black testimony against a white man, let alone against a wealthy man being tried on serious charges; but the horrific nature of the crime and Conley's role as the sole witness required a break from that longstanding tradition. Thus, the authors not unreasonably argued that the Frank case may have been as important to the history of black progress in America as such landmark legal verdicts as *Plessy v. Ferguson* or *Brown v. Board*. But since almost the entire historical narrative has been produced by fervent Jewish advocates, these facts have been completely obscured and the case entirely misrepresented as an example of anti-Semitic persecution and public murder.

Let us summarize what seems to be the solidly established factual history of the Frank case, quite different than the traditional narrative. There is not the slightest evidence that Frank's Jewish background was a factor behind his arrest and conviction, nor the death sentence he received. The case set a remarkable precedent in Southern courtroom history with the testimony of a black man playing a central role in a white man's conviction. From the earliest stages of the murder investigation, Frank and his allies continually attempted to implicate a series of different innocent blacks by planting false evidence and using bribes to solicit perjured testimony, while the exceptionally harsh racial rhetoric that Frank and his attorneys directed towards those blacks was presumably intended to provoke their public lynching. Yet despite all these attempts by the Frank forces to play upon the notorious racial sentiments of the white Southerners of that era, the latter saw through these schemes and Frank was the one sentenced to hang for his rape and murder of that young girl.

Now suppose that all the facts of this famous case were exactly unchanged except that Frank had been a white Gentile. Surely the trial would be ranked as one of the greatest racial turning points in American history, perhaps even overshadowing *Brown v. Board* because of the extent of popular sentiment, and it would have been given a central place in all our modern textbooks. Meanwhile, Frank, his lawyers, and his heavy financial backers would probably be cast as among the vilest racial villains in all of American history for their repeated attempts to foment the lynching of various innocent blacks so that a wealthy white rapist and murderer could walk free. But because Frank was Jewish rather than Christian, this remarkable history has been completely inverted for over one hundred years by our Jewish-dominated media and historiography.

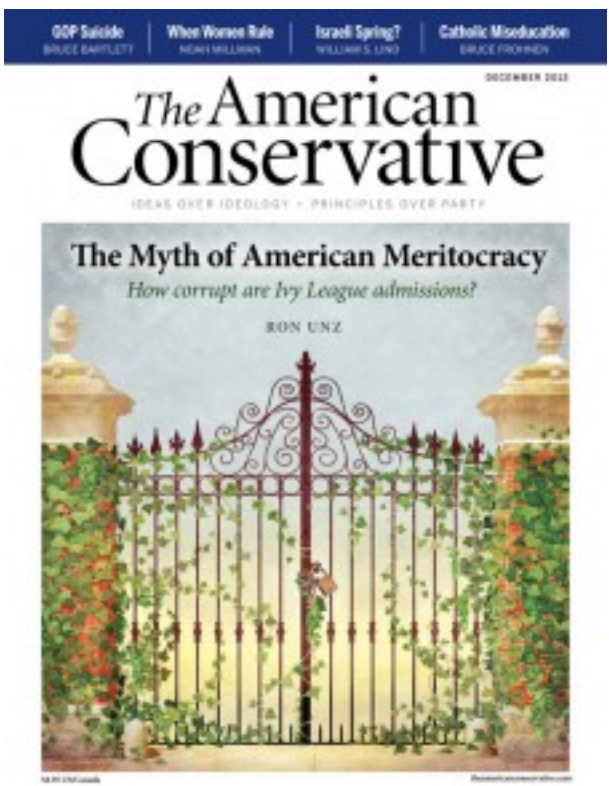
These are the important consequences that derive from control of the narrative and the flow of information, which allows murderers to be transmuted into martyrs and villains into heroes. The ADL was founded just over a century ago with the central goal of preventing a Jewish rapist and killer from being held legally accountable for his crimes, and over the decades, it eventually metastasized into a secret political police force not entirely dissimilar from the widely despised East German Stasi, but with its central goal seeming to be the maintenance of overwhelming Jewish control in a society that is 98% non-Jewish.

We should ask ourselves whether it is appropriate for an organization with such origins and such recent history to be granted enormous influence over the distribution of information across our Internet.

# Racial Discrimination at Harvard

October 22, 2018 • 10,300 Words

This last week trial began in Boston federal court for the current lawsuit in which a collection of Asian-American organizations are charging Harvard University with racial discrimination in its college admissions policies. *The New York Times*, our national newspaper of record, has been providing almost daily coverage to developments in the case, with the stories sometimes reaching the front page.



Last Sunday, just before the legal proceedings began, the *Times* ran a major article explaining the general background of the controversy, and I was very pleased to see that my own past research was cited as an important factor sparking the lawsuit, with the reporter even including a direct link to my 26,000 word 2012 cover-story "The Myth of American Meritocracy," which had provided strong quantitative evidence of anti-Asian racial quotas. Economic historian Niall Ferguson, long one of Harvard's most prominent professors but

recently decamped to Stanford, similarly noted the role of my research in his column for the *London Sunday Times*.

Two decades ago, I had published a widely-discussed op-ed in *The Wall Street Journal* on somewhat similar issues of racial discrimination in elite admissions. But my more recent article was far longer and more comprehensive, and certainly drew more attention than anything else I have ever published, before or after. Soon after it appeared in *The American Conservative*, its hundreds of thousands of pageviews broke all records for that publication and it attracted considerable notice in the media. *Times* columnist David Brooks soon ranked it as perhaps the best American magazine article of the year, a verdict seconded by a top editor at *The Economist*, and the *Times* itself quickly organized a symposium on the topic of Asian Quotas, in which I eagerly participated. *Forbes*, *The Atlantic*, *The Washington Monthly*, *Business Insider*, and other publications all discussed my striking results.

Conservative circles took considerable interest, with Charles Murray highlighting my findings, and *National Review* later publishing an article in which I explained the important implications of my findings for the legal validity of the 1978 *Bakke* decision by the U.S. Supreme Court.

There was also a considerable reaction from the academic community itself. I quickly received speaking invitations from the Yale Political Union, Yale Law, and the University of Chicago Law School, while Prof. Ferguson discussed my distressing analysis in a lengthy *Newsweek/Daily Beast* entitled "The End of the American Dream."

Moreover, I had also published an associated critique suggesting that over the years my beloved Harvard *alma mater* had transformed itself into one of the world's largest hedge-funds with a vestigial school attached for tax-exempt purposes. This also generated enormous discussion in media circles, with liberal journalist Chris Hayes Tweeting it out and generously saying he was "very jealous" he hadn't written the piece himself, while many of his colleagues promoted the piece with similarly favorable remarks, while the university quickly provided a weak public response to these serious financial charges.

Meanwhile, unbeknownst to myself or other outside observers, Harvard itself launched an internal investigation of the anti-Asian bias that I had alleged. Apparently, the university's own initial results generally confirmed my accusations, indicating that if students were

admitted solely based upon objective academic merit, far more Asians would receive thick envelopes. But Harvard's top administrators buried the study and did nothing, with these important facts only coming out years later during the discovery process of the current Asian Quotas lawsuit.

Only the first part of my very long article dealt with the question of anti-Asian racial discrimination in elite college admissions, but it attracted vastly more attention than any other element.

For many years, there had been a widespread belief within the Asian-American community that such discriminatory practices existed, a sentiment backed by considerable anecdotal evidence. But the university administrations had always flatly denied those claims, and the media had shown little interest in investigating them. However, my powerful new quantitative evidence was very difficult to ignore.

Among other things, I focused upon the publicly available statewide lists of National Merit Semifinalists (NMS), a group that constituted the highest-performing one-half percent of American high school seniors. By a fortunate coincidence, this fraction of the American student body was reasonably close in size to the total enrollment of students at the Ivy League schools together with similarly elite schools such as Stanford, Caltech, and MIT. The NMS dataset had previously been almost entirely ignored by researchers, but I found it a treasure-trove of useful empirical information.

Since Asian last names are extremely distinctive, I was able to estimate that Asians nationally constituted roughly 25-30% of this top academic group, a figure considerably larger than their enrollment at Harvard and other elite schools. This conclusion was supported by the even greater Asian dominance in more highly selective academic competitions such as the Math Olympiad and the Intel Science Talent Search, though the far smaller numbers involved reduced the statistical validity of that analysis.

But my most dramatic finding relied upon an even simpler analysis of public data, which had previously remained unnoticed. As I wrote in my *New York Times* column:

> Just as their predecessors of the 1920s always denied the existence of ﷺJewish quotas,ﷺ top officials at Harvard, Yale, Princeton and the other Ivy League schools today strongly deny

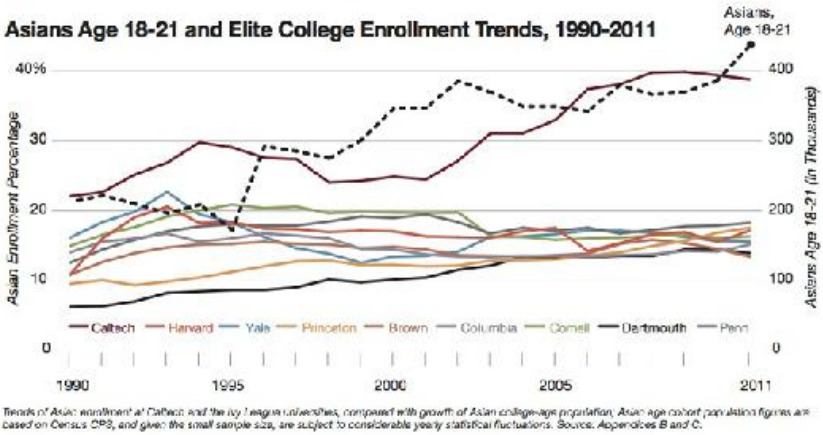
the existence of "Asian quotas." But there exists powerful statistical evidence to the contrary.

Each year, American universities provide their racial enrollment data to the National Center for Education Statistics, which makes this information available online. After the Justice Department closed an investigation in the early 1990s into charges that Harvard University discriminated against Asian-American applicants, Harvard's reported enrollment of Asian-Americans began gradually declining, falling from 20.6 percent in 1993 to about 16.5 percent over most of the last decade.

This decline might seem small. But these same years brought a huge increase in America's college-age Asian population, which roughly doubled between 1992 and 2011, while non-Hispanic white numbers remained almost unchanged. Thus, according to official statistics, the percentage of Asian-Americans enrolled at Harvard fell by more than 50 percent over the last two decades, while the percentage of whites changed little. This decline in relative Asian-American enrollment was actually larger than the impact of Harvard's 1925 Jewish quota, which reduced Jewish freshmen from 27.6 percent to 15 percent.

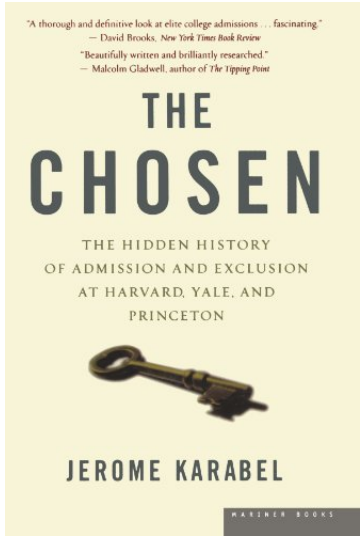
The percentages of college-age Asian-Americans enrolled at most of the other Ivy League schools also fell during this same period, and over the last few years Asian enrollments across these different universities have converged to a very similar level and remained static over time. This raises suspicions of a joint Ivy League policy to restrict Asian-American numbers to a particular percentage.

This statistical finding was illustrated in a simple graph, demonstrating that over the last two decades enrollment of Asian-Americans had gradually converged across the entire Ivy League, while sharply diverging from the rapidly increasing Asian-American population, with only strictly meritocratic Caltech continuing to track the latter.



Trends in Asian enrollment at Caltech and the Ivy League universities, compared with growth of Asian college-age population. Asian age cohort population figures are based on Census CPS, and given the small sample size, are subject to considerable yearly statistical fluctuations. Source: Appendices B and C.

It would be difficult to imagine more obvious visual evidence of an Asian Quota implemented across the Ivy League, and this chart was very widely circulated among Asian-American organizations and activists, who launched their lawsuit the following year. If they do succeed in winning their current case in federal court, the history books may eventually record that the wealthiest and most powerful university in the world was brought low by a single striking graph.



"A thorough and definitive look at elite college admissions . . . fascinating."

THE HIDDEN HISTORY
OF ADMISSION AND EXCLUSION
AT HARVARD, YALE, AND
PRINCETON
JEROME KARABEL
MARINER BOOKS

For decades Affirmative Action based upon race has been an extremely contentious topic in American politics, sharply dividing across ideological lines, and it was hardly surprising that my new analysis of that issue produced a wave of coverage. But buried deeper within that same article were even more explosive findings, apparently far too sensitive to even become a subject of significant media scrutiny.

Not without reason, most journalists regard matters touching upon Jewish sensitivities as the lethal "third rail" of their profession, and the bulk of my piece had presented some unexpected new insights in this area. These attracted the widespread private fascination of numerous prominent scholars and members of the media, but almost none of these individuals was willing to publicly disclose the results that had drawn their rapt attention.

As a consequence, these findings have remained largely unnoticed except among those who have actually taken the time to read far into my extremely long piece, while never penetrating into the awareness of the broader public. For example, Prof. Jordan Peterson, a leading celebrity-intellectual with a large YouTube following, recently demonstrated that he was totally ignorant of these important facts. Therefore, I am now taking this opportunity to summarize and excerpt those elements of my Meritocracy analysis that attracted the greatest private interest but received the least public attention.

A few years earlier, Jerome Karabel, an eminent Berkeley sociologist, had published *The Chosen*, his magisterial history of Jewish enrollment in the Ivy League, which won numerous scholarly accolades. His

research conclusively demonstrated the existence of the once-denied Jewish Quotas of the past, employed by the reigning WASP elites to maintain control of those institutions against their upstart ethnic competitors. As I wrote:

> Karabel's massive documentation—over 700 pages and 3000 endnotes—establishes the remarkable fact that America's uniquely complex and subjective system of academic admissions actually arose as a means of covert ethnic tribal warfare…
>
> As Karabel repeatedly demonstrates, the major changes in admissions policy which later followed were usually determined by factors of raw political power and the balance of contending forces rather than any idealistic considerations. For example, in the aftermath of World War II, Jewish organizations and their allies mobilized their political and media resources to pressure the universities into increasing their ethnic enrollment by modifying the weight assigned to various academic and non-academic factors, raising the importance of the former over the latter. Then a decade or two later, this exact process was repeated in the opposite direction, as the early 1960s saw black activists and their liberal political allies pressure universities to bring their racial minority enrollments into closer alignment with America's national population by partially shifting away from their recently enshrined focus on purely academic considerations. Indeed, Karabel notes that the most sudden and extreme increase in minority enrollment took place at Yale in the years 1968–69, and was largely due to fears of race riots in heavily black New Haven, which surrounded the campus.
>
> Philosophical consistency appears notably absent in many of the prominent figures involved in these admissions battles, with both liberals and conservatives sometimes favoring academic merit and sometimes non-academic factors, whichever would produce the particular ethnic student mix they desired for personal or ideological reasons. Different political blocs waged long battles for control of particular universities, and sudden large shifts in admissions rates occurred as these groups gained or lost influence within the university apparatus: Yale replaced its admissions staff in 1965 and the following year Jewish numbers nearly doubled.

Branches of Hillel, the Jewish student organization, exist across most college campuses, and for decades they have provided estimates of the percentages of the local Jewish enrollment, with Karabel and other scholars relying upon these to chart the ebbs and flows of Jewish

numbers. I discussed how Karabel used this data to celebrate the final meritocratic victory of Jewish college applicants over their former WASP oppressors.

> Indeed, Karabel opens the final chapter of his book by…noting the extreme irony that the WASP demographic group which had once so completely dominated America's elite universities and virtually all the major institutions of American life had by 2000 become a small and beleaguered minority at Harvard, being actually fewer in number than the Jews whose presence they had once sought to restrict. Very similar results seem to apply all across the Ivy League, with the disproportion often being even greater than the particular example emphasized by Karabel.

Karabel showed that the collapse of WASP resistance to the admission of high-performing Jewish students soon drastically reshaped the ethnic composition of these institutions, with his triumphalist narrative suggesting that this transformation raised academic standards and lifted the quality of the student body to new heights. And for decades, I had entirely accepted this simple morality tale, which was implicitly or explicitly presented in nearly all the accounts, liberal and conservative alike, that I had read regarding the history of our leading East Coast universities.

But as I began to quantitatively explore this issue, utilizing the same techniques and data sets I had applied to determining the existence of severe discrimination against Asian applicants, I uncovered evidence of an entirely contrary nature. I soon came to realize that many of my beliefs were merely ideological fairy tales, sometimes little more accurate than the Soviet claims of Russian peasants eagerly joining their collective farms.

Although Jewish names are not nearly as distinctive as Asian ones, they may usually be determined with reasonable accuracy, and applying Weyl analysis to a subset of the most absolutely characteristic ones—such as Goldstein, Silverberg, Cohen, and Kaplan —allows us to statistically validate the results so obtained.

As I thus analyzed the many dozens of statewide NMS lists, I soon discovered that Jews were far less heavily represented among America’s highest-performing students than I had expected, probably constituting no more than 6% of the national NMS total. The lists of

the winners of the top scholastic competitions I had previously examined for Asians produced reasonably similar results.

Hispanic names are quite distinct and blacks are fewer in number and somewhat less successful academically, so the NMS totals for those two groups are also not difficult to determine. Once we subtract the totals of Asians, Jews, Hispanics, and blacks, what remains is the NMS total of non-Hispanic white Gentiles. And the results were extremely eye-opening:

> The evidence of the recent NMS semifinalist lists seems the most conclusive of all, given the huge statistical sample sizes involved. As discussed earlier, these students constitute roughly the highest 0.5 percent in academic ability, the top 16,000 high school seniors who should be enrolling at the Ivy League and America's other most elite academic universities. In California, white Gentile names outnumber Jewish ones by over 8-to-1; in Texas, over 20-to-1; in Florida and Illinois, around 9-to-1. Even in New York, America's most heavily Jewish state, there are more than two high-ability white Gentile students for every Jewish one. Based on the overall distribution of America's population, it appears that approximately 65–70 percent of America's highest ability students are non-Jewish whites, well over ten times the Jewish total of under 6 percent.
>
> Needless to say, these proportions are considerably different from what we actually find among the admitted students at Harvard and its elite peers, which today serve as a direct funnel to the commanding heights of American academics, law, business, and finance. Based on reported statistics, Jews approximately match or even outnumber non-Jewish whites at Harvard and most of the other Ivy League schools, which seems wildly disproportionate. Indeed, the official statistics indicate that non-Jewish whites at Harvard are America's most under-represented population group, enrolled at a much lower fraction of their national population than blacks or Hispanics, despite having far higher academic test scores.
>
> When examining statistical evidence, the proper aggregation of data is critical. Consider the ratio of the recent 2007–2011 enrollment of Asian students at Harvard relative to their estimated share of America's recent NMS semifinalists, a reasonable proxy for the high-ability college-age population, and compare this result to the corresponding figure for whites. The Asian ratio is 63 percent, slightly above the white ratio of 61

percent, with both these figures being considerably below parity due to the substantial presence of under-represented racial minorities such as blacks and Hispanics, foreign students, and students of unreported race. Thus, there appears to be no evidence for racial bias against Asians, even excluding the race-neutral impact of athletic recruitment, legacy admissions, and geographical diversity.

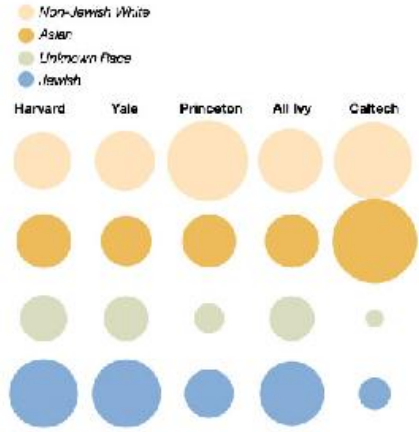
However, if we separate out the Jewish students, their ratio turns out to be 435 percent, while the residual ratio for non-Jewish whites drops to just 28 percent, less than half of even the Asian figure. As a consequence, Asians appear under-represented relative to Jews by a factor of seven, while non-Jewish whites are by far the most under-represented group of all, despite any benefits they might receive from athletic, legacy, or geographical distribution factors. The rest of the Ivy League tends to follow a similar pattern, with the overall Jewish ratio being 381 percent, the Asian figure at 62 percent, and the ratio for non-Jewish whites a low 35 percent, all relative to their number of high-ability college-age students.

Just as striking as these wildly disproportionate current numbers have been the longer enrollment trends. In the three decades since I graduated Harvard, the presence of white Gentiles has dropped by as much as 70 percent, despite no remotely comparable decline in the relative size or academic performance of that population; meanwhile, the percentage of Jewish students has actually increased. This period certainly saw a very rapid rise in the number of Asian, Hispanic, and foreign students, as well as some increase in blacks. But it seems rather odd that all of these other gains would have come at the expense of whites of Christian background, and none at the expense of Jews.

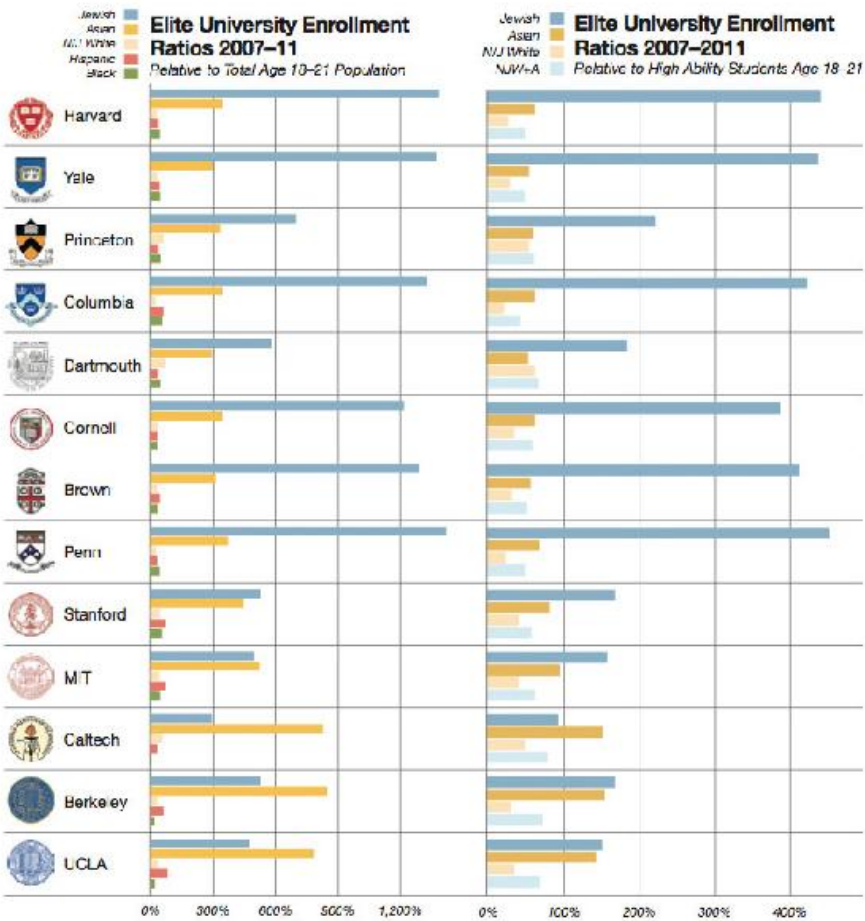
Several graphs from my article effectively illustrated these remarkable findings.

**Elite University Undergraduate Enrollments, 2007-2011**

| University | Non-Jewish White | Asian | Unknown Race | Jewish |
|---|---|---|---|---|
| Harvard | 18% | 16% | 12% | 28% |
| Yale | 20% | 14% | 11% | 29% |
| Princeton | 37% | 8% | 8% | 13% |
| Brown | 22% | 15% | 12% | 24% |
| Columbia | 15% | 16% | 10% | 25% |
| Cornell | 24% | 16% | 14% | 23% |
| Dartmouth | 42% | 14% | 8% | 11% |
| Penn | 17% | 18% | 15% | 27% |
| All Ivy League | 23% | 16% | 11% | 23% |
| Caltech | 33% | 39% | 2% | 3% |
| MIT | 27% | 25% | 6% | 9% |
| Stanford | 28% | 21% | 4% | 10% |
| UC Berkeley | 21% | 40% | 7% | 10% |
| UCLA | 24% | 37% | 4% | 9% |



Source: Appendices C-F



*Note that the ethnic enrollment ratios for Berkeley and UCLA are based on the national demographics, but their students are primarily drawn from within California, whose racial distribution is very different: the white student population is half the national average, while Asians and Hispanics are more numerous by a factor of two, implying different parity ratios. The underlying data for these charts is taken from Appendix F.*

Based on these figures, Jewish students were roughly 1,000% more

likely to be enrolled at Harvard and the rest of the Ivy League than white Gentiles of similar ability. This was an absolutely astonishing result given that under-representation in the range of 20% or 30% is often treated by courts as powerful *prima facie* evidence of racial discrimination.

Furthermore, I noted the possibility that this discrepancy might be related to the overwhelming Jewish dominance of the top administration of those institutions:

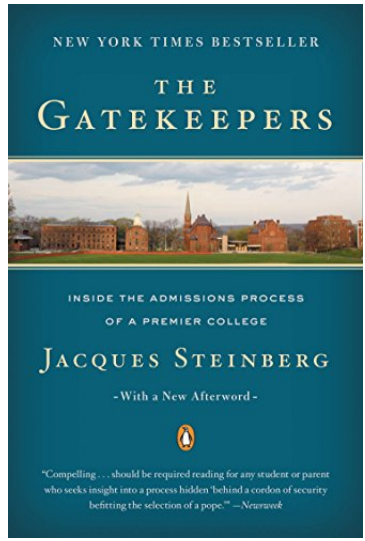
> It would be unreasonable to ignore the salient fact that this massive apparent bias in favor of far less-qualified Jewish applicants coincides with an equally massive ethnic skew at the topmost administrative ranks of the universities in question, a situation which once again exactly parallels Karabel's account from the 1920s. Indeed, Karabel points out that by 1993 Harvard, Yale, and Princeton all had presidents of Jewish ancestry, and the same is true for the current presidents of Yale, Penn, Cornell, and possibly Columbia, as well as Princeton's president throughout during the 1990s and Yale's new incoming president, while all three of Harvard's most recent presidents have either had Jewish origins or a Jewish spouse.
>
> At most universities, a provost is the second-ranking official, being responsible for day-to-day academic operations. Although Princeton's current president is not Jewish, all seven of the most recent Princeton provosts stretching back to 1977 have had such ancestry, with several of the other Ivies not being far behind. A similar degree of massive overrepresentation is found throughout the other top administrative ranks of the rest of the Ivy League, and across American leading educational institutions in general, and these are the institutions which select our future national elites.

Since the publication of my 2012 article, Harvard and Princeton have both selected new presidents, each of them Jewish, while Yale's Jewish president has remained in office.

The exact mechanism by which this seemingly enormous bias in favor of Jewish applicants to our most elite colleges manifests itself is not entirely clear, and I very doubt that it takes the crude form of top administrators directing admissions officers to enroll under-qualified Jewish applicants. Instead, I strongly suggested that a leading factor

was the “negative pressure” of America’s overwhelmingly Jewish media and Jewish activist groups, which might respond harshly to any significant decline in Jewish numbers:

> Meanwhile, any hint of ﷺanti-Semitismﷺ in admissions is regarded as an absolutely mortal sin, and any significant reduction in Jewish enrollment may often be denounced as such by the hair-trigger media. For example, in 1999 Princeton discovered that its Jewish enrollment had declined to just 500 percent of parity, down from more than 700 percent in the mid-1980s, and far below the comparable figures for Harvard or Yale. This quickly resulted in four front-page stories in the *Daily Princetonian*, a major article in the *New York Observer*, and extensive national coverage in both the *New York Times* and the *Chronicle of Higher Education.* These articles included denunciations of Princeton's long historical legacy of anti-Semitism and quickly led to official apologies, followed by an immediate 30 percent rebound in Jewish numbers. During these same years, non-Jewish white enrollment across the entire Ivy League had dropped by roughly 50 percent, reducing those numbers to far below parity, but this was met with media silence or even occasional congratulations on the further ﷺmulticulturalﷺ progress of America's elite education system.
>
> I suspect that the combined effect of these separate pressures, rather than any planned or intentional bias, is the primary cause of the striking enrollment statistics that we have examined above. In effect, somewhat dim and over-worked admissions officers, generally possessing weak quantitative skills, have been tasked by their academic superiors and media monitors with the twin ideological goals of enrolling Jews and enrolling non-whites, with any major failures risking harsh charges of either ﷺanti-Semitismﷺ or ﷺracism.ﷺ But by inescapable logic maximizing the number of Jews and non-whites implies minimizing the number of non-Jewish whites.



NEW YORK TIMES BESTSELLER
THE
GATEKEEPERS
INSIDE THE ADMISSIONS PROCESS
OF A PREMIER COLLEGE
JACQUES STEINBERG
-With a New Afterword-
"Compelling . . . should be required reading for any student or parent who seeks insight into a process hidden 'behind a cordon of security befitting the selection of a pope." —Newsweek

I further noted that this 1999 firestorm of media controversy attacking Princeton for its alleged “anti-Semitism” took place at a time when university’s president and provost were both Jewish, and the campus had recently opened a $4.5 million Center for Jewish Life.

In 2002, Jacques Steinberg, a longtime National Educational Correspondent for the *New York Times*, published *The Gatekeepers*, a widely praised best-seller that provided an “inside look” at the college admissions process based on the year he had spent embedded with those officials at Wesleyan, and the 2012 edition of his book stated that few aspects of the process had changed during the previous decade. I was deeply distressed by his description of the background of the admissions officers:

> In fact, it seems likely that some of these obvious admissions biases we have noticed may be related to the poor human quality and weak academic credentials of many of the university employees making these momentous decisions. As mentioned above, the job of admissions officer is poorly paid, requires no professional training, and offers few opportunities for career advancement; thus, it is often filled by individuals with haphazard employment records. As one of the ﷺLittle Ivies,ﷺ Wesleyan is among America's most prestigious liberal arts colleges, and Steinberg's description of the career paths of its handful of admissions officers is eye-opening: the interim Director of Admissions had most recently screened food-stamp recipients and run a psychiatric half-way house; another had worked as an animal control officer and managed a camera store; a third unsuccessfully sought a job as a United Airlines flight attendant;

> others were recent college graduates, whose main college interests had been sports or ethnic studies. The vast majority seem to possess minimal academic expertise and few intellectual interests, raising serious questions about their ability to reasonably evaluate their higher-quality applicants.

Books by former members of the Harvard and Dartmouth admissions strongly supported the same conclusions.

> As additional evidence, we can consider *What It Really Takes to Get into the Ivy League*, a 2003 advice book written by Chuck Hughes, who spent five years as a Senior Admissions Officer at Harvard, after having himself graduated from that university. Although he strongly emphasizes his own college participation in varsity sports, he never says a word about any personal academic interests, and near the end of his book on elite college admissions, he appears to describe Duke, Northwestern, and Rice as being members of the Ivy League.

> A more explicit statement of this exact problem is found in *A for Admission*, a very candid 1997 description of the admissions process at elite private universities written by Michele A. Hernandez, who had spent four years as Dartmouth's Assistant Director of Admissions. Near the beginning of her book, Hernandez explains that over half of Ivy League admissions officers are individuals who had not attended such academically challenging universities, nor probably had the intellectual capability to do so, and were sometimes confused about the relative ranking of SAT scores and other basic academic credentials. She also cautions students to avoid any subtlety in their essays, lest their words be misunderstood by their readers in the admissions office, whose degrees are more likely to have been in education than in any serious academic discipline.

Given this unfortunate situation, we should not be overly surprised by the egregious aspects of the particular admissions stories that Steinberg recounts.

> Consider the case of Tiffany Wang, a Chinese immigrant student raised in the Silicon Valley area, where her father worked as an engineer. Although English was not her first language, her SAT scores were over 100 points above the Wesleyan average, and she ranked as a National Merit Scholarship semifinalist, putting her in the top 0.5 percent of high school students (not the top 2 percent as Steinberg mistakenly claims). Nevertheless, the admissions

officer rated her just so-so in academics, and seemed far more positively impressed by her ethnic activism in the local school's Asian-American club. Ultimately, he stamped her with a "Reject," but later admitted to Steinberg that she might have been admitted if he had been aware of the enormous time and effort she had spent campaigning against the death penalty, a political cause near and dear to his own heart. Somehow I suspect that a student who boasted of leadership in pro-death penalty activism among his extracurriculars might have fared rather worse in this process. And presumably for similar reasons, Tiffany was also rejected by all her other prestigious college choices, including Yale, Penn, Duke, and Wellesley, an outcome which greatly surprised and disappointed her immigrant father.

There was also the case of half-Brazilian Julianna Bentes, with slight black ancestry, who came from a middle-class family and attended on a partial scholarship one of America's most elite prep schools, whose annual tuition now tops $30,000; her SAT scores were somewhat higher than Tiffany's, and she was an excellent dancer. The combination of her academic ability, dancing talent, and "multiracial" background ranked her as one of America's top college recruitment prospects, gaining her admission and generous financial packages from Harvard, Yale, Stanford and every other elite university to which she applied, including the University of Chicago's most prestigious academic scholarship award and a personal opportunity to meet Chelsea Clinton while visiting Stanford, which she did, before ultimately selecting Yale.

Finally, there was the case of Becca Jannol, a girl from a very affluent Jewish family near Beverly Hills, who attended the same elite prep school as Julianna, but with her parents paying the full annual tuition. Despite her every possible advantage, including test-prep courses and retaking the exam, her SAT scores were some 240 points lower on the 1600 point scale, placing her toward the bottom of the Wesleyan range, while her application essay focused on the philosophical challenges she encountered when she was suspended for illegal drug use. But she was a great favorite of her prep school counselor, who was an old college friend of the Wesleyan admissions officer, and using his discretion, he stamped her "Admit." Her dismal academic record then caused this initial decision to be overturned by a unanimous vote of the other members of the full admissions committee, but he refused to give up, and moved heaven and earth to gain her a spot, even offering to rescind the admissions of one or more already selected applicants to create a place for her.

> Eventually he got her shifted from the Reject category to wait-list status, after which he secretly moved her folder to the very top of the large waiting list pile.
>
> In the end "connections" triumphed, and she received admission to Wesleyan, although she turned it down in favor of an offer from more prestigious Cornell, which she had obtained through similar means. But at Cornell, she found herself "miserable," hating the classes and saying she "didn't see the usefulness of [her] being there." However, her poor academic ability proved no hindrance, since the same administrator who had arranged her admission also wrangled her a quick entrance into a special "honors program" he personally ran, containing just 40 of the 3500 students in her year. This exempted her from all academic graduation requirements, apparently including classes or tests, thereby allowing her to spend her four college years mostly traveling around the world while working on a so-called "special project." After graduation, she eventually took a job at her father's successful law firm, thereby realizing her obvious potential as a member of America's ruling Ivy League elite, or in her own words, as being one of "the best of the best."

Jannol's account also contains a particularly intriguing element. Personal essays have become a crucial component of application packages to elite colleges, and these are considered especially effective if they provide strong evidence of hardships and victimhood. Given her extremely wealthy and privileged background, Jannol had originally considered focusing on her status as the granddaughter of a Holocaust survivor, but ultimately decided against it because so many of her peers would be following exactly that same stratagem, explaining to Steinberg that "Everyone's going to write about their Holocaust grandma."

Over the last few decades, our news and entertainment industries have elevated Jewish suffering during World War II into the most horrific and monumental tragedy of the modern era, and it not impossible that a substantial fraction of the unfair Jewish advantage in elite admissions may derive from something as simple as the ability of the children of elite Jewish families to wrap themselves in the ultimate victimhood of Holocaust survivor status.

I had been stunned by my evidence of the unreasonable over-

representation of Jewish students at our most elite academic institutions, and most of the prominent scholars and journalists who read my analysis seemed to have a similar reaction. Further analysis suggested some of the crucial reasons for this widespread myopia, which I explicated in a section entitled “The Strange Collapse of Jewish Academic Achievement.”

> From my own perspective, I found these statistical results surprising, even shocking.
>
> I had always been well aware of the very heavy Jewish presence at elite academic institutions. But the underwhelming percentage of Jewish students who today achieve high scores on academic aptitude tests was totally unexpected, and very different from the impressions I had formed during my own high school and college years a generation or so ago. An examination of other available statistics seems to support my recollections and provides evidence for a dramatic recent decline in the academic performance of American Jews
>
> The U.S. Math Olympiad began in 1974, and all the names of the top scoring students are easily available on the Internet. During the 1970s, well over 40 percent of the total were Jewish, and during the 1980s and 1990s, the fraction averaged about one-third. However, during the thirteen years since 2000, just two names out of 78 or 2.5 percent appear to be Jewish. The Putnam Exam is the most difficult and prestigious mathematics competition for American college students, with five or six Putnam winners having been selected each year since 1938. Over 40 percent of the Putnam winners prior to 1950 were Jewish, and during every decade from the 1950s through the 1990s, between 22 percent and 31 percent of the winners seem to have come from that same ethnic background. But since 2000, the percentage has dropped to under 10 percent, without a single likely Jewish name in the last seven years.
>
> This consistent picture of stark ethnic decline recurs when we examine the statistics for the Science Talent Search, which has been selecting 40 students as national finalists for America's most prestigious high school science award since 1942, thus providing a huge statistical dataset of over 2800 top science students. During every decade from the 1950s through the 1980s, Jewish students were consistently 22–23 percent of the recipients, with the percentage then declining to 17 percent in the 1990s, 15 percent in the 2000s, and just 7 percent since 2010. Indeed, of the

thirty top ranked students over the last three years, only a single one seems likely to have been Jewish. Similarly, Jews were over one-quarter of the top students in the Physics Olympiad from 1986 to 1997, but have fallen to just 5 percent over the last decade, a result which must surely send Richard Feynman spinning in his grave.

…

Taken in combination, these trends all provide powerful evidence that over the last decade or more there has been a dramatic collapse in Jewish academic achievement, at least at the high end.

Several possible explanations for this empirical result seem reasonably plausible. Although the innate potential of a group is unlikely to drop so suddenly, achievement is a function of both ability and effort, and today's overwhelmingly affluent Jewish students may be far less diligent in their work habits or driven in their studies than were their parents or grandparents, who lived much closer to the bracing challenges of the immigrant experience. In support of this hypothesis, roughly half of the Jewish Math Olympiad winners from the last two decades have had the sort of highly distinctive names which would tend to mark them as recent immigrants from the Soviet Union or elsewhere, and such names were also very common among the top Jewish science students of the same period, even though this group represents only about 10 percent of current American Jews. Indeed, it seems quite possible that this large sudden influx of very high performing immigrant Jews from the late 1980s onward served to partially mask the rapid concurrent decline of high academic achievement among native American Jews, which otherwise would have become much more clearly evident a decade or so earlier.

This pattern of third or fourth generation American students lacking the academic drive or intensity of their forefathers is hardly surprising, nor unique to Jews. Consider the case of Japanese-Americans, who mostly arrived in America during roughly the same era. America's Japanese have always been a high-performing group, with a strong academic tradition, and Japan's international PISA academic scores are today among the highest in the world. But when we examine the list of California's NMS semifinalists, less than 1 percent of the names are Japanese, roughly in line with their share of the California population. Meanwhile, Chinese, Koreans, and South Asians are 6

percent of California but contribute 50 percent of the top scoring students, an eight-fold better result, with a major likely difference being that they are overwhelmingly of recent immigrant origin. In fact, although ongoing Japanese immigration has been trivial in size, a significant fraction of the top Japanese students have the unassimilated Japanese first names that would tend to indicate they are probably drawn from that tiny group.

In his 1966 book *The Creative Elite in America*, Weyl used last name analysis to document a similarly remarkable collapse in achievement among America's Puritan-descended population, which had once provided a hugely disproportionate fraction of our intellectual leadership, but for various reasons went into rapid decline from about 1900 onward. He also mentions the disappearance of the remarkable Scottish intellectual contribution to British life after about 1800. Although the evidence for both these historical parallels seems very strong, the causal factors are not entirely clear, though Weyl does provide some possible explanations.

In some respects, perhaps it was the enormously outsize Jewish academic performance of the past which was highly anomalous, and the more recent partial convergence toward white European norms which is somewhat less surprising. Over the years, claims have been widely circulated that the mean Jewish IQ is a full standard deviation—15 points—above the white average of 100, but this seems to have little basis in reality. Richard Lynn, one of the world's foremost IQ experts, has performed an exhaustive literature review and located some 32 IQ samples of American Jews, taken from 1920 to 2008. For the first 14 studies conducted during the years 1920–1937, the Jewish IQ came out very close to the white American mean, and it was only in later decades that the average figure rose to the approximate range of 107–111.

In a previous article "Race, IQ & Wealth," I had suggested that the IQs of ethnic groups appear to be far more malleable than many people would acknowledge, and may be particularly influenced by factors of urbanization, education, and affluence. Given that Jews have always been America's most heavily urbanized population and became the most affluent during the decades in question, these factors may account for a substantial portion of their huge IQ rise during most of the twentieth century. But with modern electronic technology recently narrowing the gaps in social environment and

educational opportunities between America's rural and urban worlds, we might expect a portion of this difference to gradually dissipate. American Jews are certainly a high-ability population, but the innate advantage they have over other high-ability white populations is probably far smaller than is widely believed.

This conclusion is supported by the General Social Survey (GSS), an online dataset of tens of thousands of American survey responses from the last forty years which includes the Wordsum vocabulary test, a very useful IQ proxy correlating at 0.71. Converted into the corresponding IQ scores, the Wordsum-IQ of Jews is indeed quite high at 109. But Americans of English, Welsh, Scottish, Swedish, and Catholic Irish ancestry also have fairly high mean IQs of 104 or above, and their combined populations outnumber Jews by almost 15-to-1, implying that they would totally dominate the upper reaches of the white American ability distribution, even if we excluded the remaining two-thirds of all American whites, many of whose IQs are also fairly high. Furthermore, all these groups are far less highly urbanized or affluent than Jews, probably indicating that their scores are still artificially depressed to some extent. We should also remember that Jewish intellectual performance tends to be quite skewed, being exceptionally strong in the verbal subcomponent, much lower in math, and completely mediocre in visuospatial ability; thus, a completely verbal-oriented test such as Wordsum would actually tend to exaggerate Jewish IQ.

Stratifying the white American population along religious lines produces similar conclusions. An analysis of the data from the National Longitudinal Survey of Youth found that Americans raised in the Episcopal Church actually exceeded Jews in mean IQ, while several other religious categories came quite close, leading to the result that the overwhelming majority of America's high-ability white population had a non-Jewish background.

Finally, in the case of Jews, these assimilation- or environment-related declines in relative academic performance may have been reinforced by powerful demographic trends. For the last generation or two, typical Jewish women from successful or even ordinary families have married very late and averaged little more than a single child, while the small fraction of Jewish women who are ultra-Orthodox often marry in their teens and then produce seven or eight children. As a consequence, this extremely religious subpopulation has been doubling in size every twenty years, and now easily exceeds 10 percent of the total,

including a far higher percentage of younger Jews. But ultra-Orthodox Jews have generally been academically mediocre, often with enormously high rates of poverty and government dependency. Therefore, the combination of these two radically different trends of Jewish reproduction has acted to stabilize the total number of Jewish youngsters, while probably producing a sharp drop in their average academic achievement.

Although the relative importance of these individual factors behind Jewish academic decline is unclear, the decline itself seems an unmistakable empirical fact, and the widespread unawareness of this fact has had important social consequences.

My casual mental image of today's top American students is based upon my memories of a generation or so ago, when Jewish students, sometimes including myself, regularly took home a quarter or more of the highest national honors on standardized tests or in prestigious academic competitions; thus, it seemed perfectly reasonable that Harvard and most of the other Ivy League schools might be 25 percent Jewish, based on meritocracy. But the objective evidence indicates that in present day America, only about 6 percent of our top students are Jewish, which now renders such very high Jewish enrollments at elite universities totally absurd and ridiculous. I strongly suspect that a similar time lag effect is responsible for the apparent confusion in many others who have considered the topic.

For example, throughout his very detailed book, Karabel always seems to automatically identify increasing Jewish enrollments with academic meritocracy, and Jewish declines with bias or discrimination, retaining this assumption even when his discussion moves into the 1990s and 2000s. He was born in 1950, graduated Harvard in 1972, and returned there to earn his Ph.D. in 1977, so this may indeed have been the reality during his formative years. But he seems strikingly unaware that the world has changed since then, and that over the last decade or two, meritocracy and Jewish numbers have become opposing forces: the stricter the meritocratic standard, the fewer the Jews admitted.

Evidence of the remarkable collapse of Jewish academic achievement is easily seen in a series of charts:

**U.S. Math Olympiad Teams**

Important results with major policy implications will only have significant impact if they are widely distributed, and in this regard I faced formidable obstacles.

My article was running in *The American Conservative*, a small circulation political opinion magazine of which I was the publisher,

and so my findings needed to break through into far larger and more mainstream outlets in order to reach a sizable audience. But in the past *TAC* had often been fiercely denounced by Jewish activists and organizations, mostly on foreign policy issues, and elements of my piece were far more inflammatory than had been any of that other material. While harsh attacks might help promote my information within particular ideological circles, they would surely dissuade mainstream publications from taking notice, and would also sufficiently stigmatize my research that no respectable individual would be willing to cite it in the future.

My first decision was to place my Asian Quota section near the front of my very long text. Aside from the intrinsic importance, this would also provide interested readers with a relatively safe "hook" that they could use to describe and promote my analysis, while allowing them to safely avoid mention of the "third rail" material that constituted the bulk of my text; and this was exactly what eventually occurred. But such a strategy would obviously fail unless I could also somehow induce hair-trigger activist groups to maintain silence about my article rather than crudely demonizing it. Therefore, I decided to launch what I considered a decapitating first strike against those central organs of Jewish activism but to do so in a rather oblique manner.

Jerome Karabel certainly ranked as the world's foremost authority on Jewish admissions to the Ivy League, and his celebrated opus had been the central text I had used, although my ultimate conclusions were radically different than his own. It seemed likely to me that once Jewish organizations became aware of the controversial elements of my article, he would be among the first individuals they contacted, both to seek his assessment of my analysis and perhaps also receive suggestions for an effective rebuttal.

Therefore, I obtained Karabel's contact information and sent him an advance copy of my completed article weeks before it was generally released, explaining that I thought he would find it rather interesting although some of my conclusions were quite different than his own. My expectation was that once he carefully read my detailed analysis, he would conclude that the case I made was far too strong to be effectively refuted, and he would pass along that verdict to the activist organizations when they eventually contacted him, thus leading them adopt a response of "strategic silence" in order to avoid drawing attention to my claims. For whatever reason, that was exactly how they reacted, and no prominent Jewish activist or group ever issued a public response to my extremely controversial findings despite the considerable attention these ultimately attracted.

Not only did this complete absence of organized attacks provide a green light for the very favorable mainstream coverage I soon began receiving, but it even opened the door to quite friendly treatment from numerous members of the organized Jewish community itself, as they discovered and read my article without any prior negative preconceptions. Most of these discussions focused directly upon the evidence of the sharp recent decline in Jewish academic ability and the resulting Jewish over-representation at elite universities, with a professor of Talmud Studies at Yeshiva University publishing a thousand-word column entitled "Endangered Jewish Genius" and NYU's Berman Jewish Policy Center featuring my article on its website. Even the Israeli press took notice, with a columnist for *Israel Hayom*, Sheldon Adelson's top-circulation newpaper, devoting a 1500 word column to my analysis, focusing especially upon my claims of Jewish over-representation.

But although prominent Jewish activists maintained their strict blockade against any discussion of my findings, the Jewish community has never lacked for extreme zealots, and some of these did eventually launch ferocious attacks on my work. However, these were fringe figures, so they were very slow off the mark in their responses and lacked significant credibility or media support. Therefore, their complaints had little impact, especially because they were largely self-refuting.

My fiercest academic critic was a certain cancer researcher named Janet Mertz, a fanatic feminist whose previous public efforts had been focused on vilifying and refuting former Harvard president Larry Summers for his mild but impolitic suggestion that perhaps men might be a bit better at math than women, a position she regarded as utter anathema. To that end, she had published a 10,000 word peer-reviewed analysis of decades worth of International Math Olympiad participants, which convincingly demonstrated that across almost every time period and country, roughly 95% of the best mathematicians had been male and only 5% female. But she rather bizarrely claimed that this conclusively proved that males and females had exactly equal mathematical aptitude, and then persuaded *Science Daily* and other gullible media outlets to publish headlined news stories touting her powerful debunking of male chauvinist mythology.

Mertz was equally zealous in her Jewish identitarianism, and she had invested enormous effort in exhaustively determining the exact fractional Jewish ancestry of all of America's recent Math Olympians. As a consequence, she fiercely denounced as mere "guesswork" my own estimates of Jewish numbers, based as they were upon a much

more casual inspection of surnames, supplemented by Weyl analysis. I think my response was quite effective.

> As it happens, she and her co-authors had exhaustively researched the ethnicity of the 1988-2007 American Math Olympians in their aforementioned 2008 article, and through a combination of extensive biographical research and confidential personal interviews had determined the exact number of full-Jews and part-Jews among those 120 individuals, publishing the results in their Table 7 mentioned above, together with the broader racial categories.
>
> Given that I had produced my own ethnic estimates for those same students based on perhaps five minutes of cursory surname analysis, while Mertz and her associates seemingly devoted five weeks of research to the same task, I readily acknowledge that her results are certain to be vastly more accurate than my own. Indeed, if we regard the Mertz figures as the "gold standard," then comparing them with my own numbers provides a useful means of assessing the overall quality of my direct inspection technique, a technique that constituted a central pillar of my entire study. This allows us to decide whether my approach was indeed just the worthless "guesswork" that she alleges.
>
> Her peer-reviewed journal article determined that the 120 American Math Olympians from 1988-2007 consisted of exactly 42 Asians, 26 Jews, and 52 non-Jewish whites. My crude surname estimate had been 44 Asians, 23 Jews, and 53 non-Jewish whites. Individual readers must decide for themselves whether these estimation errors seem so enormous as to totally invalidate my overall conclusions, but personally I would be quite satisfied if they remained in this range across the tens of thousands of surnames I had inspected throughout the rest of my paper.
>
> Obviously, such estimation techniques may be completely incorrect for tiny handfuls of names, and should only be relied upon across substantial lists. For example, in one sentence of my 30,000 word article I stated that just 2 of the 78 names of Olympiad winners since 2000 seemed likely to be Jewish, and Mertz has repeatedly attacked me for this claim, now pointing out that I had missed the Hebrew name of winner "Oaz Nir." She is correct, and since Nir was a double winner in 2000 and 2001, this single surname error on my part accounts for virtually the entire discrepancy between my own 1988-2007 Olympiad results and those produced by the exhaustive research undertaken by Mertz

and her three academic co-authors.

The only reason that I or anyone else even became aware of Mertz's harsh critique of my analysis was the heavy promotion she received by Andrew Gelman, a professor of Statistics at Columbia University and a prominent blogger, who thereby apparently hoped to undercut my findings without directly involving himself and thereby risking his own reputation. But once I informed him of some of her previous scholarly claims regarding gender issues, he seemed to abandon the project.

A close Mertz ally was a much younger woman named Nurit Baytch, whom I actually encountered in person. As I was giving my lecture at the University of Chicago Law School, I couldn't help but notice a rather short young woman sitting in the front row, glaring at me with a glassy-eyed stare. I am hardly a clothes-horse, but she was dressed very strangely, and when she afterward came up to "confront me," her mannerisms and style of speaking were quite odd as well. All in all, her appearance much reminded me of the photos of female Weather Underground terrorists of the late 1960s, most of whom had also come from a Jewish background.

Eventually, Ms. Baytch wrote a massive document purportedly refuting my Meritocracy analysis, and since it was never published anywhere, she posted it on the Internet as a GoogleDocs file, which countless Jewish activists have subsequently cited as a conclusive debunking of my claims. But all her tens of thousands of words of complex verbiage cannot get around the simple fact that only about 6% of America's high-performing NMS students are Jewish and the remaining 94% are Gentile.

Her other line of criticism was to denounce my use of the Hillel numbers for Jewish enrollment, which she claimed were completely fraudulent, though without any evidence buttressing her claim. Although for decades, these Hillel figures had been accepted without reservation by all our leading media outlets and academic researchers, I had actually treated them with some caution, perhaps being the first analyst to do so.

> Similarly, nearly all our figures on Jewish enrollment were ultimately drawn from the estimates of Hillel, the national Jewish campus organization, and these are obviously approximate. However, the Hillel data is the best we possess for recent decades, and is regularly used by the *New York Times* and other prominent media outlets, while also serving as the basis for much of

> Karabel's award-winning scholarship. Furthermore, so long as any latent bias in the data remained relatively constant, we could still correctly analyze changes over time.

Completely discarding as unreliable the tens of thousands of annual Jewish enrollment estimates compiled by Hillel over the last half-century would completely eliminate almost everything we know about the historical size and trajectory of the Jewish presence at thousands of American colleges, destroying the sociological studies of many scholars. But fortunately, it seems quite unlikely that the figures are as completely nonsensical as Baytch casually claims.

These Hillel estimates have been very widely circulated within the Jewish community for decades and republished in Jewish magazines, being primarily intended to help guide strongly-identified Jewish families in selecting a college campus with a Jewish enrollment in the range they considered necessary. For most families, the cost of a college education is one of the largest investments they will ever make, and if for decades, tens or hundreds of thousands of committed Jewish families had picked their colleges based on the Hillel numbers only to discover that those figures had no connection to reality, surely there would have been a huge and angry backlash. But there is no record of any such complaints.

For many years, Harvard Hillel had regularly claimed that half or more of all the white undergraduates on the campus came from a Jewish background, and if this figure were wildly inaccurate, surely someone at Harvard Hillel would have eventually noticed that error and corrected it, with the same being true for Yale, Columbia, Penn, and numerous other colleges. Obviously, the criteria used to classify a student as Jewish are somewhat elastic, and we can easily suppose that the estimate generally includes part-Jews who in any way identified with that community, and may have been been somewhat exaggerated due to ethnic boosterism. But it seems highly unlikely that the figures would be utterly and demonstrably false.

These arguments based on general plausibility are strongly supported by quantitative evidence, and ironically enough, it is Baytch herself who provided it. Around the time she produced her lengthy and unpublished document, Harvard Hillel was claiming a Jewish undergraduate enrollment of 25%, and near the beginning of her text, she claimed that figure was obviously false by citing a *Harvard Crimson* survey indicating that only 9.5% of the Class of 2017 were Jewish. However, she failed to notice that the survey referred to being *religiously* Jewish, which is entirely different than being Jewish

in the broader ethnic or ancestral sense, especially since Jews are among the most secular population in American society and a full 42% of the Harvard students described their religious beliefs as atheist, agnostic, or "other." Indeed, a worldwide survey finds that only 38% of (ethnic) Jews follow the Jewish *religion*. So if the *Crimson* survey were correct and Harvard Jews were typical in their religiosity, this would imply that 9.5% / 0.38 = 25%(!!!) of Harvard freshman were ethnically Jewish, *exactly* the figure claimed by Harvard Hillel. Fanatic ideologues such as Baytch sometimes have a tendency to score game-ending own-goals without even realizing what they have done.

In general, classifying an individual as Jewish has a rather protean nature, with somewhat overlapping definitions based on religion, ethnicity, and full or partial ancestry, allowing it to be drastically expanded or contracted for various reasons. I suspect that Baytch's confusion on this matter was entirely sincere, related to the obsessive tendencies she exhibited in real life. But others may employ these shifting definitions based upon more pragmatic considerations.

It is well known that for many decades the American Communist Party and especially its top leadership was overwhelmingly Jewish, even at a time when Jews were just 3% of the national population. But Jewish community leaders were not pleased with this situation, and they sometimes flatly denied the reality, insisting that there were actually no Jewish Communists whatsoever—how could there be, when Communists were hostile to all religious belief?

Similarly, my findings that Jews were apparently enrolled at Harvard and other elite colleges at a rate some 1,000% greater than white Gentiles of similar academic performance must surely have set off alarm bells within the leadership of Jewish activist organizations, who wondered how best to manage or conceal this potentially dangerous information. With a high-profile Asian discrimination lawsuit wending its way through the courts and my own unsuccessful 2016 attempt to run a slate of candidates for the Board of Harvard Overseers, the likelihood of growing public scrutiny surely loomed very large.

Baytch's apparent confusion between having Jewish ancestry and practicing the Jewish religion would have been well-known in these circles, and offered an obvious solution. If Jewish numbers were suddenly narrowed to only include those students who claimed to

follow Jewish religious practices, the flagrant over-representation of Jews on elite campuses would be greatly reduced. Meanwhile, large numbers of lesser-qualified applicants of Jewish ancestry but no religious belief could continue to gain unfair admission by writing essays about their "Holocaust grandmas" with America's 98% Gentile population being none the wiser.

For whatever reason, Hillel seems to have recently adopted this practice, drastically reducing its published estimates of the Jewish enrollment at Harvard and other elite colleges, thus eliminating a glaring example of ethnic bias by a simple act of redefinition. For example, the Hillel website now claims that merely 11% of Harvard undergraduates are Jewish, a huge reduction from the previous 25% figure, and a total suspiciously close to the *Crimson* survey of a few years ago which counted Jews only based upon their religious beliefs. The Hillel figures for Yale, Princeton, and most other elite colleges have experienced equally sudden and huge declines.

One very strong clue regarding this new definition of Jewish enrollment comes from Caltech, an elite science and engineering school which is quite unlikely to attract Jews professing religious faith. According to the Hillel website, the Jewish enrollment is 0%, claiming that there absolutely no Jews on campus. Despite this, the website also describes the vibrant Jewish life at Caltech, with Caltech Jews involved in all sorts of local activities and projects. This absurd paradox is obviously due to the distinction between individuals who are Jewish by religion and those who are Jewish by ancestry.

As the 1999 media firestorm engulfing Princeton demonstrated, in the past even slight and gentle declines of Jewish enrollment over a fifteen year period would provoke massive controversy and angry denunciations from Jewish organizations. The absolute lack of any organized response to the recent sudden disappearance of nearly 60% of Harvard's Jews certainly suggests that little more than a mere change in definition had occurred.

Many years ago as a young and naive undergraduate, I would regularly spend my dinners discussing all sorts of political and policy issues with my fellow classmates in our Harvard dining hall.

Affirmative Action was a regular topic of our conversations, and I would occasionally note how odd America was in that regard. No other example came to mind in which an ethnic group had established

a legalized system of racial discrimination against its own members, while similar sorts of systems aimed at excluding or disadvantaging rival ethnic groups were all too common in world history.

As the decades went by, I gradually noticed that the huge and continuing increase in the enrollment of non-white and foreign students at our most elite universities had caused a complete collapse in the enrollment of white American Gentiles, but oddly enough, no similar reduction in Jewish numbers. It was well-known that Jewish activists had been the primary force behind the establishment of Affirmative Action and related policies in college admissions, and I began to wonder about their true motivation, whether conscious or unconscious.

Had the goal been the stated one, of providing educational opportunities to previously excluded groups? Or had that merely been the excuse used to advance a policy that eliminated the majority of white Gentiles, their primary ethnic competitors? With the Jewish population numbering merely 2%, there was an obvious limit as to how many elite college slots they themselves could possibly fill, but if enough other groups were also brought in, then Gentile numbers could easily be reduced to low levels, despite the fact that they constituted the bulk of the national population.

Asians represented an interesting test-case. As their numbers rapidly grew, white Gentiles were consequently pushed out, and this process was celebrated across the academic community. But by the late 1980s, Asian numbers had increased to such an extent that they inevitably began to impinge upon elite Jewish enrollment as well and future increases would surely worsen the situation. And at that point, the process suddenly halted, with Asian numbers being sharply reduced and thereafter permanently capped. The implications of this situation were already in the back of my mind when I published my 1998 *Wall Street Journal* column describing some of these striking racial facts.

The current high-profile trial in Boston is widely portrayed by the media as a conflict between Asian-American groups, whose educational interests suffer under the current subjective and opaque admissions system, and black and Hispanic groups, whose numbers might be sharply reduced under some proposed changes. Whites are largely portrayed as bystanders, with Harvard indicating that their numbers would scarcely shift even under drastic changes in admissions policy. But the term “white” encompasses both Jews and Gentiles, and thus may conceal more than it reveals.

The implications of my 2012 Meritocracy analysis are certainly well-known to all of the prominent participants and observers in the ongoing legal battle, but the fearsome power of the ADL and its media allies ensures that certain important aspects of the current situation are never subjected to widespread public discussion.  Asian advocates rightly denounce the unfairness of the current elite academic admissions system, but remain absolutely mute about which American group actually controls the institutions involved.

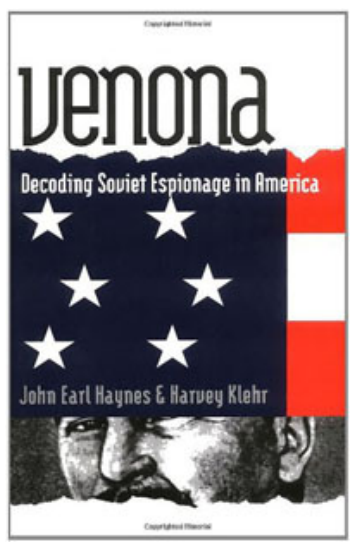
Throughout the enormous media controversy surrounding the Harvard trial in Boston, all sides are doing their utmost to avoid noticing the 2% elephant in the room. And that fact provides the best proof of the tremendous size and power of that elephant in today's American society.

# Amazon Book Censorship

*Banning Black Historiography During Black History Month*

March 11, 2019 • 7,600 Words

As most are surely aware, the last year or two has seen a growing crackdown on free speech and free thought across the Internet, with our constitutionally-protected First Amendment rights being circumvented through the agency of monopolistic private sector corporations such as Facebook, Twitter, and Google. Although as yet our government has not gained the power to ban discordant views nor punish their advocates, anonymous tech company censors regularly take these steps, seemingly based upon entirely opaque and arbitrary standards which lack any power of appeal. No one really knows why some individuals are banned or "de-platformed" and others are not, and surely this looming uncertainty has imposed self-censorship upon hundreds of individuals for every publicized victim who receives an exemplary punishment.

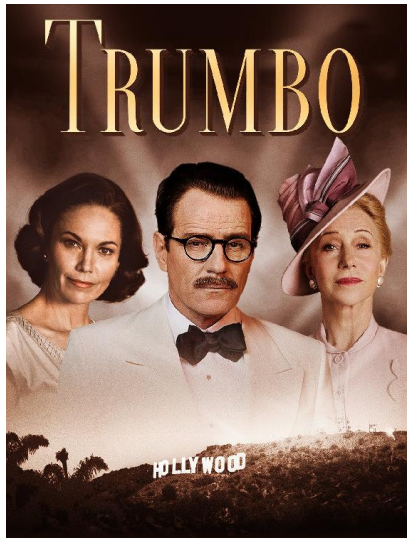


Some critics have attacked this policy as a new form of "McCarthyism," but this characterization seems based upon historical ignorance.  Although the notorious junior senator from Wisconsin was an alcoholic prone to making reckless, unsubstantiated charges and therefore served as an extremely poor vessel for the movement he eventually came to symbolize, his accusations of massive Communist political subversion were absolutely correct and indeed somewhat understated. Over the last quarter-century, the public release of the

Venona Decrypts has demonstrated that throughout most of the Franklin Roosevelt Administration and even afterward, the top levels of our national government were honeycombed with numerous spies and traitors deeply loyal to the Soviet Union rather than the United States. Today's ritualistic denunciations of McCarthyism are made by ignorant journalists who derive their understanding of the past from misleading Hollywood dramas rather than the meticulously researched volumes produced by leading academic scholars such as John Earl Haynes and Harvey Klehr.

In fact, just a few years before Sen. McCarthy burst upon the national scene, control of our federal government was nearly seized by agents of Stalin. From 1941 to 1944 FDR's Vice President was Henry Wallace, who would have succeeded to the presidency if Roosevelt had renominated him in that latter year or had died prior to early 1945. And although Wallace himself was not disloyal, his top advisors were mostly Communist agents. Indeed, he later stated that a Wallace Administration would have included Laurence Duggan as Secretary of State and Harry Dexter White as Secretary of the Treasury, thereby installing Stalinist henchmen at the top of the Cabinet, presumably supported by numerous lower-level officials of a similar political ilk. One might jokingly speculate whether the Rosenbergs—later executed for treason—would have been placed in charge of our nuclear weapons development program.

That America's national government of the early 1940s actually came within a hair's breadth—or rather a heart-beat—of falling under Communist control is a very uncomfortable truth. And our history books and popular media have maintained such total silence about this remarkable episode that even among today's well-educated Americans I suspect that fewer than five in one hundred are aware of this grim reality. Surely this should cause all sensible people to become quite cautious about blithely accepting the standard narrative of other important historical events promoted by those same sources of obfuscation.



Even leaving aside this total whitewash of Communist infiltration during the 1930s and 1940s, the measures imposed upon the supposed martyrs of that era utterly differ in degree from those visited upon today's ideological dissenters. In the best-known cases, a few of Hollywood's most highly-paid screenwriters saw their income dry up due to their Communist affiliations and were forced to cut back on their lavish lifestyles, a personal suffering treated with utmost sympathy in recent mainstream films produced by their spiritual descendants. Meanwhile, today's targets of social wrath are almost always just working-stiffs, powerless nobodies fearfully voicing their controversial online opinions under a pseudonym before having their identities "doxxed" and then sometimes getting fired from their merely hum-drum jobs.

And even that gross disparity drastically understates the difference between then and now. During the 1950s, any proposal to ban suspected Communists from making telephone calls, watching television, renting cars, or having bank accounts surely would have been universally ridiculed as utter lunacy. But in today's America, entirely equivalent measures are steadily growing more frequent and more severe, with very little public opposition.

Social media platforms have become the new electronic town square, and just a few weeks ago our own Israel Shamir's recounted how he was "Banned by Facebook for Telling the Truth." He described the absurd levels of censorship that he and so many others have suffered on that platform, sometimes even being punished with a lengthy ban merely for posting a link to his own writings.

I don't much use Social Media myself since my long-form writings are hardly suitable for Facebook let alone the tiny character budget of Twitter. And although the latter seems effective as a means of promoting articles or distributing images or videos, the strict limits of a few dozen words surely render it much more appropriate for slogans or insults than anything more thoughtful or substantive. I find it difficult to believe that too many intelligent people have ever had their minds changed on anything significant by a few Tweets.

Amazon, however, is something else entirely. Its unmatched collection of available books comes close to fulfilling one of the original utopian goals of the very early days of the Computer Age. Over the last twenty years I've surely ordered many hundreds of volumes from that source, and reading them has played a huge role in transforming my beliefs on numerous important issues. For this reason, the growing wave of Amazon book-bannings carries very ominous overtones.

On February 19th, an article in *Quartz* denounced Amazon for continuing to carry "neo-Nazi and White Supremacist" books, and the following week most of the books in question were suddenly "disappeared" after many years of availability, in some cases apparently even vanishing from personal Kindle devices. An article published in *American Renaissance* provided one of the earliest accounts, and *Counter-Currents* has attempted to put together a comprehensive list of the dozens of vanished volumes.

The overwhelming majority of the banned works appear to be rightwing texts of a hortatory nature, generally falling under the rubric of White Nationalism or the Alt-Right. Glancing over the list, I found that I was only very slightly familiar with most of them, the most notable exception being *The Turner Diaries* by William Pierce, which became something of a national best-seller in 1995 when the media claimed that it had served as the inspiration for the Oklahoma City Bombing. My own suspicion is that essays and articles of similar ideological sentiments exist in enormous quantities all across the Internet, and these possess vastly greater aggregate readership. It is not entirely clear what those pressuring Amazon had hoped to achieve by making those same ideas of white advocacy less available in concentrated book form. However, the almost unnoticed purge of various other Amazon books, of an entirely different nature, may have far greater negative ramifications.

The ADL ranks as one of our most formidable Jewish activist organizations, and according to media accounts it has been playing a central role in efforts to censor "hate speech" on leading Internet platforms such as Facebook, Twitter, and Google's YouTube. So it seems very likely to have also been behind Amazon's recent purge, especially once we discover the nature of some of the more significant books now banned.

Such a role for the ADL is extremely unfortunate, given that organization's long and very sordid history, which includes massive amounts of outright criminal activity, as I had discussed in a long article a few months ago. In fact, if not for the very widespread cowardice and dishonesty of our establishment media, the ADL would have long since lost all shreds of public credibility, and indeed most of its top leadership might well be serving long sentences in federal prison.

In recent years, almost no media mention of the late FBI Director J. Edgar Hoover fails to include condemnation of his sordid role in illegally recording Martin Luther King's personal activities, and then using that secret evidence in attempts at blackmail or intimidation, a devastating charge given King's subsequent elevation to secular sainthood. However, none of these accounts ever reveal that it was actually ADL operatives who were spying on King and bugging his hotel rooms, then passing their tapes on to Hoover, who merely listened to them.

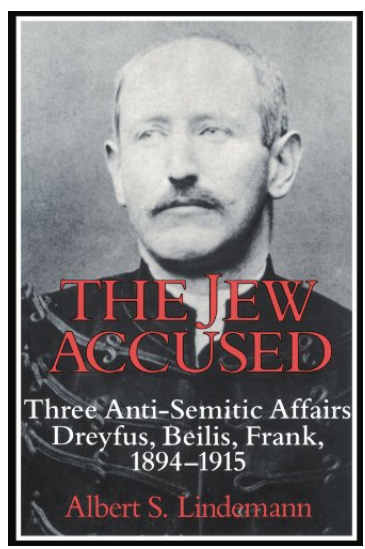
And that telling example of illegal 1960s ADL surveillance represents merely the smallest tip of the organization's enormous domestic espionage activities, which have been directed against all individuals or organizations—left, right, or center—suspected of being insufficiently favorable toward Israel or Jews. By the time the FBI and local police departments broke a massive ADL spying operation in the early 1990s, the ADL was reported to be maintaining intelligence files on over one million Americans, a level of private domestic surveillance surely unequaled in our entire national history, with even some suggestions of possible involvement in political assassinations and terrorist attacks. But since the media quickly suppressed news of the scandal and the organization was punished with merely a slight slap on the wrist, there seems every likelihood that ADL spying activities on ordinary Americans have actually metastasized since that point in time.

In effect, the ADL seems to function as a privatized version of our secret political police, seeking to maintain the power of the

interlocking Jewish groups that dominate our society, much like the Stasi did on behalf of East Germany's ruling Communist regime.

But for me, the most remarkable ADL revelation came in a book I purchased last year on Amazon, a book Amazon has now banned from sale. It seems that the ADL's very origin story of one hundred years ago, frequently mentioned in my introductory history textbooks and which I had never previously questioned, actually represented an absolute inversion of historical reality. As I wrote:

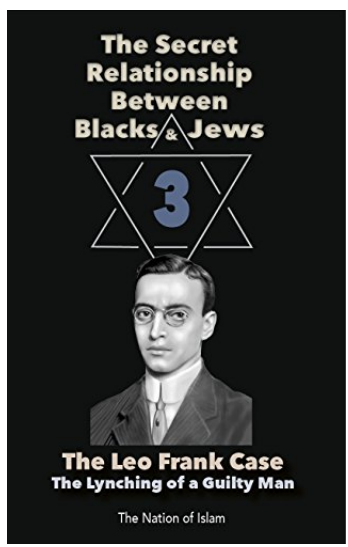
> Then perhaps a year or two ago, I happened to come across some discussion of the ADL's 2013 centenary celebration, in which the leadership reaffirmed the principles of its 1913 founding. The initial impetus had been the vain national effort to save the life of Leo Frank, a young Southern Jew unjustly accused of murder and eventually lynched. Not long before, Frank's name and story would have been equally vague in my mind, with the man half-remembered from my introductory history textbooks as one of the most notable early KKK victims in the fiercely anti-Semitic Deep South of the early twentieth century. However, not long before seeing that piece on the ADL I'd read Albert Lindemann's highly-regarded study *The Jew Accused*, and his short chapter on the notorious Frank case had completely exploded all my preconceptions.



> First, Lindemann demonstrated that there was no evidence of any anti-Semitism behind Frank's arrest and conviction, with Jews constituting a highly-valued element of the affluent Atlanta society of the day, and no references to Frank's Jewish

background, negative or otherwise, appearing in the media prior to the trial. Indeed, five of the Grand Jurors who voted to indict Frank for murder were themselves Jewish, and none of them ever voiced regret over their decision. In general, support for Frank seems to have been strongest among Jews from New York and other distant parts of the country and weakest among the Atlanta Jews with best knowledge of the local situation.

Furthermore, although Lindemann followed the secondary sources he relied upon in declaring that Frank was clearly innocent of the charges of rape and murder, the facts he recounted led me to the opposite conclusion, seeming to suggest strong evidence of Frank's guilt. When I much more recently read Lindemann's longer and more comprehensive historical study of anti-Semitism, *Esau's Tears*, I noticed that his abbreviated treatment of the Frank case no longer made any claim of innocence, perhaps indicating that the author himself might have also had second thoughts about the weight of the evidence.



Since I had had the impression that virtually all researchers who had investigated the Frank case had concluded that he was innocent of the rape and murder of 13-year-old Mary Phagan, I regarded my own contrary opinion as very tentative. But then someone pointed me to a 2016 book from an unexpected source that argued for Frank's guilt. With some doubts, I clicked a couple of Amazon buttons and ordered the volume, written by the unnamed researchers of Louis Farrakhan's Nation of Islam (NOI). As I explained at considerable length:

Anonymous works published by heavily-demonized religious-

political movements naturally engender considerable caution, but once I began reading the 500 pages of *The Leo Frank Case: The Lynching of a Guilty Man* I was tremendously impressed by the quality of the historical analysis. I think I have only very rarely encountered a research monograph on a controversial historical event that provided such an enormous wealth of carefully-argued analysis backed by such copious evidence. The authors seemed to display complete mastery of the major secondary literature of the last one hundred years while drawing very heavily upon the various primary sources, including court records, personal correspondence, and contemporaneous publications, with the overwhelming majority of the 1200 footnotes referencing newspaper and magazine articles of that era. The case they made for Frank's guilt seemed absolutely overwhelming.

The facts of the case against Frank eventually became a remarkable tangle of complex and often conflicting evidence and eyewitness testimony, with sworn statements regularly being retracted and then counter-retracted. But the crucial point that the NOI authors emphasize for properly deciphering this confusing situation is the enormous scale of the financial resources that were deployed on Frank's behalf, both prior to the trial and afterward, with virtually all of the funds coming from Jewish sources. Currency conversions are hardly precise, but relative to the American family incomes of the time, the total expenditures by Frank supporters may have been as high as $25 million in present-day dollars, quite possibly more than any other homicide defense in American history before or after, and an almost unimaginable sum for the impoverished Deep South of that period. Years later, a leading donor privately admitted that much of this money was spent on perjury and similar falsifications, something which is very readily apparent to anyone who closely studies the case. When we consider this vast ocean of pro-Frank funding and the sordid means for which it was often deployed, the details of the case become far less mysterious. There exists a mountain of demonstrably fabricated evidence and false testimony in favor of Frank, and no sign of anything similar on the other side.

The police initially suspected the black night watchman who found the girl's body, and he was quickly arrested and harshly interrogated. Soon afterward, a bloody shirt was found at his home, and Frank made several statements that seemed to implicate his employee in the crime. At one point, this black suspect may have come close to being summarily lynched by a

mob, which would have closed the case. But he stuck to his story of innocence with remarkable composure, in sharp contrast to Frank's extremely nervous and suspicious behavior, and the police soon shifted their scrutiny toward the latter, culminating in his arrest. All researchers now recognize that the night watchman was entirely innocent, and the material against him planted.

As the investigation moved forward, a major break occurred as a certain Jim Conley, Frank's black janitor, came forward and confessed to having been Frank's accomplice in concealing the crime. At the trial he testified that Frank had regularly enlisted him as a lookout during his numerous sexual liaisons with his female employees, and after murdering Phagan, had then offered him a huge sum of money to help remove and hide the body in the basement so that the crime could be pinned upon someone else. But with the legal noose tightening around Frank, Conley had begun to fear that he might be made the new scapegoat, and went to the authorities in order to save his own neck. Despite Conley's damning accusations, Frank repeatedly refused to confront him in the presence of the police, which was widely seen as further proof of Frank's guilt.

By the time of the trial itself, all sides were agreed that the murderer was either Frank, the wealthy Jewish businessman, or Conley, the semi-literate black janitor with a first-grade education and a long history of public drunkenness and petty crime. Frank's lawyers exploited this comparison to the fullest, emphasizing Frank's Jewish background as evidence for his innocence and indulging in the crudest sort of racial invective against his black accuser, whom they claimed was obviously the true rapist and murderer due to his bestial nature.

Taking a broader overview, the theory advanced by Frank's legion of posthumous advocates seems to defy rationality. These journalists and scholars uniformly argue that Conley, a semi-literate black menial, had brutally raped and murdered a young white girl, and the legal authorities soon became aware of this fact, but conspired to set him free by supporting a complex and risky scheme to instead frame an innocent white businessman. Can we really believe that the police officials and prosecutors of a city in the Old South would have violated their oath of office in order to knowingly protect a black rapist and killer from legal punishment and thereby turn him loose upon their city streets, presumably to prey on future young white girls? This implausible reconstruction is particularly bizarre in that nearly all its

advocates across the decades have been the staunchest of Jewish liberals, who endlessly condemned the horrific racism of the Southern authorities of that era, but then unaccountably chose to make a special exception in this one particular case.

The NOI authors devote nearly all of their lengthy book to a careful analysis of the Frank case provided in suitably dispassionate form, but a sense of their justifiable outrage does occasionally poke through. In the years prior to Frank's killing, many thousands of black men throughout the South had been lynched, often based on a slender thread of suspicion, with few of these incidents receiving more than a few sentences of coverage in a local newspaper, and large numbers of whites had also perished in similar circumstances. Meanwhile, Frank had received benefit of the longest trial in modern Southern history, backed by the finest trial lawyers that money could buy, and based on overwhelming evidence had been sentenced to death for the rape and murder of a young girl. But when Frank's legal verdict was carried out by extra-judicial means, he immediately became the most famous lynching victim in American history, perhaps even attracting more media attention than all those thousands of other cases combined. Jewish money and Jewish media established him as a Jewish martyr who thereby effectively usurped the victimhood of the enormous number of innocent blacks who were killed both before and after him, none of whom were ever even recognized as individuals.

The NOI authors note that prior to Frank's trial American history had been virtually devoid of any evidence of significant anti-Semitism, with the previous most notable incident being the case of an extremely wealthy Jewish financier who was refused service at a fancy resort hotel. But by totally distorting the Frank case and focusing such massive national media coverage on his plight, Jewish leaders around the country succeeded in fabricating a powerful ideological narrative despite its lack of reality, perhaps intending the story to serve as a bonding experience to foster Jewish community cohesion.

Let us summarize what seems to be the solidly established factual history of the Frank case, quite different than the traditional narrative. There is not the slightest evidence that Frank's Jewish background was a factor behind his arrest and conviction, nor the death sentence he received. The case set a remarkable precedent in Southern courtroom history with the testimony of a black man playing a central role in a white man's conviction. From the

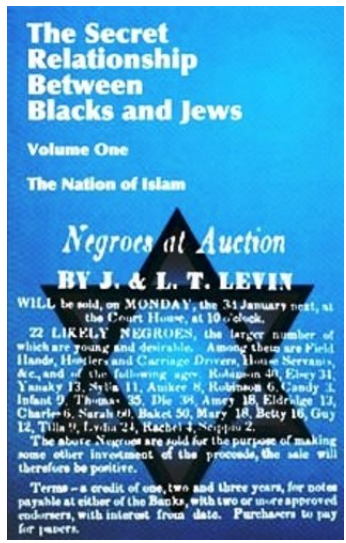
> earliest stages of the murder investigation, Frank and his allies continually attempted to implicate a series of different innocent blacks by planting false evidence and using bribes to solicit perjured testimony, while the exceptionally harsh racial rhetoric that Frank and his attorneys directed towards those blacks was presumably intended to provoke their public lynching. Yet despite all these attempts by the Frank forces to play upon the notorious racial sentiments of the white Southerners of that era, the latter saw through these schemes and Frank was the one sentenced to hang for his rape and murder of that young girl.
>
> Now suppose that all the facts of this famous case were exactly unchanged except that Frank had been a white Gentile. Surely the trial would be ranked as one of the greatest racial turning points in American history, perhaps even overshadowing *Brown v. Board* because of the extent of popular sentiment, and it would have been given a central place in all our modern textbooks. Meanwhile, Frank, his lawyers, and his heavy financial backers would probably be cast as among the vilest racial villains in all of American history for their repeated attempts to foment the lynching of various innocent blacks so that a wealthy white rapist and murderer could walk free. But because Frank was Jewish rather than Christian, this remarkable history has been completely inverted for over one hundred years by our Jewish-dominated media and historiography.

Prior to the creation of the Internet and the establishment of Amazon's book-selling operation, this fascinating history would have remained completely unknown to me. Given its influential political role in our society, the ADL would certainly be concerned if it became widely known that the organization was founded with the central mission of ensuring that no wealthy and powerful Jew ever suffered punishment for the rape and murder of a young Christian girl, nor for trying to orchestrate the lynching of innocent black men in order to cover his own guilt.

When I published my original article in October, I naturally encouraged readers to order the remarkable book in question and decide for themselves. But Amazon has now chosen to ban that book of outstanding black historical scholarship at the height of Black History Month, a step taken just a few days after the ADL President made his annual glowing tribute to that national celebration of black pride. Those interested can still read my lengthy analysis of that book and the important historical event it describes.

- American Pravda: The ADL in American Society
  Ron Unz • October 15, 2018 • 7,300 Words

The true circumstances surrounding the establishment of the ADL is not the only work of serious historical scholarship to have suddenly been removed from Amazon's shelves, and most of the others seem to follow a very consistent pattern, certainly suggesting the hand of that organization and its kindred spirits.

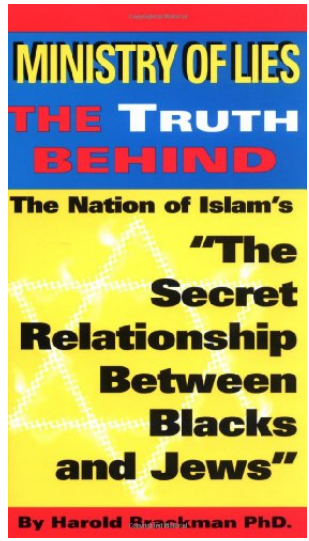


The Secret Relationship Between Blacks and Jews
Volume One
The Nation of Islam
Negroes at Auction
BY J. & L. T. LEVIN
WILL be sold, on MONDAY, the 31 January next, at the Court House, at 10 o'clock,
22 LIKELY NEGROES, the larger number of which are young and desirable. Among them are Field Hands, Hostlers and Carriage Drivers, House Servants, &c., and of the following ages. Robinson 40, Elsey 31, Yanaky 13, Sylla 11, Anker 8, Robinson 6, Candy 2, Infant 9, Thomas 35, Dic 30, Amey 18, Eldridge 15, Charles 6, Sarah 60, Baket 50, Mary 18, Betty 16, Guy 12, Tilla 9, Lydia 24, Rachel 4, Seppio 2.
The above Negroes are sold for the purpose of making some other investment of the proceeds, the sale will therefore be positive.
Terms—a credit of one, two and three years, for notes payable at either of the Banks, with two or more approved endorsers, with interest from date. Purchasers to pay for papers.

For more than a half-century, Jewish political activists and engaged academics have pilloried white American society for its longstanding mistreatment of blacks, especially focusing upon the "original sin" of black slavery, and almost every morning my *New York Times* carries one or more articles filled with such denunciations. Americans of Anglo-Saxon founding stock are invariably portrayed as the villains of the story, with American Jews frequently cited as among the heroic supporters of the Civil Rights Movement that eventually rectified some of those injustices.

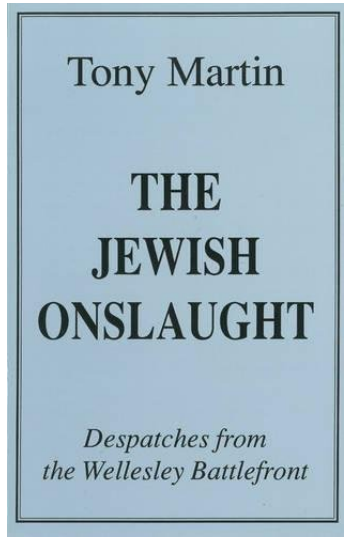
Yet just as in the case of Leo Frank, the true facts may be somewhat more complex. Over a quarter-century ago, the same group of provocative NOI researchers published a fascinating volume gathering together a huge quantity of historical evidence suggesting that prior to the Civil War, America's tiny Jewish population had actually played an enormously disproportionate role in establishing and promoting black slavery, with their co-ethnics sometimes even dominating that institution in the vast and exceptionally cruel slave plantations of Latin America, which were frequently operated like death-camps. These claims are hardly so implausible given that slave-trading had

been a very traditional Jewish occupation in much of Europe and the Middle East for the last thousand years, and it is probably more than coincidence that the largest centers of Jewish settlement in Colonial America tended to be those cities focused on the slave trade.



I am hardly a specialist in pre-Civil War history, and weighing the strength of the evidence presented is beyond my expertise. But I did also order and read an angry rebuttal book published a couple of years later by a Dr. Harold Brackman, a Jewish historian working under the auspices of the Simon Wiesenthal Center, and found his arguments quite thin and unpersuasive.

Under normal circumstances, scholars of varied opinions would debate this controversial thesis back and forth and eventually come to some conclusion. But when Tony Martin, a prominent black scholar at Wellesley, merely put the provocative book on the reading list of one of his black history courses, he was ferociously vilified in the media and saw his career ruined, with concerted efforts made to fire him despite his tenured position. He later recounted the situation he faced in a short book.



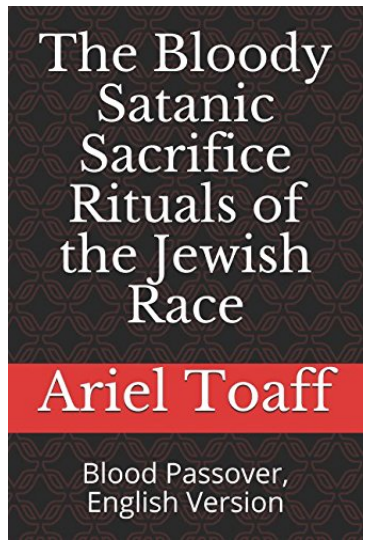
I briefly mentioned the study and its thesis in a July article and suggested those intrigued by the dispute order it from Amazon and evaluate the evidence for themselves. Alas, that is no longer possible since Amazon has now banned the work, although all the subsequent books rebutting the thesis or discussing the huge controversy it aroused are still freely available. This strongly suggests that the evidence presented of a massive Jewish role in black slavery was simply too compelling to be easily refuted.

These anonymous black research studies prepared under the auspices of the Nation of Islam are hardly alone among serious historical texts now banned by Amazon. Indeed, groundbreaking works by eminent Jewish scholars may now also suffer a similar fate if they stray into forbidden territory. As I wrote at length last year:

> I do not doubt that much of the candid analysis provided above will be quite distressing to many individuals. Indeed, some may believe that such material far exceeds the boundaries of mere anti-Semitism and easily crosses the threshold into constituting an actual blood libel against the Jewish people. That extremely harsh accusation, widely used by stalwart defenders of Israeli behavior, refers to the notorious Christian superstition, prevalent throughout most of the Middle Ages and even into more modern times, that Jews sometimes kidnapped small Christian children in order to drain their blood for use in various magic rituals, especially in connection with the Purim religious holiday. One of my more shocking discoveries of the last

dozen years is that there is a fairly strong likelihood that these seemingly impossible beliefs were actually true.

I personally have no professional expertise whatsoever in Jewish ritual traditions, nor the practices of Medieval Jewry. But one of the world's foremost scholars in that field is Ariel Toaff, professor of Jewish Renaissance and Medieval Studies at Bar-Ilan University near Tel Aviv, and himself the son of the Chief Rabbi of Rome.



In 2007, he published the Italian edition of his academic study *Blood Passovers*, based on many years of diligent research, assisted by his graduate students and guided by the suggestions of his various academic colleagues, with the initial print run of 1,000 copies selling out on the first day. Given Toaff's international eminence and such enormous interest, further international distribution, including an English edition by a prestigious American academic press would normally have followed. But the ADL and various other Jewish-activist groups regarded such a possibility with extreme disfavor, and although these activists lacked any scholarly credentials, they apparently applied sufficient pressure to cancel all additional publication. Although Prof. Toaff initially attempted to stand his ground in stubborn fashion, he soon took the same course as Galileo, and his apologies naturally became the basis of the always-unreliable Wikipedia entry on the topic.

It appears that a considerable number of Ashkenazi Jews traditionally regarded Christian blood as having powerful magical properties and considered it a very valuable component of certain

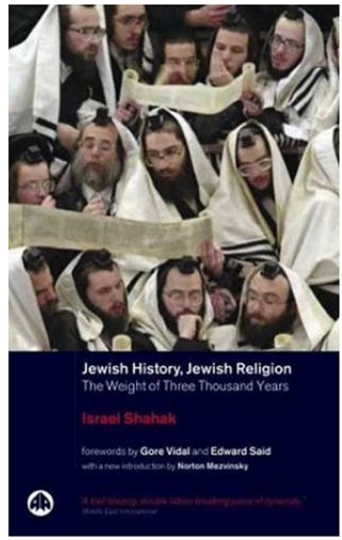
important ritual observances at particular religious holidays. Obviously, obtaining such blood in large amounts was fraught with considerable risk, which greatly enhanced its monetary value, and the trade in the vials of this commodity seems to have been widely practiced.

Obviously, the ritual murder of Christian children for their blood was viewed with enormous disfavor by the local Gentile population, and the widespread belief in its existence remained a source of bitter tension between the two communities, flaring up occasionally when a Christian child mysteriously disappeared at a particular time of year, or when a body was found that exhibited suspicious types of wounds or showed a strange loss of blood. Every now and then, a particular case would reach public prominence, often leading to a political test of strength between Jewish and anti-Jewish groups. During the mid-19th century, there was one such famous case in French-dominated Syria, and just before the outbreak of the First World War, Russia was wracked by a similar political conflict in the 1913 Beilis Affair in the Ukraine.

I first encountered these very surprising ideas almost a dozen years ago in a long article by Israel Shamir that was referenced in *Counterpunch*, and this would definitely be worth reading as an overall summary, together with a couple of his follow-up columns, while writer Andrew Hamilton offers the most recent 2012 overview of the controversy. Shamir also helpfully provides a free copy of the book in PDF form, an updated version with the footnotes properly noted in the text. Anyway, I lack the expertise to effectively judge the likelihood of the Toaff Hypothesis, so I would invite those interested to read Toaff's book or better yet the related articles and decide for themselves.

Amazon has now banned the English translation of Prof. Toaff's astonishing book, though it is still available on the Internet in PDF form at the link provided above.

All of these almost unprecedented Amazon book bannings occurred just in the last couple of weeks, and unless they are soon reversed, they may become just the first of many. The 1990s volumes on Judaism written by the late Israel Shahak, an award-winning professor at Hebrew University in Israel, might also be headed for oblivion. As I wrote last year:



Jewish History, Jewish Religion
The Weight of Three Thousand Years
Israel Shahak
forewords by Gore Vidal and Edward Said
with a new introduction by Norton Mezvinsky

Although Shahak's books are quite short, they contain such a density of astonishing material, it would take many, many thousands of words to begin to summarize them. Essentially almost everything I had known—or thought I had known—about the religion of Judaism, at least in its zealously Orthodox traditional form, was utterly wrong.

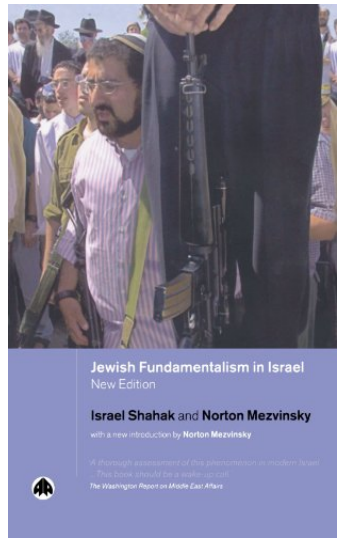
On the most basic level, the religion of most traditional Jews is actually not at all monotheistic, but instead contains a wide variety of different male and female gods, having quite complex relations to each other, with these entities and their properties varying enormously among the numerous different Jewish sub-sects, depending upon which portions of the Talmud and the Kabala they place uppermost. For example, the traditional Jewish religious cry "The Lord Is One" has always been interpreted by most people to be an monotheistic affirmation, and indeed, many Jews take exactly this same view. But large numbers of other Jews believe this declaration instead refers to achievement of sexual union between the primary male and female divine entities. And most bizarrely, Jews having such radically different views see absolutely no difficulty in praying side by side, and merely interpreting their identical chants in very different fashion.

Furthermore, religious Jews apparently pray to Satan almost as readily as they pray to God, and depending upon the various rabbinical schools, the particular rituals and sacrifices they practice may be aimed at enlisting the support of the one or the

other. Once again, so long as the rituals are properly followed, the Satan-worshippers and the God-worshippers get along perfectly well and consider each other equally pious Jews, merely of a slightly different tradition. One point that Shahak repeatedly emphasizes is that in traditional Judaism the nature of the ritual itself is absolutely uppermost, while the interpretation of the ritual is rather secondary. So perhaps a Jew who washes his hands three times clockwise might be horrified by another who follows a counter-clockwise direction, but whether the hand-washing were meant to honor God or to honor Satan would be hardly be a matter of much consequence.

If these ritualistic issues constituted the central features of traditional religious Judaism, we might regard it as a rather colorful and eccentric survival of ancient times. But unfortunately, there is also a far darker side, primarily involving the relationship between Jews and non-Jews, with the highly derogatory term *goyim* frequently used to describe the latter. To put it bluntly, Jews have divine souls and *goyim* do not, being merely beasts in the shape of men. Indeed, the primary reason for the existence of non-Jews is to serve as the slaves of Jews, with some very high-ranking rabbis occasionally stating this well-known fact. In 2010, Israel's top Sephardic rabbi used his weekly sermon to declare that the only reason for the existence of non-Jews is to serve Jews and do work for them. The enslavement or extermination of all non-Jews seems an ultimate implied goal of the religion.

Jewish lives have infinite value, and non-Jewish ones none at all, which has obvious policy implications. For example, in a published article a prominent Israeli rabbi explained that if a Jew needed a liver, it would be perfectly fine, and indeed obligatory, to kill an innocent Gentile and take his. Perhaps we should not be too surprised that today Israel is widely regarded as one of the world centers of organ-trafficking.



Jewish Fundamentalism in Israel
New Edition
Israel Shahak and Norton Mezvinsky
with a new introduction by Norton Mezvinsky
The Washington Report on Middle East Affairs

As a further illustration of the seething hatred traditional Judaism radiates towards all those of a different background, saving the life of a non-Jew is generally considered improper or even prohibited, and taking any such action on the Sabbath would be an absolute violation of religious edict. Such dogmas are certainly ironic given the widespread presence of Jews in the medical profession during recent centuries, but they came to the fore in Israel when a religiously-minded military doctor took them to heart and his position was supported by the country's highest religious authorities.

And while religious Judaism has a decidedly negative view towards all non-Jews, Christianity in particular is regarded as a total abomination, which must be wiped from the face of the earth.

Whereas pious Muslims consider Jesus as the holy prophet of God and Muhammed's immediate predecessor, according to the Jewish Talmud, Jesus is perhaps the vilest being who ever lived, condemned to spend eternity in the bottommost pit of Hell, immersed in a boiling vat of excrement. Religious Jews regard the Muslim Quran as just another book, though a totally mistaken one, but the Christian Bible represents purest evil, and if circumstances permit, burning Bibles is a very praiseworthy act. Pious Jews are also enjoined to always spit three times at any cross or church they encounter, and direct a curse at all Christian cemeteries. Indeed, many deeply religious Jews utter a prayer each and every day for the immediate extermination of all Christians.

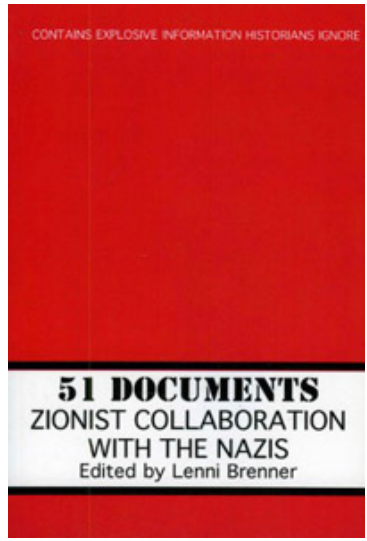
> Over the years prominent Israeli rabbis have sometimes publicly debated whether Jewish power has now become sufficiently great that all the Christian churches of Jerusalem, Bethleham, and other nearby areas can finally be destroyed, and the entire Holy Land completely cleansed of all traces of its Christian contamination. Some have taken this position, but most have urged prudence, arguing that Jews needed to gain some additional strength before they should take such a risky step. These days, many tens of millions of zealous Christians and especially Christian Zionists are enthusiastic advocates for Jews, Judaism, and Israel, and I strongly suspect that at least some of that enthusiasm is based upon ignorance.

Shahak's scholarly research received glowing praise from some of America's most prominent public intellectuals, including Christopher Hitchens, Gore Vidal, Noam Chomsky, and Edward Said, as well as prestigious publications such as *The London Review of Books* and *Middle East International*. But given the political implications of his revelations, I suspect they will soon only be available on scattered websites across the Internet.

A more detailed discussion of the works of Profs. Toaff and Shahak on these lesser-known aspects of the Jewish religion can be found in my long article from last July:

- American Pravda: Oddities of the Jewish Religion
  Ron Unz • July 16, 2018 • 7,800 Words

Other Amazon books seem to have recently fallen into limbo, still being sold by that website, but hidden away so that most readers would never discover them.



More than thirty-five years ago, Lenni Brenner, a Jewish leftist of anti-Zionist sympathies, published his ground-breaking research revealing the extensive Nazi-Zionist economic partnership of the 1930s, which laid the basis for the creation of the State of Israel. Although our media has almost entirely ignored that fascinating history, subsequent studies have fully confirmed Brenner's central framework.

I myself only became aware of Brenner's book last year and immediately purchased it on Amazon, then published an article in which I discussed his important findings:

> Although the Germans paid little attention to the entreaties of that minor organization, the far larger and more influential mainstream Zionist movement of Chaim Weizmann and David Ben-Gurion was something else entirely. And during most of the 1930s, these other Zionists had formed an important economic partnership with Nazi Germany, based upon an obvious commonality of interests. After all, Hitler regarded Germany's one percent Jewish population as a disruptive and potentially dangerous element which he wanted gone, and the Middle East seemed as good a destination for them as any other. Meanwhile, the Zionists had very similar objectives, and the creation of their new national homeland in Palestine obviously required both Jewish immigrants and Jewish financial investment.
>
> The importance of the Nazi-Zionist pact for Israel's establishment is difficult to overstate. According to a 1974 analysis in *Jewish Frontier* cited by Brenner, between 1933 and 1939 over 60% of all the investment in Jewish Palestine came from Nazi Germany. The

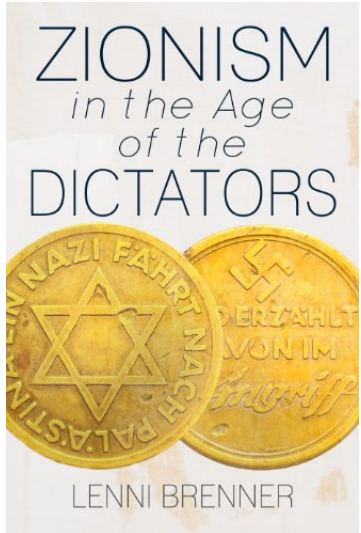
worldwide impoverishment of the Great Depression had drastically reduced ongoing Jewish financial support from all other sources, and Brenner reasonably suggests that without Hitler's financial backing, the nascent Jewish colony, so tiny and fragile, might easily have shriveled up and died during that difficult period.

Such a conclusion leads to fascinating hypotheticals. When I first stumbled across references to the *Ha'avara* Agreement on websites here and there, one of the commenters mentioning the issue half-jokingly suggested that if Hitler had won the war, statues would surely have been built to him throughout Israel and he would today be recognized by Jews everywhere as the heroic Gentile leader who had played the central role in reestablishing a national homeland for the Jewish people in Palestine after almost 2000 years of bitter exile.

This sort of astonishing counter-factual possibility is not nearly as totally absurd as it might sound to our present-day ears. We must recognize that our historical understanding of reality is shaped by the media, and media organs are controlled by the winners of major wars and their allies, with inconvenient details often excluded to avoid confusing the public.

Once Hitler consolidated power in Germany, he quickly outlawed all other political organizations for the German people, with only the Nazi Party and Nazi political symbols being legally permitted. But a special exception was made for German Jews, and Germany's local Zionist Party was accorded complete legal status, with Zionist marches, Zionist uniforms, and Zionist flags all fully permitted. Under Hitler, there was strict censorship of all German publications, but the weekly Zionist newspaper was freely sold at all newsstands and street corners. The clear notion seemed to be that a German National Socialist Party was the proper political home for the country's 99% German majority, while Zionist National Socialism would fill the same role for the tiny Jewish minority.

In 1934, Zionist leaders invited an important SS official to spend six months visiting the Jewish settlement in Palestine, and upon his return, his very favorable impressions of the growing Zionist enterprise were published as a massive 12-part-series in Joseph Goebbel's *Der Angriff*, the flagship media organ of the Nazi Party, bearing the descriptive title "A Nazi Goes to Palestine."



Just last year, the Brenner books I purchased immediately popped up on the Amazon website, but these days they are hidden away, not even appearing on his nearly empty author page. One suspects that the ADL or similar organizations are very reluctant to have readers discover Brenner's extensive collection of primary source documents or the paperback edition of his historical narrative, whose cover shows the commemorative medal struck by Nazi Germany to mark its Zionist alliance, displaying the Swastika on one side and the Jewish Star-of-David on the other. Those interested in the entire complex and rather surprising historical relationship between Jews and the Third Reich during its dozen years of existence should consider reading my article on the subject.

- American Pravda: Jews and Nazis
  Ron Unz • August 6, 2018 • 6,800 Words

Jews today constitute less than 1% of the combined population of North America and the European Union, yet any honest observer would have to admit that organized Jewish groups totally dominate the politics and public life of those once-proud nations, which during past centuries had ruled most of the world.

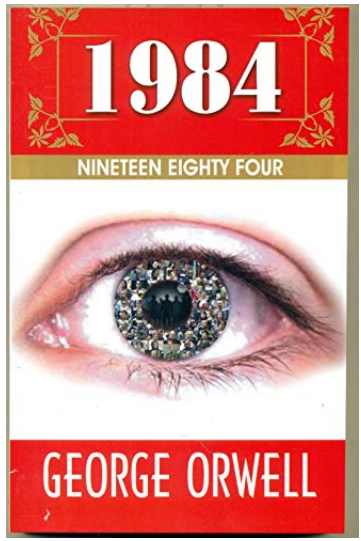
The primary factor behind this astonishing control now exercised over populations that are 99% non-Jewish is probably the powerful leverage Jews today hold over money and media. But an important secondary factor has been the gradual elevation of the Jewish Holocaust of World War II into the status of a near-sacred doctrine,

largely replacing traditional Christianity as an official state religion, with dissenters generally treated as heretics and frequently subjected to government prosecution or imprisonment. Indeed, it seems that virtually every morning my newspapers are filled with Holocaust articles, most of them written with the same sort of sacred reverence that Catholic newspapers a century ago might have given to discussions of the Virgin Birth. However, because this so-called "Holocaustianity" purports to be a secular faith, it remains vulnerable to dispute on factual grounds, and many have suggested that its collapse would strike a mortal blow against reigning Jewish power.

The ADL and other Jewish activist organizations certainly seem extremely reluctant to take that risk. We should hardly be surprised that the first great large wave of Amazon book-bannings was the early 2017 purge of many dozens of scholarly texts by revisionist historians who had argued at great length and in considerable detail that the Holocaust was largely a hoax, concocted by Jewish activists and Hollywood filmmakers as a powerful shield against any criticism of Jewish or Israeli misbehavior. Although many of these books are still available for sale by their publisher, their complete disappearance from Amazon has greatly reduced their potential distribution.

Fortunately, I had purchased copies of several such books while Amazon still stocked them, and last year I published a long article summarizing my own conclusions about that complex and highly contentious topic. Although I am hardly an expert, it seemed to me that there was an enormous amount of persuasive evidence that the Holocaust is indeed substantially fraudulent, and quite possibly, almost entirely so. Those interested in considering my reasoning are welcome to do so and decide for themselves.

- American Pravda: Holocaust Denial
  Ron Unz • August 27, 2018 • 17,600 Words



Probably the most famous dystopian novel of the last one hundred years is George Orwell's 1984, and perhaps its most memorable observation is that those who control the past control the future and those who control the present control the past. We should recognize that serious books constitute the congealed nature of that past.

Our electronic media and its new social offshoot may dominate the thoughts of our population, and perhaps a single Tweet by a third-tier political celebrity might attract more readers in an hour than all the books discussed in this article have drawn in a year. But while effervescent, such electronic media emanations are transitory and fleeting, and quite likely to be forgotten an hour later. Meanwhile, serious books of ideas and scholarship have the potential to permanently reshape the contours of the reality accepted by the sort of individuals who may eventually alter our society. During a heated national election campaign, billions of dollars may be expended to temporarily shift public opinion on some issue or candidate, but a few weeks later, the effect has usually dissipated. Books may cost just a few dollars, but their potential impact is of a different order of weight and permanency.

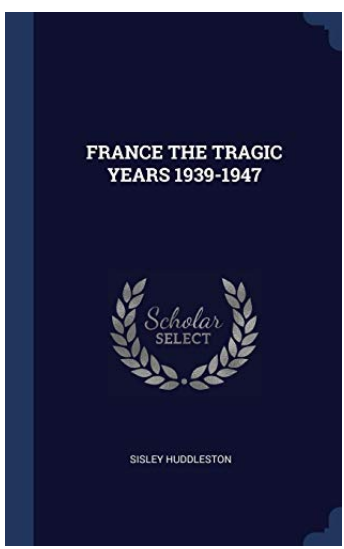
Amazon today possesses a near-total monopoly over Internet book sales, and if American society continues to allow it to ban serious works of scholarship on political or ideological grounds, our future intellectual freedom has already been lost.

# How Hitler Saved the Allies

May 13, 2019 • 8,300 Words

A couple of years ago I happened to be reading the World War II memoirs of Sisley Huddleston, an American journalist living in France. Although long since forgotten, Huddleston had spent decades as one of our most prominent foreign correspondents, and dozens of his major articles had appeared in *The Atlantic Monthly*, *The New Republic*, and *Harpers*, while he had authored some nineteen books. Given such eminence, his personal relationships reached far into elite circles, with one of his oldest and closest friends being William Bullitt, the American ambassador to France, who had previously opened our first Soviet embassy under FDR.

Huddleston's credibility seemed impeccable, which is why I was so shocked at his firsthand account of wartime Vichy, totally contrary to what I had absorbed from my introductory history textbooks. While I had always had the impression that Petain's collaborationist regime possessed little legitimacy, this was not at all the case. Near unanimous majorities of both houses of the duly-elected French parliament had voted the elderly field marshal into office despite his own deep personal misgivings, regarding him as France's only hope of a unifying national savior following the country's crushing 1940 defeat at Hitler's hands.



Although Huddleston's sympathies were hardly with the Germans, he

noted the scrupulous correctness they exhibited following their overwhelming victory, policies that continued throughout the early years of the Occupation. And although he had on a couple of occasions performed minor services for the nascent Resistance movement, when the 1944 Normandy landings and the subsequent German withdrawal suddenly opened the doors of power to the anti-Petain forces, they engaged in an orgy of ideological bloodletting far surpassing the infamous Reign of Terror of the French Revolution and probably without precedent in French history, with perhaps 100,000 or more civilians being summarily butchered on the basis of little or no evidence, often just to settle personal scores. Some of the worst of the bloodshed came at the hands of the Communist exiles of the Spanish Civil War, who had found shelter in France after their defeat and now eagerly took the opportunity to turn the tables and massacre the same sort of "bourgeois" class-enemies who had defeated them in that previous conflict just a few years earlier.

As I sought to weigh Huddleston's testimony against the traditional narrative of wartime France I had always fully accepted, most of the factors seemed to point in his favor. After all, his journalistic credentials were impeccable and as a very well-connected direct observer of the events he reported, his statements surely counted for a great deal. Meanwhile, it appeared that most of the standard narrative dominating our history books had been constructed a generation or so later by writers living on the other side of the Atlantic ocean, whose conclusions may have been substantially influenced by the black-and-white ideological framework that had by then become rigidly enshrined at elite American universities.

However, I couldn't help noticing one huge, gaping flaw in Huddleston's account, an error so serious that it cast grave doubts upon his entire credibility as a journalist. Towards the beginning of his book, he devotes a page or so to casually mentioning that in the early months of 1940, the French and British were preparing to launch an attack against the neutral Soviet Union, using their bases in Syria and Iraq for a strategic bombing offensive meant to destroy Stalin's Baku oil fields of the Caucasus, one of the world's leading sources of that vital commodity.

Obviously, every military organization produces a wealth of hypothetical contingency plans covering all possible situations and opponents, but Huddleston had somehow misunderstood such possibilities or rumors as outright fact. According to him, the Allied bombing of the Soviet Union had been scheduled to begin March 15th, but was initially delayed and rescheduled for various political

reasons. Then a few weeks later, the German panzer divisions swept through the Ardennes forest, surrounded the French armies, and captured Paris, aborting the planned Allied bombardment of Russia.

Given that the USSR played the leading role in Germany's eventual defeat, an early Allied attack upon the Soviet homeland would surely have changed the outcome of the war. Although Huddleston's bizarre fantasies had somehow gotten the best of him, he was hardly incorrect in exclaiming "What a narrow escape!"

The notion that the Allies were preparing to launch a major bombing offensive against the Soviet Union just a few months after the outbreak of World War II was obviously absurd, so ridiculous a notion that not a hint of that long-debunked rumor had ever gotten into the standard history texts I had read on the European conflict. But for Huddleston to have still clung to such nonsensical beliefs even several years after the end of the war raised large questions about his gullibility or even his sanity. I wondered whether I could trust even a single word he said about anything else.

However, not long afterward I encountered quite a surprise in a 2017 article published in *The National Interest*, an eminently respectable periodical. The short piece carried the descriptive headline "In the Early Days of World War II, Britain and France Planned to Bomb Russia." The contents absolutely flabbergasted me, and with Huddleston's credibility now fully established—and the credibility of my standard history textbooks equally demolished—I went ahead and substantially drew upon his account for my long article "American Pravda: Post-War France and Post-War Germany."

- American Pravda: Post-War France and Post-War Germany
  Ron Unz • July 9, 2018 • 6,600 Words

I hardly regard myself as a specialist on the history of World War II, but I initially felt deeply embarrassed to have spent my entire life completely ignorant of that crucial early turning-point in the huge conflict. However, once I had carefully read that *National Interest* article, my shame quickly dissipated, for the it was obvious that the author, Michael Peck, along with his editors and readers had been equally unaware of those long-buried facts. Indeed, the article had originally run in 2015, but was republished a couple of years later due to enormous reader demand. As near as I can tell, that single 1100 word essay constituted the first and only time those momentous

events described had received significant public attention in the seventy years since the end of the war.

Peck's discussion greatly fleshed out Huddleston's brief, offhand remarks. The French and British high commands had prepared their enormous bomber offensive, *Operation Pike*, in hopes of destroying Russia's oil resources, and their unmarked reconnaissance flights had already overflown Baku, photographing the locations of the intended targets. The Allies were convinced that the best strategy for defeating Germany was to eliminate its sources of oil and other vital raw materials, and with Russia being Hitler's leading supplier, they decided that destroying the Soviet oil fields seemed a logical strategy.

However, Peck emphasized the severe errors in this reasoning. In actual fact, only a small fraction of Hitler's oil came from Russia, so the true impact of even an entirely successful campaign would have been low. And although the Allied commanders were convinced that weeks of continuous bombardment—apparently representing the world's largest strategic-bombing campaign to that date—would quickly eliminate all Soviet oil production, later events in the war suggested that those projections were wildly optimistic, with vastly larger and more powerful aerial attacks generally inflicting far less permanent destruction than expected. So the damage to the Soviets would probably not have been great, and the resulting full military alliance between Hitler and Stalin would surely have reversed the outcome of the war. This was reflected in the original 2015 title of the same article "Operation Pike: How a Crazy Plan to Bomb Russia Almost Lost World War II."

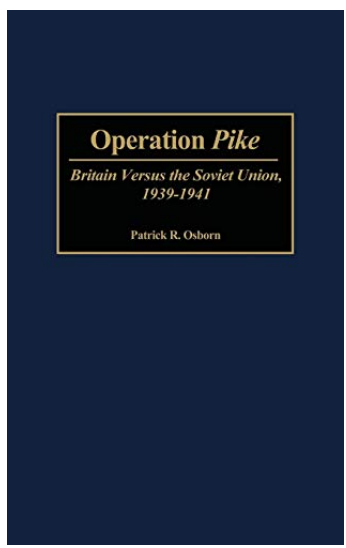
But although hindsight allows us to recognize the disastrous consequences of that ill-fated bombing plan, we should not be overly harsh upon the political leaders and strategists of the time. Military technology was in tremendous flux, and facts that seemed obvious by 1943 or 1944 were far less clear at the beginning of the conflict. Based upon their World War I experience, most analysts believed that neither the Germans nor the Allies had any hope of achieving an early breakthrough on the Western front, while the Soviets were suspected of being a feeble military power, perhaps therefore constituting the "soft underbelly" of the German war machine.

Also, some of the most far-reaching political consequences of an Allied attack upon the Soviet Union would have been totally unknown to the French and British leaders then considering it. Although they were certainly aware of the powerful Communist movements in their own countries, all closely aligned with the USSR, only many years later did

it become clear that the top leadership of the Roosevelt Administration was honeycombed by numerous agents fully loyal to Stalin, with the final proof awaiting the release of the Venona Decrypts in the 1990s. So if the Allied forces had suddenly gone to war against the Soviets, the total hostility of those influential individuals would have greatly reduced any future prospects of substantial American military assistance, let alone eventual intervention in the European conflict.

Thus, if the Germans had for any reason delayed their 1940 assault on France for a few weeks, the pending Allied attack would have brought the Soviets into the war on the other side, almost ensuring a German victory. It seems undeniable that Hitler's fortuitous action inadvertently saved the Allies from the disastrous consequences of their own foolish plans.

Although exploring the dramatic implications of the 1940 outbreak of an Allied-Soviet war may be an intriguing instance of alternative history, as an intellectual exercise it has little relevance to our present-day world. Far more important is what the account reveals about the reliability of the standard historical narrative that most of us have always accepted as real.



The first matter to explore was whether the evidence for the planned Allied attack on the Soviets was actually as strong as was suggested by the *National Interest* article. The underlying information came from *Operation Pike*, published in 2000 by Patrick R. Osborn in an academic

series entitled *Contributions in Military Studies*, so I recently ordered the book and read it to evaluate the remarkable claims being made.

Although rather dry, the 300 page monograph meticulously documents its case, with the overwhelming bulk of the material being drawn from official archives and other government records. There seems not the slightest doubt about the reality of the events being described, and the Allied leaders even made extensive diplomatic efforts to enlist Turkey and Iran in their planned attack against the Soviet Union.

While the primary Allied motive was to eliminate the flow of necessary raw materials to Germany, there were broader goals as well. Forced collectivization of Soviet agriculture during the 1930s had led to the widespread slaughter of farm animals, which were then replaced by tractors requiring gasoline. The Allied leadership believed that if they succeeded in eliminating the Soviet oil supply, the resulting fuel shortage would lead to a collapse in agricultural production, probably producing a famine that might help sweep the Communist regime from power. The Allies had always been intensely hostile to the Soviets, and the planned operation was actually named for a certain Col. Pike, a British officer who had died at Bolshevik hands in the Caucuses during a previous military intervention twenty years earlier.

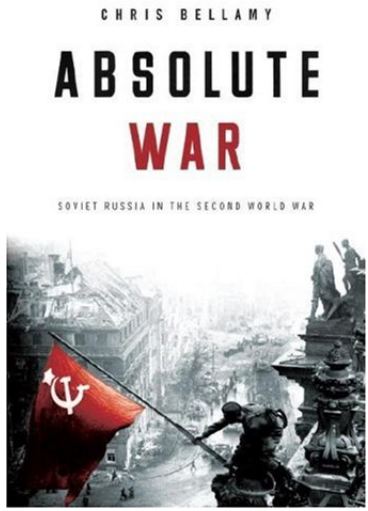
This anti-Soviet planning rapidly accelerated after Stalin's brutal attack upon tiny Finland in late 1939. The unexpectedly fierce Finnish resistance led the Western powers to expel the USSR from the League of Nations as a blatant aggressor, and also inspired widespread demands for military intervention among both the political elites and the general public, with serious proposals being considered to send several Allied divisions to Scandinavia to fight the Russians on behalf of the Finns. Indeed, during much of this period Allied hostility seems to have been far greater towards the Soviets than towards Germany, despite the nominal state of war against the latter, with French sentiments being particularly strong. As one British elected official remarked, "One has the impression that France is at war with Russia and merely on very unfriendly terms with Germany."

The Allies intended to use Polish exile forces in their ground combat against the Soviets, perhaps even sparking a Polish uprising against the hated Communist occupiers of their homeland. Osborn notes that if word of this plan had leaked to Stalin, that might explain why it was at this time that he signed the official orders directing the NKVD to immediately execute the 15,000 Polish officers and police whom he

already held as POWs, an incident eventually known as the Katyn Forest Massacre, which ranks as one of the world's worst wartime atrocities.

All of these military plans and internal discussions by the British and French were kept entirely secret at the time, and their archives remained sealed to historians for many decades. But in the opening of his fascinating account, Osborn explains that after the victorious German armies moved towards Paris in 1940, the French government attempted to destroy or evacuate all its secret diplomatic files, and a trainload of this very sensitive material was captured by German forces 100 miles from Paris, including the complete record of the plans to attack the USSR. In hopes of scoring an international propaganda coup, Germany soon published those crucial documents, providing both English translations and facsimile copies of the originals. Although it is unclear whether these disclosures received any significant Western media coverage at the time, Stalin surely became aware of this detailed confirmation of the information he had already gotten in bits and pieces from his network of well-placed Communist spies, and it must have deepened his distrust of the West. The story would also have quickly become known to all well-informed observers, explaining why Huddleston was so confident in casually mentioning the planned Allied attack in his 1952 memoirs.

After Hitler's *Barbarossa* invasion of the USSR in June 1941 suddenly brought the Soviets into the war on the Allied side, these highly-embarrassing facts would naturally have dropped into obscurity. But it seems quite astonishing that such "politically correct" amnesia became so deeply entrenched within the academic research community that virtually all traces of the remarkable story disappeared for the six decades that preceded the publication of Osborn's monograph. More English-language books may have been published on World War II during those years than on any other subject, yet it seems possible that those many tens of millions of pages contained not a single paragraph describing the momentous Allied plans to attack Russia in the early days of the war, perhaps even leaving Huddleston's brief, offhand remarks in 1952 as the most comprehensive account. Osborn himself notes the "precious little attention" given this matter by scholars of the Second World War, citing a 1973 academic journal article as one of the very few significant exceptions. We should be seriously concerned that events of such monumental importance spent more than two generations almost totally excluded from our historical records.



Moreover, even the release of Osborn's massively-documented academic study in 2000 seems to have been almost completely ignored by World War II historians. Consider, for example, *Absolute War* published in 2007 by acclaimed military historian Chris Bellamy, an 800 page work whose glowing cover-blurbs characterize it as the "authoritative" account of the role of Soviet Russia in the Second World War. The detailed 25 page index contains no listing for "Baku" and the only glancing reference to the indisputable Allied preparations to attack the USSR in early 1940 is a single obscure sentence appearing 15 months and 150 pages later in the aftermath of *Barbarossa*: "But on 23 June the NKGB reported that the Chief of the British Air Staff, Sir Charles Portal, had suggested cabling the commands in India and the Middle East ordering them to stop planning to bomb the Baku oilfields, which, it had been feared, might be used to supply the Germans." Osborn's revelations seem to have vanished without a trace until they were finally noticed and publicized 15 years later in *The National Interest*.

While it is quite easy to understand why historians avoided the subject for the first couple of decades following the end of the Second World War, once a generation or two had passed, one might reasonably expect to have seen some reassertion of scholarly objectivity. *Operation Pike* was of the greatest possible importance to the course of the war, so how could it have been almost totally ignored by virtually every writer on the subject? Allied preparations in early 1940 to unleash the largest strategic bombing offensive in world history against the Soviet Union hardly seems the sort of boring, obscure detail that would be easily forgotten.

Even if the first generation of war chroniclers carefully excluded it from their narratives to avoid ideological embarrassment, they must surely have been aware of the facts given German publication of the documents. And although their younger successors had seen no mention of it in the books they studied, one would expect that their mentors had occasionally whispered to them about some of the "hidden wartime secrets" left out of the standard narrative. Moreover, Osborn notes that discussion of the facts did very occasionally appear in professional academic journals, and one might assume that a single such instance would have spread like wildfire within the entire academic community. Yet even after Osborn's massively documented volume appeared in a respectable academic series, the silence remained absolutely deafening. The case of *Operation Pike* demonstrates that we must exercise extreme caution in accepting the accuracy and completeness of what we have been told.

Such conclusions have obvious consequences. My website tends to attract a large number of commenters, of widely varying quality. One of them, an immigrant from Soviet Armenia calling himself "Avery" seems quite knowledgeable and level-headed, though intensely hostile to Turks and Turkey. A couple of years ago, one of my articles on World War II provoked an intriguing comment from him:

> During the Battle of Stalingrad, Turkey, which was officially neutral but was secretly cooperating with Nazi Germany, had assembled a huge invasion force at the border of USSR (Armenia SSR). If Germans had won at Stalingrad, Turks were going to invade, race to Baku and link up with the German forces there, coming down from Stalingrad to grab the oilfields.
> When Paulus's army was surrounded and annihilated, Turks quickly left the border for their barracks.
>
> Stalin never forgot the Turk treachery and never forgave.
>
> When Germany surrendered, Stalin assembled huge armies in Armenia SSR and Georgia SSR. The plan was to invade and throw the Turks out of East Turkey/West Armenia.
>
> The detonation of two American atomic bombs convinced Stalin to stand down. Some believe US detonated the two bombs not to force Japan's surrender, but as a message to Stalin.

When questioned, he admitted he was unaware of any reference in a

Western source, but added:

> It was common knowledge in Armenia SSR, where I am originally from.
> WW2 war vets, old timers, discussed it all the time…..seeing more Red Army troops and military hardware assembling near the borders of Armenia SSR and Georgia SSR than they'd ever seen before. Then, they were all gone….

Under normal circumstances, weighing the universal silence of all Western historians against the informal claims of an anonymous commenter who was relying upon the stories he'd heard from old veterans would hardly be a difficult choice. But I wonder…

The official documents discussed by Osborn demonstrate that the British made considerable efforts to enlist Turkish forces in their planned attack upon the USSR, with the Turks going back and forth on the matter until Britain finally abandoned the project following the Fall of France. But if the Turks had strongly considered such a military adventure in 1940, it seems quite plausible that they would have been far more eager to do so 1942, given the huge losses the Soviets had already suffered at German hands, and with a very formidable German army approaching the Caucasus.

Soon after the war, Turkey became one of America's most crucial Cold War allies against the Soviets, being given a central role in the Truman Doctrine and the creation of NATO. Any hint that the same Turkish government had come very close to joining Hitler's Axis and attacking Russia as a Nazi ally just a few years earlier would have been extremely damaging to US interests. Such facts would have been scrupulously excluded from all our histories of the war.

Until a couple of weeks ago, I still probably would have leaned towards favoring the united front of all Western historians against the causal remarks of a single anonymous commenter on my website. But after reading Osborn's book, I now think the anonymous commenter is more likely correct. This is a rather sad personal verdict upon the current credibility of our historical profession.

These important considerations become particularly relevant when we attempt to understand the circumstances surrounding *Operation Barbarossa*, Germany's 1941 attack upon the Soviet Union, which constituted the central turning point of the war. Both at the time and

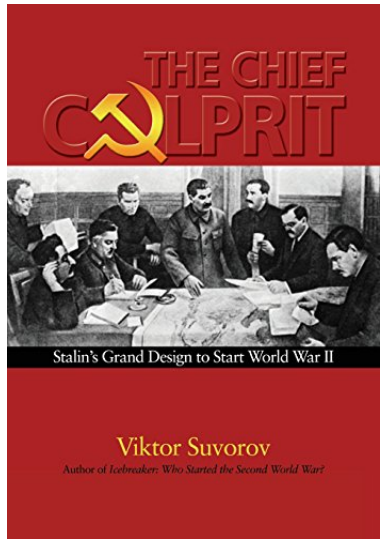
during the half-century which followed, Western historians uniformly claimed that the surprise assault had caught an overly-trusting Stalin completely unaware, with Hitler's motive being his dream of creating the huge German land-empire that he had hinted at in the pages of *Mein Kampf*, published sixteen years earlier.

But in 1990 a former Soviet military intelligence officer who had defected to the West and was living in Britain dropped a major bombshell. Writing under the pen-name Viktor Suvorov, he had already published a number of highly-regarded books on the armed forces of the USSR, but in *Icebreaker* he now claimed that his extensive past research in the Soviet archives had revealed that by 1941 Stalin had amassed enormous offensive military forces and positioned them all along the border, preparing to attack and easily overwhelm the greatly outnumbered and outgunned forces of the *Wehrmacht*, quickly conquering all of Europe.

As I summarized the Suvorov Hypothesis in an article last year:

> And so, just as in our traditional narrative, we see that in the weeks and months leading up to Barbarossa, the most powerful offensive military force in the history of the world was quietly assembled in secret along the German-Russian border, preparing for the order that would unleash their surprise attack. The enemy's unprepared airforce was to be destroyed on the ground in the first days of the battle, and enormous tank columns would begin deep penetration thrusts, surrounding and trapping the opposing forces, achieving a classic *blitzkrieg* victory, and ensuring the rapid occupation of vast territories. But the forces preparing this unprecedented war of conquest were Stalin's, and his military juggernaut would surely have seized all of Europe, probably soon followed by the remainder of the Eurasian landmass.
>
> Then at almost the last moment, Hitler suddenly realized the strategic trap into which he had fallen, and ordered his heavily outnumbered and outgunned troops into a desperate surprise attack of their own on the assembling Soviets, fortuitously catching them at the very point at which their own final preparations for sudden attack had left them most vulnerable, and thereby snatching a major initial victory from the jaws of certain defeat. Huge stockpiles of Soviet ammunition and weaponry had been positioned close to the border to supply the army of invasion into Germany, and these quickly fell into German hands, providing an important addition to their own woefully inadequate

resources.



THE CHIEF
CULPRIT
Stalin's Grand Design to Start World War II
Viktor Suvorov
Author of Icebreaker: Who Started the Second World War?

Although almost totally ignored in the English-language world, Suvorov's seminal book soon became an unprecedented bestseller in Russia, Germany, and many other parts of the world, and together with several follow-up volumes, his five million copies in print established him as the most widely-read military historian in the history of the world. Meanwhile, the English-language media and academic communities scrupulously maintained their complete blackout of the ongoing worldwide debate, with no publishing house even willing to produce an English edition of Suvorov's books until an editor at the prestigious Naval Academy Press finally broke the embargo nearly two decades later. Such near-total censorship of the massive planned Soviet attack in 1941 seems quite similar to the near-total censorship of the undeniable reality of the massive planned Allied attack on the Soviets in the preceding year.

Although the Suvorov Hypothesis has inspired decades of fierce academic debate and been the subject of international conferences, it has been scrupulously ignored by our Anglophone authors, who have made no serious attempt to defend their traditional narrative and refute the vast accumulation of persuasive evidence upon which it is based. This leads me to believe that Suvorov's analysis is probably correct.

A decade ago, a solitary writer first drew my attention to Suvorov's ground-breaking research, and as an emigrant Russian Slav living in the West, he was hardly favorable to the German dictator. But he closed his review with a remarkable statement:

> Therefore, if any of us is free to write, publish, and read this today, it follows that in some not inconsequential part our gratitude for this must go to Hitler. And if someone wants to arrest me for saying what I have just said, I make no secret of where I live.

- American Pravda: When Stalin Almost Conquered Europe
  Ron Unz • June 4, 2018 • 4,200 Words

For almost thirty years, our English-language media has almost entirely suppressed any serious discussion of the Suvorov Hypothesis, and this is hardly the only important aspect of Soviet history that has remained hidden from public scrutiny. Indeed, on some crucial matters, the falsehoods and distortions have greatly increased rather than diminished over the decades. No example is more obvious than in the ongoing attempts to conceal the enormous role played by Jews in the Bolshevik Revolution and worldwide Communism generally. As I wrote last year:

> In the early years of the Bolshevik Revolution, almost no one questioned the overwhelming role of Jews in that event, nor their similar preponderance in the ultimately unsuccessful Bolshevik takeovers in Hungary and parts of Germany. For example, former British Minister Winston Churchill in 1920 denounced the "terrorist Jews" who had seized control of Russia and other parts of Europe, noting that "the majority of the leading figures are Jews" and stating that "In the Soviet institutions the predominance of Jews is even more astonishing," while lamenting the horrors these Jews had inflicted upon the suffering Germans and Hungarians.
>
> Similarly, journalist Robert Wilton, former Russia correspondent of the *Times of London*, provided a very detailed summary of the enormous Jewish role in his 1918 book *Russia's Agony* and 1920 book *The Last Days of the Romanovs*, although one of the most explicit chapters of the latter was apparently excluded from the English language edition. Not long afterward, the facts regarding the enormous financial support provided to the Bolsheviks by international Jewish bankers such as Schiff and Aschberg were widely reported in the mainstream media.
>
> Jews and Communism were just as strongly tied together in America, and for years the largest circulation Communist

> newspaper in our country was published in Yiddish. When they were finally released, the Venona Decrypts demonstrated that even as late as the 1930s and 1940s, a remarkable fraction of America's Communist spies came from that ethnic background.
>
> A personal anecdote tends to confirm these dry historical records. During the early 2000s I once had lunch with an elderly and very eminent computer scientist, with whom I'd become a little friendly. While talking about this and that, he happened to mention that both his parents had been zealous Communists, and given his obvious Irish name, I expressed my surprise, saying that I'd thought almost all the Communists of that era were Jewish. He said that was indeed the case, but although his mother had such an ethnic background, his father did not, which made him a very rare exception in their political circles. As a consequence, the Party had always sought to place him in as prominent a public role as possible just to prove that not all Communists were Jews, and although he obeyed Party discipline, he was always irritated at being used as such a "token."
>
> However, once Communism sharply fell out of favor in 1950s America, nearly all of the leading "Red Baiters" such as Sen. Joseph McCarthy went to enormous lengths to obscure the ethnic dimension of the movement they were combatting. Indeed, many years later Richard Nixon casually spoke in private of the difficulty he and other anti-Communist investigators had faced in trying to focus on Gentile targets since nearly all of the suspected Soviet spies were Jewish, and when this tape became public, his alleged anti-Semitism provoked a media firestorm even though his remarks were obviously implying the exact opposite.
>
> This last point is an important one, since once the historical record has been sufficiently whitewashed or rewritten, any lingering strands of the original reality that survive are often perceived as bizarre delusions or denounced as "conspiracy theories." Indeed, even today the ever-amusing pages of Wikipedia provides an entire 3,500 word article attacking the notion of "Jewish Bolshevism" as an "antisemitic canard."

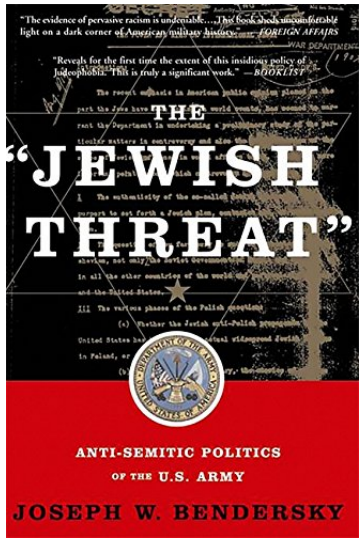
In a subsequent article, I summarized several of the numerous sources describing this obvious reality:

> Meanwhile, all historians know perfectly well that the Bolshevik leaders were overwhelmingly Jewish, with three of the five revolutionaries Lenin named as his plausible successors coming

from that background. Although only around 4% of Russia's population was Jewish, a few years ago Vladimir Putin stated that Jews constituted perhaps 80-85% of the early Soviet government, an estimate fully consistent with the contemporaneous claims of Winston Churchill, *Times of London* correspondent Robert Wilton, and the officers of American Military Intelligence. Recent books by Alexander Solzhenitsyn, Yuri Slezkine, and others have all painted a very similar picture. And prior to World War II, Jews remained enormously over-represented in the Communist leadership, especially dominating the Gulag administration and the top ranks of the dreaded NKVD.

Perhaps the most utterly explosive and totally suppressed aspect of the close relationship between Jews and Communism regards the claims that Jacob Schiff and other top international Jewish bankers were among the leading financial backers of the Bolshevik Revolution. I spent nearly all of my life regarding these vague rumors as such obvious absurdities that they merely demonstrated the lunatic anti-Semitism infesting the nether-regions of Far Right anti-Communist movements, thereby fully confirming the theme of Richard Hofstadter's famous book *The Paranoid Style in American Politics*. Indeed, the Schiff accusations were so totally ridiculous that they were never even once mentioned in the hundred-odd books on the history of the Bolshevik Revolution and Soviet Communism that I read during the 1970s and 1980s.

Therefore, it came as an enormous shock when I discovered that the claims were not only probably correct, but had been almost universally accepted as true throughout the first half of the twentieth century.



"The evidence of pervasive racism is undeniable. . . . This book sheds much comfortable light on a dark corner of American military history." — FOREIGN AFFAIRS
"Reveals for the first time the extent of this insidious policy of [illegible]. This is truly a significant work." — BOOKLIST
THE
"JEWISH
THREAT"
ANTI-SEMITIC POLITICS
OF THE U.S. ARMY
JOSEPH W. BENDERSKY

For example, *The "Jewish Threat"* by Joseph W. Bendersky summarizes his years of archival research and he documents that Schiff's financial support for the Bolsheviks was widely reported in the American Military Intelligence files of the period, with British Intelligence taking the same position. Kenneth D. Ackerman's 2016 study *Trotsky in New York, 1917* describes much the same material. In 1925, the British Guardian published this information and it was soon widely discussed and accepted throughout the 1920s and 1930s by numerous major international media outlets. Naomi W. Cohen's 1991 hagiographic volume *Jacob Schiff* devotes several pages to summarizing the various stories of Schiff's strong Bolshevik ties that had earlier been published in leading American periodicals.

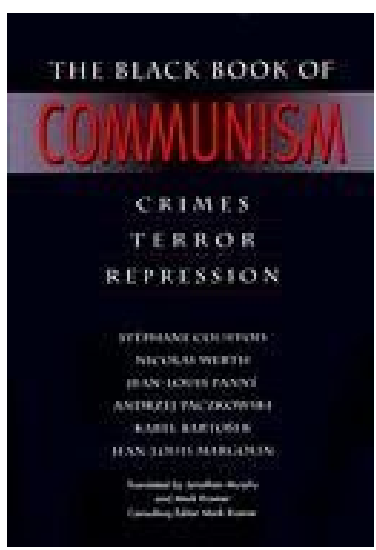
Writing nearly a century after the events under discussion, these three Jewish authors casually dismiss all the numerous accounts they provide by highly-credible observers—American and British Intelligence officers and prominent international journalists—as merely demonstrating the delusional nature of the extreme anti-Semitism that had infected so much of the world in those bygone days. Yet most serious historians would surely place far greater weight upon contemporaneous evidence than upon the personal opinions of those writers who happen to gather together that material evidence generations afterward.

Henry Wickham Steed was one of the foremost journalists of his era, and he had served as editor of the *Times of London*, the world's most authoritative newspaper. A couple of years after his retirement, he published his lengthy personal memoirs, now conveniently online, which contain the following very intriguing passages:

> Potent international financial interests were at work in favour of the immediate recognition of the Bolshevists. Those influences had been largely responsible for the Anglo-American proposal in January to call Bolshevist representatives to Paris at the beginning of the Peace Conference — a proposal which had failed after having been transformed into a suggestion for a Conference with the Bolshevists at Prinkipo. The well-known American Jewish banker, Mr. Jacob Schiff, was known to be anxious to secure recognition for the Bolshevists…
>
> …the prime movers were Jacob Schiff, Warburg, and other international financiers, who wished above all to bolster up the Jewish Bolshevists in order to secure a field for German and Jewish exploitation of Russia.

Schiff's own family later confirmed this widely-accepted history. The February 3, 1949 *Knickerbocker* column of the *New York Journal-American*, then one of the city's leading newspapers, reported the account: "Today it is estimated by Jacob's grandson, John Schiff, that the old man sank about 20,000,000 dollars for the final triumph of Bolshevism in Russia." The present-day value of the figure quoted is probably around $2 billion, a very substantial sum.

Despite this enormous volume of persuasive evidence, for the next half-century or more Schiff's name almost entirely vanished from all mainstream texts on Soviet Communism. As I wrote last year:



> In 1999, Harvard University published the English edition of *The Black Book of Communism*, whose six co-authors devoted 850

pages to documenting the horrors inflicted upon the world by that defunct system, which had produced a total death toll they reckoned at 100 million. I have never read that book and I have often heard that the alleged body-count has been widely disputed. But for me the most remarkable detail is that when I examine the 35 page index, I see a vast profusion of entries for totally obscure individuals whose names are surely unknown to all but the most erudite specialist. But there is no entry for Jacob Schiff, the world-famous Jewish banker who apparently financed the creation of the whole system in the first place. Nor one for Olaf Aschberg, the powerful Jewish banker in Sweden, who played such an important role in providing the Bolsheviks a financial life-line during the early years of their threatened regime, and even founded the first Soviet international bank.

- American Pravda: The Bolshevik Revolution and Its Aftermath
  Ron Unz • July 23, 2018 • 6,900 Words

Perhaps the extreme caution and timorous silence exhibited by nearly all Western historians on these sensitive elements of World War II and the Bolshevik Revolution should not entirely surprise us given the professional and personal risks they might face if they strayed from orthodoxy.

Consider the very telling example of David Irving. During the first half of his professional career, his string of widely-translated best-sellers and his millions of books in print probably established him as the most internationally successful British historian of the last one hundred years, with his remarkable archival research frequently revolutionizing our understanding of the European conflict and the political forces behind it. But as he repeatedly demonstrated his lack of regard for official orthodoxy, he attracted many powerful enemies, who eventually ruined his reputation, drove him into personal bankruptcy, and even arranged his imprisonment. Over the last quarter-century, he has increasingly become an un-person, with the few occasional mentions of his name in the media invoked in the same talismanic manner as references to Lucifer or Beelzebub.

If a historian of such towering stature and success could be brought so low, what ordinary academic scholar would dare risk a similar fate? Voltaire famously observed that shooting an admiral every now and then is an excellent way to encourage the others.

- The Remarkable Historiography of David Irving
  Ron Unz • June 4, 2018 • 1,700 Words

The destruction of Irving's stellar career came at the hands of Jewish activists, who were outraged at his balanced treatment of Hitler and his ongoing commitment to investigating many of the widely-accepted wartime myths, which he hoped to replace with what he called "real history." In the introduction to his new edition of *Hitler's War*, he recounts how a journalist for *Time* magazine was having dinner with him in New York in 1988 and remarked "Before coming over I read the clippings files on you. Until *Hitler's War* you couldn't put a foot wrong, you were the darling of the media; after it, they heaped slime on you."

As Irving was certainly aware, the unreasonably harsh vilification of enemy leaders during wartime is hardly an uncommon occurrence. Although it has largely been forgotten today, during much of the First World War and for years afterward, Germany's reigning monarch, Kaiser Wilhelm, was widely portrayed in the Allied countries as a bloodthirsty monster, one of the most evil men who had ever lived. This vilification came despite Wilhelm having been the beloved eldest grandchild of Britain's own Queen Victoria, who according to some accounts died in his arms.

Moreover, although Allied propaganda routinely portrayed Wilhelm as a relentless warmonger, he had actually avoided involving Germany in a single major military conflict during the first twenty-five years of his reign, while most of the other leading world powers had fought one or more major wars during that same period. Indeed, I recently discovered that only a year before the Guns of August began firing, *The New York Times* had published a lengthy profile marking the first quarter-century of Wilhelm's reign, lauding him as one of the world's foremost peacemakers:

> Now … he is acclaimed everywhere as the greatest factor for peace that our time can show. It was he, we hear, who again and again threw the weight of his dominating personality, backed by the greatest military organisation in the world – an organisation built up by himself – into the balance for peace wherever war clouds gathered over Europe. ((William II, King of Prussia and German Emperor, Kaiser 25 years a ruler, hailed as chief peacemaker,' *New York Times*, 8 June, 1913)

That brief excerpt from the *Times* encomium points to another matter than I have never seen mentioned. I devoted much of the 2000s to

digitizing and making available the complete archives of hundreds of America's leading publications of the last 150 years, and when I occasionally glanced at the contents, I gradually noticed something odd. Although the English-language world today invariably refers to Germany's wartime ruler as "Kaiser Wilhelm," that was only very rarely the case prior to the outbreak of war, when he was generally known as "Emperor William." The latter nomenclature is hardly surprising since we always speak of "Frederick the Great" rather than "Friedrich der Grosse."

But it is obviously much easier to mobilize millions of citizens to die in muddy trenches in order to defeat a monstrously alien "Kaiser" than "Good Emperor William," first cousin to the British and Russian monarchs. The NGram viewer in Google Books shows the timing of the change quite clearly, with the Anglophone practice shifting as Britain became increasingly hostile toward Germany, especially after the outbreak of war. But "Emperor William" was only permanently eclipsed by "Kaiser Wilhelm" after Germany once again became a likely enemy in the years immediately preceding World War II.

Actual publications of the period also reveal numerous discordant facts about the First World War, matters certainly known to academic specialists but which have rarely received much coverage in our standard textbooks, instead being relegated to a casual sentence or two if even that. For example, despite its considerable military successes, Germany launched a major peace effort in late 1916 to end the stalemated war by negotiations and thereby avert oceans of additional bloodshed. However, this proposal was fiercely rejected by the Allied powers and their advocates in the pages of the world's leading periodicals since they remained firmly committed to an ultimate military victory.

War fever was certainly still very strong that same year in Britain, the leading Allied power. When prominent peace-advocates such as Bertrand Russell and Lord Loreborn urged a negotiated end to the fighting, and were strongly backed by the editor of the influential London *Economist*, they were harshly vilified and the latter was forced to resign his position. E.D. Morel, another committed peace advocate, was imprisoned for his activism under such harsh conditions that it permanently broke his health and led to his early death at age 51 a few years after his release.

As an excellent antidote to our severely distorted understanding of both wartime sentiments and the domestic European politics that had produced the conflict, I would strongly recommend the text of *Present*

*Day Europe* by Lothrop Stoddard, then one of America's most influential public intellectuals. Written prior to America's own entry into the conflict, the work provides the sort of remarkable scholarly detachment which would soon became almost impossible in American historiography.

- Present-Day Europe
  *Its National States of Mind*
  Lothrop Stoddard • 1917 • 74,000 Words

Although the demonic portrayal of the German Kaiser was already being replaced by a more balanced treatment within a few years of the Armistice and had disappeared after a generation, no such similar process has occurred in the case of his World War II successor. Indeed, Adolf Hitler and the Nazis seem to loom far larger in our cultural and ideological landscape today than they did in the immediate aftermath of the war, with their visibility growing even as they become more distant in time, a strange violation of the normal laws of perspective. I suspect that the casual dinner-table conversations on World War II issues that I used to enjoy with my Harvard College classmates during the early 1980s would be completely impossible today.

To some extent, the transformation of "the Good War" into a secular religion, with its designated monsters and martyrs may be analogous to what occurred during the final decay of the Soviet Union, when the obvious failure of its economic system forced the government to increasingly turn to endless celebrations of its victory in the Great Patriotic War as the primary source of its legitimacy. The real wages of ordinary American workers have been stagnant for fifty years and most adults have less than $500 in available savings, so this widespread impoverishment may be forcing our own leaders into adopting a similar strategy.

But I think that a far greater factor has been the astonishing growth of Jewish power in America, which was already quite substantial even four or five decades ago but has now become absolutely overwhelming, whether in foreign policy, finance, or the media, with our 2% minority exercising unprecedented control over most aspects of our society and political system. Only a fraction of American Jews hold traditional religious beliefs, so the twin worship of the State of Israel and the Holocaust has served to fill that void, with the individuals and events of World War II constituting many of the

central elements of the *mythos* that serves to unify the Jewish community. And as an obvious consequence, no historical figure ranks higher in the demonology of this secular religion than the storied Fuhrer and his Nazi regime.

However, beliefs based upon religious dogma often sharply diverge from empirical reality. Pagan Druids may worship a particular sacred oak tree and claim that it contains the soul of their tutelary dryad; but if an arborist taps the tree, its sap may seem like that of any other.

Our current official doctrine portrays Adolf Hitler's Nazi Germany as one of the cruelest and most relentlessly aggressive regimes in the history of the world, but at the time these salient facts apparently escaped the leaders of the nations with which it was at war. *Operation Pike* provides an enormous wealth of archival material regarding the secret internal discussions of the British and French governmental and military leadership, and all of it tends to suggest that they regarded their German adversary as a perfectly normal country, and perhaps occasionally regretted that they had somehow gotten themselves involved a major war over what amounted to a small Polish border dispute.

During late 1939, a major American news syndicate had sent Stoddard to spend a few months in wartime Germany and provide his perspective, with his numerous dispatches appearing in *The New York Times* and other leading newspapers. Upon his return, he published a 1940 book summarizing all his information, seemingly just as even-handed as his earlier 1917 volume. His coverage probably constitutes one of the most objective and comprehensive American accounts of the mundane domestic nature of National Socialist Germany, and thus may seem rather shocking to modern readers steeped in eighty years of increasingly unrealistic Hollywood propaganda.

- Into the Darkness
  *An Uncensored Report from Inside the Third Reich At War*
  Lothrop Stoddard • 1940 • 79,000 Words

And although our standard histories would never admit this, the actual path toward war appears to have been quite different than most Americans believe. Extensive documentary evidence from knowledgeable Polish, American, and British officials demonstrates that pressure from Washington was the key factor behind the outbreak of the European conflict. Indeed, leading American journalists and public intellectuals of the day such as John T. Flynn and Harry Elmer Barnes had publicly declared that they feared Franklin Roosevelt was

seeking to foment a major European war in hopes that it would rescue him from the apparent economic failure of his New Deal reforms and perhaps even provide him an excuse to run for an unprecedented third term. Since this is exactly what ultimately transpired, such accusations would hardly seem totally unreasonable.

And in an ironic contrast with FDR's domestic failures, Hitler's own economic successes had been enormous, a striking comparison since the two leaders had come to power within a few weeks of each other in early 1933. As iconoclastic leftist Alexander Cockburn once noted in a 2004 *Counterpunch* column:

> When [Hitler] came to power in 1933 unemployment stood at 40 per cent. Economic recovery came without the stimulus of arms spending…There were vast public works such as the autobahns. He paid little attention to the deficit or to the protests of the bankers about his policies. Interest rates were kept low and though wages were pegged, family income increased by reason of full employment. By 1936 unemployment had sunk to one per cent. German military spending remained low until 1939.
>
> Not just Bush but Howard Dean and the Democrats could learn a few lessons in economic policy from that early, Keynesian Hitler.

[image]

By resurrecting a prosperous Germany while nearly all other countries remained mired in the worldwide Great Depression, Hitler drew glowing accolades from individuals all across the ideological spectrum. After an extended 1936 visit, David Lloyd George, Britain's former wartime prime minister, fulsomely praised the chancellor as "the George Washington of Germany," a national hero of the greatest stature. Over the years, I've seen plausible claims here and there that during the 1930s Hitler was widely acknowledged as the world's most popular and successful national leader, and the fact that he was selected as *Time Magazine*'s Man of the Year for 1938 tends to support this belief.

Only International Jewry had remained intensely hostile to Hitler, outraged over his successful efforts to dislodge Germany's 1% Jewish population from the stranglehold they had gained over German media and finance, and instead run the country in the best interests of the 99% German majority. A striking recent parallel has been the enormous hostility that Vladimir Putin incurred after he ousted the handful of Jewish Oligarchs who had seized control of Russian society

and impoverished the bulk of the population. Putin has attempted to mitigate this difficulty by allying himself with certain Jewish elements, and Hitler seems to have done the same by endorsing the Nazi-Zionist economic partnership, which lay the basis for the creation of the State of Israel and thereby brought on board the small, but growing Jewish Zionist faction.

In the wake of the 9/11 Attacks, the Jewish Neocons stampeded America towards the disastrous Iraq War and the resulting destruction of the Middle East, with the talking heads on our television sets endlessly claiming that "Saddam Hussein is another Hitler." Since then, we have regularly heard the same tag-line repeated in various modified versions, being told that "Muammar Gaddafi is another Hitler" or "Mahmoud Ahmadinejad is another Hitler" or "Vladimir Putin is another Hitler" or even "Hugo Chavez is another Hitler." For the last couple of years, our American media has been relentlessly filled with the claim that "Donald Trump is another Hitler."

During the early 2000s, I obviously recognized that Iraq's ruler was a harsh tyrant, but snickered at the absurd media propaganda, knowing perfectly well that Saddam Hussein was no Adolf Hitler. But with the steady growth of the Internet and the availability of the millions of pages of periodicals provided by my digitization project, I've been quite surprised to gradually also discover that Adolf Hitler was no Adolf Hitler.

It might not be entirely correct to claim that the story of World War II was that Franklin Roosevelt sought to escape his domestic difficulties by orchestrating a major European war against the prosperous, peace-loving Nazi Germany of Adolf Hitler. But I do think that picture is probably somewhat closer to the actual historical reality than the inverted image more commonly found in our textbooks.

# Secrets of Military Intelligence

June 10, 2019 • 12,500 Words

Some may remember that in 2005 a major media controversy engulfed Harvard President Larry Summers over his remarks at an academic conference. Casually speaking off-the-record at the private gathering, Summers had gingerly raised the hypothetical possibility that on average men might be a bit better at mathematics than women, perhaps partially explaining the far larger number of males holding faculty positions in the math, science, and engineering departments.

These controversial speculations were soon leaked to the press, and an enormous firestorm of protest erupted, with MIT professor Nancy Hopkins claiming that merely hearing Summers' words at the event had left her physically ill, forcing her to quickly exit the room lest she suffer a blackout and collapse.

Harvard students and faculty members soon launched an organized campaign to have Summers removed from the summit of our academic world, with noted evolutionary-psychologist Steven Pinker being one of the very few professors willing to publicly defend him. Eventually, an unprecedented "no confidence" vote by the entire faculty and growing loss of confidence by the Board of Trustees forced Summers to resign, becoming the first Harvard President to suffer that fate in the university's 350 year history, thus apparently demonstrating the astonishing power of feminist "political correctness" on college campuses.

The true story for those who followed it was actually quite a bit more complex. Summers, a former Clinton Administration Treasury Secretary, had a long record of very doubtful behavior, which had outraged many faculty members for entirely different reasons. As I wrote a few years ago:

> Now I am hardly someone willing to defend Summers from a whole host of very serious and legitimate charges. He seems to have played a major role in transmuting Harvard from a renowned university to an aggressive hedge fund, policies that subsequently brought my beloved alma mater to the very brink of bankruptcy during the 2008 financial crisis. Under his presidency, Harvard paid out $26 million dollars to help settle international insider-trading charges against Andrei Shleifer, one

> of his closest personal friends, who avoided prison as a consequence. And after such stellar financial and ethical achievements, he was naturally appointed as one of President Obama's top economic advisors, a position from which he strongly supported the massive bailout of Wall Street and the rest of our elite financial services sector, while ignoring Main Street suffering. Perhaps coincidentally, wealthy hedge funds had paid him many millions of dollars for providing a few hours a week of part-time consulting advice during the twelve months prior to his appointment.

Moreover, Summers had previously denounced anti-Israel activism by Harvard students and faculty members as "anti-Semitic," an accusation that provoked fierce opposition. A few years later, it also came out that Summers may have played a crucial role in favoring Mark Zuckerberg over the Winkelvoss brothers in their early battle for ownership of Facebook, while Summers' former assistant Sheryl Sandberg later became Facebook president, making her a multi-billionaire.

Although Summers' impolitic remarks regarding female math ability had certainly sparked his ouster, the underlying cause was probably his many years of extremely unbecoming behavior. Indeed, I think a reasonable case can be made that Summers was the worst and most disreputable president in all of Harvard's long history.

Still, even a broken or crooked clock is right twice a day, and I doubt that Larry Summers is the only person in the world who suspects that men might be a bit better at math than women. But some strongly disagree with this assessment, and in the wake of the Summers controversy one of his fiercest academic critics was a certain Janet Mertz, who specialized in cancer research at the University of Wisconsin.

In order to effectively refute Summers' odious speculations, she and her co-authors decided to carefully examine the total roster of participants in the International Math Olympiads for the years 1988-2007. These 3200-odd individuals represent the world's highest-performing math students drawn from the secondary schools of dozens of countries, and the gender distribution across so many different cultures and years would surely constitute powerful quantitative evidence of whether males and females significantly differed in their average aptitudes. Since most of these thousands of international Math Olympians are drawn from countries having non-Western first names, determining the genders of each and every one is hardly a

trivial undertaking, and we should greatly commend the diligent research that Mertz and her colleagues undertook to accomplish this task.

They published their important results in a 10,000 word academic journal article, whose "first and foremost" conclusion, provided in bold-italics, was that ***"the myth that females cannot excel in mathematics must be put to rest."*** And in her subsequent press interviews, she proclaimed that her research had demonstrated that men and women had equal innate ability in mathematics, and that any current differences in performance were due to culture or bias, a result which our media gleefully promoted far and wide.

But strangely enough, when I actually bothered to read the text and tables of her eye-glazingly long and dull academic study, I noticed something quite intriguing, especially in the quantitative results conveniently summarized in Tables 6 and 7 (pp. 1252-53), and mentioned it in a column of my own:

> The first of these shows the gender-distribution of the 3200-odd Math Olympians of the leading 34 countries for the years 1988-2007, and a few minutes with a spreadsheet reveals that the skew is 95% male and 5% female. Furthermore, almost every single country, whether in Europe, Asia, or elsewhere, seems to follow this same pattern, with the female share ranging between 0% and 12% but mostly close to 5%; Serbia/Montenegro is the only major outlier at 20% female. Similarly, Table 7 provides a gender distribution of results for just the United States, and we find that just 5 of our 126 Math Olympians—or 4%—have been female. Various other prestigious math competitions seem to follow a roughly similar gender skew.

These remarkable findings are even more easily grasped when we summarize the male percentages of top math students aggregated across 1988-2008 for each individual country:

**ASIA:**
China, 96% male
India, 97% male
Iran, 98% male
Israel, 98% male
Japan, 98% male
Kazakhstan, 99% male
South Korea, 93% male
Taiwan, 95% male

Turkey, 96% male
Vietnam, 97% male

**EUROPE:**
Belarus, 94% male
Bulgaria, 91% male
Czech Republic, 96% male
Slovakia, 88% male
France 97% male
Germany, 94% male
Hungary, 94% male
Poland, 99% male
Romania, 94% male
Russia/USSR, 88% male
Serbia and Montenegro, 80% male
Ukraine, 93% male
United Kingdom, 93% male

**OTHER:**
Australia, 94% male
Brazil, 96% male
Canada, 90% male
**USA, 96% male**

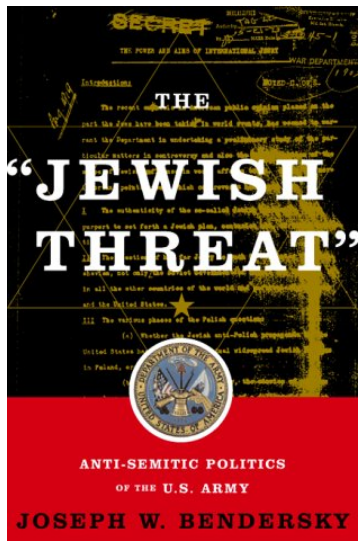
**INTERNATIONAL AVERAGE**, 94.4% male

These are the empirical results that Mertz and her co-authors touted as conclusively demonstrating that males and females have equal mathematical ability. As near as I can tell, no previous journalist or researcher had noticed the considerable divergence between Mertz's empirical data and her stated conclusions, or perhaps any such individuals were just too intimidated to focus public attention on that discrepancy.

This striking disconnect between a study's purported findings and its actual results should alert us to similar possibilities elsewhere. Perhaps it is not so totally rare that diligent researchers whose ideological zeal sufficiently exceeds their mental ability may spend enormous time and effort gathering information but then interpreting it in a manner exactly contrary to its obvious meaning.

These thoughts recently came to my mind when I decided to read a remarkable analysis of the American military by Joseph W. Bendersky

of Virginia Commonwealth University, a Jewish historian specializing in Holocaust Studies and the history of Nazi Germany. Last year, I had glanced at a few pages of his text for my long article on Holocaust Denial, but I now decided to carefully read the entire work, published in 2000.



Bendersky devoted ten full years of research to his book, exhaustively mining the archives of American Military Intelligence as well as the personal papers and correspondence of more than 100 senior military figures and intelligence officers. *The "Jewish Threat"* runs over 500 pages, including some 1350 footnotes, with the listed archival sources alone occupying seven full pages. His subtitle is "Anti-Semitic Politics of the U.S. Army" and he makes an extremely compelling case that during the first half of the twentieth century and even afterward, the top ranks of the U.S. military and especially Military Intelligence heavily subscribed to notions that today would be universally dismissed as "anti-Semitic conspiracy theories."

Put simply, U.S. military leaders in those decades widely believed that the world faced a direct threat from organized Jewry, which had seized control of Russia and similarly sought to subvert and gain mastery over America and the rest of Western civilization.

In these military circles, there was an overwhelming belief that powerful Jewish elements had financed and led Russia's Bolshevik Revolution, and were organizing similar Communist movements elsewhere aimed at destroying all existing Gentile elites and imposing Jewish supremacy throughout America and the rest of the Western

world. While some of these Communist leaders were "idealists," many of the Jewish participants were cynical opportunists, seeking to use their gullible followers to destroy their ethnic rivals and thereby gain wealth and supreme power. Although Intelligence officers gradually came to doubt that the *Protocols of the Elders of Zion* was an authentic document, most believed that the notorious work provided a reasonably accurate description of the strategic plans of the Jewish leadership for subverting America and the rest of the world and establishing Jewish rule.

Although Bendersky's claims are certainly extraordinary ones, he provides an enormous wealth of compelling evidence to support them, quoting or summarizing thousands of declassified Intelligence files, and further supporting his case by drawing from the personal correspondence of many of the officers involved. He conclusively demonstrates that during the very same years that Henry Ford was publishing his controversial series *The International Jew*, similar ideas, but with a much sharper edge, were ubiquitous within our own Intelligence community. Indeed, whereas Ford mostly focused upon Jewish dishonesty, malfeasance, and corruption, our Military Intelligence professionals viewed organized Jewry as a deadly threat to American society and Western civilization in general. Hence the title of Bendersky's book.

- The International Jew
  *The World's Foremost Problem*
  Henry Ford • 1920 • 323,000 Words

These widespread beliefs had important political consequences. In recent decades, our leading immigration restrictionists have regularly argued that anti-Semitism played absolutely no role in the 1924 Immigration Act drastically curtailing European immigration; and the debates and speeches found in the Congressional Record have tended to support their claims. However, last year, I speculated that the widespread awareness of the Jewish leadership of the Bolshevik Revolution may have been a large factor behind the legislation, but one that was kept away from the public record. Bendersky's research fully confirms my suspicions, and he reveals that one of the former military officers most fearful of Jewish immigrant subversion actually played a crucial role in orchestrating passage of the legislation, whose central unstated goal was eliminating any further influx of Eastern European Jews.

The bulk of the fascinating material that Bendersky cites comes from Intelligence reports and official letters contained in permanent military archives. Therefore, we must keep in mind that the officers producing such documents would surely have chosen their words carefully and avoided putting all their controversial thoughts down on paper, raising the possibility that their actual beliefs may have been far more extreme. A particular late 1930s case involving one top general provides insight into the likely opinions and private conversations of some of those individuals.

Although his name would mean nothing today, Deputy Chief of Staff George Van Horn Moseley spent most of the 1930s as one of America's most highly-regarded generals, having been considered for the top command of our armed forces and also serving as a personal mentor to Dwight D. Eisenhower, future Secretary of State George C. Marshall, and numerous other leading military figures. He seems to have been well-liked within our military establishment, and had an excellent personal reputation.

Moseley also had very strong opinions on the major public issues of the day, and after his retirement in 1938 freed him from military discipline, he began to aggressively promote these views, going on a nationwide speaking tour. He repeatedly denounced Roosevelt's military buildup and in an early 1939 speech, he declared that "The war now being proposed is for the purpose of establishing Jewish hegemony throughout the world." He stated that only Jews would profit from the war, claimed that leading Wall Street Jews had financed the Russian Revolution, and warned Americans not to let history repeat itself. Although Moseley's outspokenness soon earned him a reprimand from the Roosevelt Administration, he also received private letters of support from other top generals and former president Herbert Hoover.

In his Congressional testimony just before the outbreak of World War II, Moseley became even more outspoken. He declared that the "murder squads" of Jewish Communists had killed "millions of Christians," but that "fortunately, the character of the German people was aroused" against these traitors within their midst and that therefore "We should not blame the Germans for settling the problem of the Jew within their borders for all time." He even urged our national leaders to "benefit" from the German example in addressing America's own festering domestic Jewish problem.

As might be expected, Moseley's 1939 praise of Germany's Jewish policy in front of Congress provoked a powerful media backlash, with

a lead story in *The New Republic* denouncing him as a Nazi "fifth columnist" and *The Nation* attacking him in similar fashion; and after war broke out, most public figures gradually distanced themselves. But both Eisenhower and Marshall continued to privately regard him with great admiration and remained in friendly correspondence for many years, strongly suggesting that his harsh appraisal of Jews had hardly been a deep secret within his personal circle.

Bendersky claims that Moseley's fifty boxes of memoirs, private papers, and correspondence "embody every kind of anti-Semitic argument ever manifested in the history of Western civilization," and based on the various extreme examples he provides, few would dispute that verdict. But he also notes that Moseley's statements differed little from the depictions of Jews expressed by General George S. Patton immediately after World War II, and even maintained by some retired generals well into the 1970s.

Although I would not question the accuracy of Bendersky's exhaustive archival research, he seems considerably less sure-footed regarding American intellectual history and sometimes allows his personal sentiments to lead him into serious error. For example, his first chapter devotes a couple of pages to E.A. Ross, citing some of his unflattering descriptions of Jews and Jewish behavior, and suggesting he was a fanatic anti-Semite, who dreaded "the coming catastrophe of an America overrun by racially inferior people."

But Ross was actually one of our greatest early sociologists, and his 26 page discussion of Jewish immigrants published in 1913 was scrupulously fair-minded and even-handed, describing both positive and negative characteristics, following similar chapters on Irish, German, Scandinavian, Italian, and Slavic newcomers. And although Bendersky routinely denounces his own ideological villains as "Social Darwinists," the source he actually cites regarding Ross correctly identified the scholar as one of America's leading *critics* of Social Darwinism. Indeed, Ross's stature in left-wing circles was so great that he was selected as a member of the Dewey Commission, organized to independently adjudicate the angry conflicting accusations of Stalinists and Trotskyites. And in 1936, a Jewish leftist fulsomely praised Ross's long and distinguished scholarly career in the pages of *The New Masses*, the weekly periodical of the American Communist Party, only regretting that Ross had never been willing to embrace Marxism.

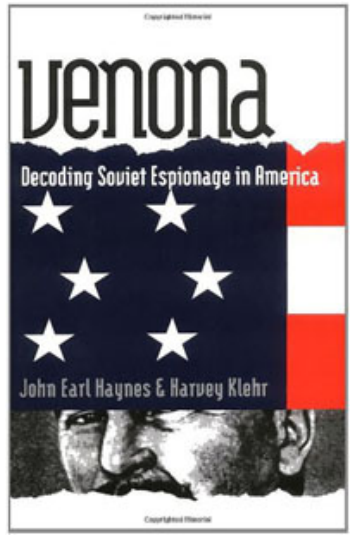
- The Old World in the New
  *The Eastern European Hebrews*
  E.A. Ross • 1914 • 5,000 Words

Similarly, Bendersky is completely out of his depth in discussing scientific issues, especially those involving anthropology and human behavior. He ridicules the "scientific racism" that he noted was widely found among the military officers he studied, claiming that such theories had already been conclusively debunked by Franz Boas and his fellow cultural anthropologists. But modern science has firmly established that the notions he so cavalierly dismisses were substantially if not entirely correct while those of Boas and his disciples were largely fallacious, and the Boasian conquest of the academic world actually imposed a half-century Dark Age upon the anthropological sciences, much like Lysenko had done in Soviet biology. Indeed, the views of Boas, an immigrant Jew, may have been primarily motivated by ideological considerations, and his most famous early work seemed to involve outright fraud: he claimed to have proven that the shape of human heads was determined by diet, and rapidly changed among immigrant groups in America.

But far more serious than Bendersky's lapses in areas outside of his professional expertise are the massive, glaring omissions found at the very heart of his thesis. His hundreds of pages of text certainly demonstrate that for decades our top military professionals were extremely concerned about the subversive activities of Jewish Communists, but he seems to casually dismiss those fears as nonsensical, almost delusional. Yet the actual facts are quite different. As I briefly noted last year after my cursory examination of his book:

> The book runs well over 500 pages, but when I consulted the index I found no mention of the Rosenbergs nor Harry Dexter White nor any of the other very numerous Jewish spies revealed by the Venona Decrypts, and the term Venona itself is also missing from the index. Reports of the overwhelmingly Jewish leadership of the Russian Bolsheviks are mostly treated as bigotry and paranoia, as are descriptions of the similar ethnic skew of America's own Communist Party, let alone the heavy financial support of the Bolsheviks by Jewish international bankers. At one point, he dismisses the link between Jews and Communism in Germany by noting that less than half of the Communist Party leadership was Jewish; but since fewer than one in a hundred Germans came from that ethnic background, Jews were obviously over-represented among Communist leaders by as much

as 5,000%. This seems to typify the sort of dishonesty and innumeracy I have regularly encountered among Jewish Holocaust experts.



Admittedly, Bendersky's book was published just 18 months after the seminal first *Venona* volume of John Earl Haynes and Harvey Klehr appeared in early 1999. But the Venona Decrypts themselves had been declassified in 1995 and soon begun circulating within the academic community. For Bendersky to stubbornly ignore the undeniable reality that a large and overwhelmingly Jewish network of Stalinist agents was situated near the top of the Roosevelt Administration, while ridiculing the military officers who made such claims at the time, raises severe doubts about his credibility as an objective historian.

As I pointed out earlier this year:

> From 1941 to 1944 FDR's Vice President was Henry Wallace, who would have succeeded to the presidency if Roosevelt had renominated him in that latter year or had died prior to early 1945. And although Wallace himself was not disloyal, his top advisors were mostly Communist agents. Indeed, he later stated that a Wallace Administration would have included Laurence Duggan as Secretary of State and Harry Dexter White as Secretary of the Treasury, thereby installing Stalinist henchmen at the top of the Cabinet, presumably supported by numerous lower-level officials of a similar political ilk. One might jokingly speculate whether the Rosenbergs—later executed for treason—would have been placed in charge of our nuclear weapons development

program.

> That America's national government of the early 1940s actually came within a hair's breadth—or rather a heart-beat—of falling under Communist control is a very uncomfortable truth. And our history books and popular media have maintained such total silence about this remarkable episode that even among today's well-educated Americans I suspect that fewer than five in one hundred are aware of this grim reality.

The Venona Project constituted the definitive proof of the massive extent of Soviet espionage activities in America, which for many decades had been routinely denied by many mainstream journalists and historians, and its findings also played a crucial secret role in dismantling that hostile spy network during the late 1940s and early 1950s. But Venona was nearly snuffed out just a year after its birth. In 1944 Soviet agents became aware of the crucial code-breaking effort, and soon afterwards arranged for the Roosevelt White House to issue a directive ordering the project shut down and all efforts to uncover Soviet spying abandoned. The only reason that Venona survived, allowing us to later reconstruct the fateful politics of that era, was that the determined Military Intelligence officer in charge of the project risked a court-martial by directly disobeying that explicit Presidential order and continuing his work.

That officer was Col. Carter W. Clarke, but his place in Bendersky's book is a much less favorable one, being described as a prominent member of the anti-Semitic "clique" who constitute the villains of the narrative. Indeed, Bendersky particularly condemns Clarke for still seeming to believe in the essential reality of the *Protocols* as late as the 1970s, quoting from a letter he wrote to a brother officer in 1977:

> If, and a big—damned big IF, as the Jews claim the Protocols of the Elders of Zion were f—- cooked up by Russian Secret Police, why is it that so much they contain has already come to pass, and the rest so strongly advocated by the *Washington Post* and the *New York Times*.

Our historians must surely have a difficult time digesting the remarkable fact that the officer in charge of the vital Venona Project, whose selfless determination saved it from destruction by the Roosevelt Administration, actually remained a lifelong believer in the importance of the *Protocols of the Elders of Zion*.

Let us take a step back and place Bendersky's findings in their proper context. We must recognize that during much of the era covered by his research, U.S. Military Intelligence constituted nearly the entirety of America's national security apparatus—being the equivalent of a combined CIA, NSA, and FBI—and was responsible for both international and domestic security, although the latter portfolio had gradually been assumed by J. Edgar Hoover's own expanding organization by the end of the 1920s.

Bendersky's years of diligent research demonstrate that for decades these experienced professionals—and many of their top commanding generals—were firmly convinced that major elements of the organized Jewish community were ruthlessly plotting to seize power in America, destroy all our traditional Constitutional liberties, and ultimately gain mastery over the entire world.

I have never believed in the existence of UFOs as alien spacecraft, always dismissing such notions as ridiculous nonsense. But suppose declassified government documents revealed that for decades nearly all of our top Air Force officers had been absolutely convinced of the reality of UFOs. Could I continue my insouciant refusal to even consider such possibilities? At the very least, those revelations would force me to sharply reassess the likely credibility of other individuals who had made similar claims during that same period.

As I wrote in 2018:

> Some years ago, I came across a totally obscure 1951 book entitled *The Iron Curtain Over America* by John Beaty, a well-regarded university professor. Beaty had spent his wartime years in Military Intelligence, being tasked with preparing the daily briefing reports distributed to all top American officials summarizing available intelligence information acquired during the previous 24 hours, which was obviously a position of considerable responsibility.
>
> As a zealous anti-Communist, he regarded much of America's Jewish population as deeply implicated in subversive activity, therefore constituting a serious threat to traditional American freedoms. In particular, the growing Jewish stranglehold over publishing and the media was making it increasingly difficult for discordant views to reach the American people, with this regime of censorship constituting the ﷺIron Curtainﷺ described in his title. He blamed Jewish interests for the totally unnecessary war with Hitler's Germany, which had long sought good relations with

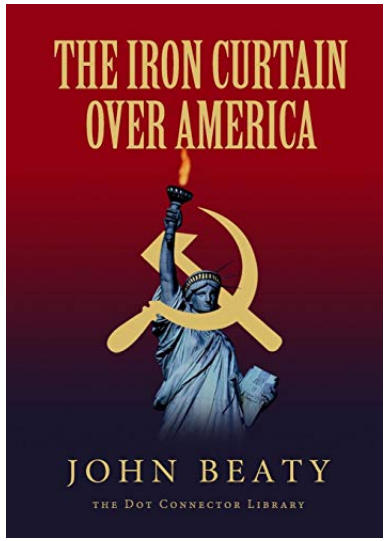
America, but instead had suffered total destruction for its strong opposition to Europe's Jewish-backed Communist menace.

Beaty also sharply denounced American support for the new state of Israel, which was potentially costing us the goodwill of so many millions of Muslims and Arabs. And as a very minor aside, he also criticized the Israelis for continuing to claim that Hitler had killed six million Jews, a highly implausible accusation that had no apparent basis in reality and seemed to be just a fraud concocted by Jews and Communists, aimed at poisoning our relations with postwar Germany and extracting money for the Jewish State from the long-suffering German people.

He was scathing toward the Nuremberg Trials, which he described as a "major indelible blot" upon America and "a travesty of justice." According to him, the proceedings were dominated by vengeful German Jews, many of whom engaged in falsification of testimony or even had criminal backgrounds. As a result, this "foul fiasco" merely taught Germans that "our government had no sense of justice." Sen. Robert Taft, the Republican leader of the immediate postwar era took a very similar position, which later won him the praise of John F. Kennedy in *Profiles in Courage*. The fact that the chief Soviet prosecutor at Nuremberg had played the same role during the notorious Stalinist show trials of the late 1930s, during which numerous Old Bolsheviks confessed to all sorts of absurd and ridiculous things, hardly enhanced the credibility of the proceedings to many outside observers.

Then as now, a book taking such controversial positions stood little chance of finding a mainstream New York publisher, but it was soon released by a small Dallas firm, and then became enormously successful, going through some seventeen printings over the next few years. According to Scott McConnell, founding editor of *The American Conservative*, Beaty's book became the second most popular conservative text of the 1950s, ranking only behind Russell Kirk's iconic classic, *The Conservative Mind*.

Bendersky devotes several pages to a discussion of Beaty's book, which he claims "ranks among the most vicious anti-Semitic diatribes of the postwar era." He also describes the story of its tremendous national success, which followed an unusual trajectory.



Books by unknown authors that are released by tiny publishers rarely sell many copies, but the work came to the attention of George E. Stratemeyer, a retired general who had been one of Douglas MacArthur's commanders, and he wrote Beaty a letter of endorsement. Beaty began including that letter in his promotional materials, drawing the ire of the ADL, whose national chairman contacted Stratemeyer, demanding that he repudiate the book, which was described as a "primer for lunatic fringe groups" all across America. Instead, Stratemeyer delivered a blistering reply to the ADL, denouncing it for making "veiled threats" against "free expression and thoughts" and trying to establish Soviet-style repression in the United States. He declared that every "loyal citizen" should read *The Iron Curtain Over America*, whose pages finally revealed the truth about our national predicament, and he began actively promoting the book around the country while attacking the Jewish attempt to silence him. Numerous other top American generals and admirals soon joined Stratemeyer in publicly endorsing the work, as did a couple of influential members of the U.S. Senate, leading to its enormous national sales.

Having now discovered that Beaty's views were so totally consistent with those of nearly all our Military Intelligence professionals, I decided to reread his short book, and found myself deeply impressed. His erudition and level-headedness were exactly what one would expect from an accomplished academic with a Columbia Ph.D. who had risen to the rank of colonel during his five years of service in Military Intelligence and on the General Staff. Although strongly anti-Communist, by all indications Beaty was very much a moderate

conservative, quite judicious in his claims and proposals. Bendersky's hysterical denunciation reflects rather badly upon the issuer of that *fatwa*.

Beaty's book was written nearly 70 years ago, at the very beginning of our long Cold War, and is hardly free from various widely-held errors of that time, nor from deep concerns about various calamities that did not come to pass, such as a Third World War. Moreover, it was published just a couple of years after Mao's victory in China and in the midst of our own involvement in the Korean War, so its discussion of those large contemporary events is far more lengthy and detailed than would probably be of interest to present-day readers. But leaving aside those minor blemishes, I think the account he provides of the true circumstances behind America's involvement in both the First and Second World Wars and their immediate aftermath is greatly superior to the heavily slanted and expurgated accounts we find in our standard history books. And Beaty's wartime responsibility for collating and summarizing all incoming intelligence information and then producing a daily digest for distribution to the White House and our other top officials surely provided him a far more accurate picture of the reality than that of the typical third-hand scribe.

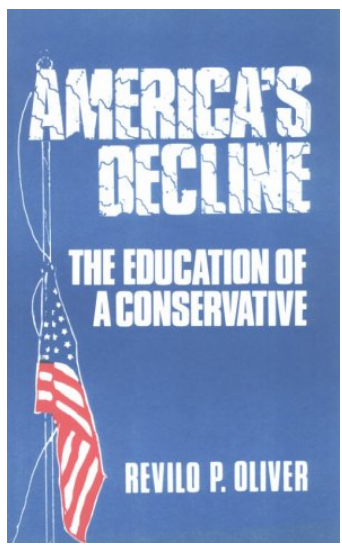
At the very least, we should acknowledge that Beaty's volume provides an excellent summary of the beliefs of American Military Intelligence officers and many of our top generals during the first half of the twentieth century. With copyright having long lapsed, I'm pleased to make it available in convenient HTML format, allowing those so interested to read it and judge for themselves:

- The Iron Curtain Over America
  John Beaty • 1951 • 82,000 Words

Despite Bendersky's fulminations, Beaty seems to have been someone of quite moderate sentiments, who viewed extremism of any type with great disfavor. After describing the ongoing seizure of power in American society by Jewish immigrants, mostly aligned with international Zionism or international Communism, his suggested responses were strikingly inoffensive. He urged American citizens to demonstrate their disapproval by writing letters to their newspapers and elected officials, signing petitions, and providing their political support to the patriotic elements of both the Democratic and Republican parties. He also argued that the most dangerous aspect of the current situation was the enfolding "Iron Curtain" of Jewish

censorship that was preventing ordinary Americans from recognizing the great looming threat to their freedoms, and claimed that combating such media censorship was a task of the highest importance.

Others of similar background and views sometimes moved in far more extreme directions. About a dozen years ago I began noticing scattered references on fringe websites to a certain Revilo P. Oliver, an oddly-named political activist of the mid-twentieth century, apparently of enormous stature in Far Right circles. According to these accounts, after important World War II service at the War Department, he began a long and distinguished career as a Classics professor at the University of Illinois. Then, beginning in the mid-1950s, he became active in politics, establishing himself as a leading figure in the early days of both *National Review* and the John Birch Society, though he eventually broke with both those organizations when he came to regard them as too politically-compromised and ineffective. Thereafter, he gradually became more angry and extreme in his views, and by 1974 had become friendly with William Pierce of the National Alliance, suggesting the theme for his novel *The Turner Diaries,* which sold hundreds of thousands of copies as a huge underground bestseller and according to federal prosecutors later served as the inspiration for the 1995 Oklahoma City bombings.



Although I had never heard of Oliver nor his unusual career, most of the facts I could verify seemed correct. The early years of *National Review* had carried more than 100 of his articles and reviews and a major feature in *The Saturday Evening Post* discussed his rancorous

break with The John Birch Society. A few years later, I became sufficiently curious that I ordered his 1981 book *America's Decline: The Education of a Conservative*, which contained his political memoir and many of his writings. So few were available, that by chance the one I received was the author's own personal copy, with his address label glued to the cover and including a few pages of his personal correspondence and errata notes sent to his publisher. These days, the numerous copies available for sale on Amazon start at an outrageous price of almost $150, but fortunately the book is also freely available for reading or downloading at Archive.org.

When I first read Oliver's book seven or eight years ago, it constituted one of my earliest exposures to the literature of the Far Right, and I was not at all sure what to make of it. His enormous classical erudition was quite apparent, but his political rhetoric seemed totally outrageous, with the word "conspiracy" used with wild abandon, seemingly on almost every other page. Given his bitter political feuds with so many other right-wingers and the total lack of any mainstream endorsements, I viewed his claims with a great deal of skepticism, though a number of them stuck in my mind. However, after having very recently absorbed the remarkable material presented by Bendersky and then reread Beaty, I decided to revisit Oliver's volume, and see what I thought of it the second time round.

[image]

Bendersky makes no mention of Oliver, which is unfortunate since all the spurious accusations he had leveled against Ross and Beaty would have been entirely correct if made against Oliver. Unlike most right-wingers, then or now, Oliver was a militant atheist, holding scathing views towards Christianity, and he instead placed racial conflict at the absolute center of his world-view, making him exactly the sort of outspoken Social Darwinist not uncommon in the early years of the twentieth century, but long since driven into hiding. A good indication of the explicit harshness of Oliver's sentiments appears on the very first page of his preface, when he ridicules the total ineffectiveness of conservatives in combating "the existing situation, which has resulted from the invasion of their country by hordes of aliens who are, by a biological necessity, their racial enemies." This sort of statement would have been unimaginable in Beaty, who emphasized Christian charity and goodwill.

More than half of the fairly long text consists of pieces that appeared

during 1955-1966 in *National Review*, *American Opinion* (the Birch magazine), and *Modern Age*, generally book reviews. Most of the topics are hardly of great current interest, and instead discuss the internal conflicts of Ancient Rome, or perhaps provide Oliver's views on Spengler, Toynbee, John Dewey, or Haitian history; but the material certainly establishes the impressive intellectual breadth of the author. According to the book's introduction, Oliver was conversant in eleven languages, including Sanskrit, and I can well credit that claim.

As mentioned, Oliver particularly despised Christianity and Christian preachers, and he devoted a substantial portion of the remainder of the book to ridiculing them and their doctrines, often deploying his great scholarship laced with crude invective, and generally writing in an arch, rather droll style. Although not of much interest to me, I'd think that those who share Oliver's religious disinclinations might find his remarks rather amusing.

However, the remaining one-third or so of the volume is focused on factual and political matters, much of the material being quite significant. According to the back cover, Oliver had spent World War II as director of a secret research group at the War Department, leading a staff that eventually grew to 175, and afterward was cited for his outstanding government service. His statements certainly present himself as extremely knowledgeable about the "hidden history" of that war, and he minced absolutely no words about his views. The combination of his strong academic background, his personal vantage point, and his extreme outspokenness would make him a uniquely valuable source on all those matters.

But that value is tempered by his credibility, cast into serious doubt by his often wild rhetoric. Whereas I would consider Beaty's book quite reliable, at least relative to the best information available at the time, and might place Henry Ford's *The International Jew* in much the same category, I would tend to be far more cautious in accepting Oliver's claims, especially given the strong emotions he expressed. Aside from his many reprinted articles, the rest of the book was written when he was in his seventies, and he repeatedly expressed his political despair concerning his many years of total failure in various right-wing projects. He declared that he had lost any hope of ever restoring the Aryan-controlled America of 1939, and instead foresaw our country's inevitable decline, alongside that of the rest of Western civilization. Moreover, many of the events he recounts had occurred three or four decades earlier, and even under the best of circumstances his recollections might have become a little garbled.

That being said, in rereading Oliver I was struck by how much of his description of America's involvement in the two world wars seemed so entirely consistent with Beaty's account, or that of numerous other highly-regarded journalists and historians of that era, such as the contributors to *Perpetual War for Perpetual Peace*. I had encountered this material some years after reading Oliver's book, and it greatly buttressed his credibility.

But unlike those other writers, Oliver often framed the same basic facts in extremely dramatic fashion. For example, he denounced Churchill's 1940 aerial bombing strategy as the most monstrous sort of war crime:

> Great Britain, in violation of all the ethics of civilized warfare that had theretofore been respected by our race, and in treacherous violation of solemnly assumed diplomatic covenants about "open cities", had secretly carried out intensive bombing of such open cities in Germany for the express purpose of killing enough unarmed and defenceless men and women to force the German government reluctantly to retaliate and bomb British cities and thus kill enough helpless British men, women, and children to generate among Englishmen enthusiasm for the insane war to which their government had committed them.
>
> It is impossible to imagine a governmental act more vile and more depraved than contriving death and suffering for its own people — for the very citizens whom it was exhorting to "loyalty" — and I suspect that an act of such infamous and savage treason would have nauseated even Genghis Khan or Hulagu or Tamerlane, Oriental barbarians universally reprobated for their insane blood-lust. History, so far as I recall, does not record that they ever butchered their own women and children to facilitate lying propaganda….In 1944 members of British Military Intelligence took it for granted that after the war Marshal Sir Arthur Harris would be hanged or shot for high treason against the British people…

At the time I originally read those words, my knowledge of World War II was mostly limited to half-remembered portions of my old History 101 textbooks, and I was naturally quite skeptical at Oliver's astonishing charges. But during subsequent years, I discovered that the circumstances were exactly as Oliver claimed, with so notable a historian as David Irving having fully documented the evidence. So although we may question Oliver's exceptionally harsh characterization or his heated rhetoric, the factual case he makes

seems not to be under serious dispute.

His discussion of America's own entrance in the war is equally strident. He emphasizes that his colleagues in the War Department had completely broken the most secure Japanese codes, giving our government complete knowledge of all Japanese plans:

> Perhaps the most exhilarating message ever read by American Military Intelligence was one sent by the Japanese government to their Ambassador in Berlin (as I recall), urging him not to hesitate to communicate certain information by telegrams and assuring him that "no human mind" could decipher messages that had been enciphered on the Purple Machine. That assurance justified the merriment it provoked…

However, just as many others have alleged, Oliver claims that Roosevelt then deliberately allowed the attack on Pearl Harbor to proceed and failed to warn the local military commanders, whom he then ordered court-martialed for their negligence:

> Everyone *now* knows, of course, that the message to the Japanese Ambassador in Washington, warning him that Japan was about to attack the United States, was read by Military Intelligence not long after the Ambassador himself received it, and that the frantic cover-up, involving some successful lying about details, was intended, not to preserve that secret, but to protect the traitors in Washington who made certain that the Japanese attack, which they had labored so long to provoke, would be successful and produce the maximum loss of American lives and destruction of American ships.

Numerous historians seem to have thoroughly established that Roosevelt did everything he could to provoke a war with Japan. But Oliver adds a fascinating detail that I have never seen mentioned elsewhere:

> In January 1941, almost eleven months before Pearl Harbor, preparation for it began in Washington when Franklin D Roosevelt summoned the Portuguese Ambassador to the United States and, enjoining him to the utmost secrecy, asked him to inform Premier Salazar that Portugal need have no concern for the safety of Timor and her other possessions in Southeast Asia; the United States, he said, had decided to crush Japan forever by waiting until her military forces and lines of communication were stretched to the utmost and then suddenly launching an all-out

> war with massive attacks that Japan was not, and could not be, prepared to resist. As expected, the Portuguese Ambassador communicated the glad tidings to the head of his government, using his most secure method of communication, an enciphered code which the Portuguese doubtless imagined to be "unbreakable," but which Roosevelt well knew had been compromised by the Japanese, who were currently reading all messages sent in it by wireless. The statement, ostensibly entrusted in "strict secrecy" to the Portuguese Ambassador, was, of course, intended for the Japanese government, and, as a matter of fact, it became certain that the trick had succeeded when the contents of the Portuguese Ambassador's message to Salazar promptly appeared in a Japanese message enciphered by the Purple Machine. Roosevelt had only to wait for Japan to act on the "secret" information about American plans thus given her, and to order naval movements and diplomatic negotiations that would appear to the Japanese to confirm American intentions.
>
> The fact that I have just mentioned is really the ultimate secret of Pearl Harbor, and seems to have been unknown to Admiral Theobald when he wrote his well-known book on the subject.

Oliver notes that Roosevelt had long sought to have America participate in the great European war whose outbreak he had previously orchestrated, but had been blocked by overwhelming domestic anti-war sentiment. His decision to provoke a Japanese attack as a "back door" to war only came after all his military provocations against Germany had failed to accomplish a similar result:

> His first plan was defeated by the prudence of the German government. While he yammered about the evils of aggression to the white Americans whom he despised and hated, Roosevelt used the United States Navy to commit innumerable acts of stealthy and treacherous aggression against Germany in a secret and undeclared war, hidden from the American people, hoping that such massive piracy would eventually so exasperate the Germans that they would declare war on the United States, whose men and resources could then be squandered to punish the Germans for trying to have a country of their own. These foul acts of the War Criminal were known, of course, to the officers and men of the Navy that carried out the orders of their Commander-in-Chief, and were commonly discussed in informed circles, but, so far as I know, were first and much belatedly chronicled by Patrick Abbazia in *Mr. Roosevelt's Navy: the Private War of the U.S.*

*Atlantic Fleet, 1939-1942*, published by the Naval Institute Press in Annapolis in 1975.

…Although the U.S. Navy's acts of outrageous piracy on the high seas were successfully concealed from the majority of the American people before Pearl Harbor, they were, of course, well known to the Japanese, and partly account for Roosevelt's success in deceiving them with his "confidences" to the Portuguese Ambassador…they assumed that when Roosevelt was ready to attack them, his power over the American press and communications would enable him to simulate an attack they had not in fact made. That the deception was successful was, of course, shown in December 1941, when they made a desperate effort to avert the treacherous blow they feared.

Once America thus entered the war, Oliver then focuses on the horrific way the Allies waged it, using aerial bombardment to deliberately slaughter the civilian population of Germany:

Both British and Americans have always claimed to be humane and have loudly condemned unnecessary bloodshed, mass massacres, and sadistic delight in the infliction of pain…in 1945 their professions could still be credited without doubt, and that meant they would be stricken with remorse for a ferocious act of unmitigated savagery unparalleled in the history of our race and unsurpassed in the record of any race. The bombing of the unfortified city of Dresden, nicely timed to insure an agonizing death to the maximum number of white women and children, has been accurately described by David Irving in *The Destruction of Dresden* (London, 1963), but the essentials of that sickening atrocity were known soon after it was perpetrated. To be sure, it is true that such an act might have been ordered by Hulagu, the celebrated Mongol who found pleasure in ordering the extermination of the population of all cities that did not open their gates to him — and of some that did — so that the severed heads of the inhabitants could be piled up into pyramids as perishable but impressive monuments to his glory. The Americans and British, however, deem themselves more civilized than Hulagu and less sadistic.

He also harshly condemns the very brutal nature of the American occupation of Germany that followed the end of the war:

…with the American invasion of German territory began the innumerable atrocities against her civilian population — the

> atrocities against prisoners began even earlier — that have brought on our people the reputation of Attila's hordes. The outrages were innumerable and no one, so far as I know, has even tried to compile a list of typical incidents of rape and torture and mayhem and murder. Most of the unspeakable atrocities, it is true, were committed by savages and Jews in American uniforms, but many, it must be confessed, were perpetrated by Americans, louts from the dregs of our own society or normal men crazed with hatred. All victorious armies, it is true, contain elements that want to outrage the vanquished, and few commanders in "democratic" wars can maintain the tight discipline that made Wellington's armies the marvels of Europe or the discipline that generally characterized the German armies in both World Wars; what so brands us with shame is that the atrocities were encouraged by our supreme commander in Europe, whose orders, presumably issued when he was not drunk or occupied with his doxies, made it difficult or hazardous for responsible American generals to observe what had been the rules of civilized warfare. Almost every American soldier in Germany had witnessed the barbarous treatment of the vanquished, the citizens of one of the greatest nations of Western civilization and our own kinsmen, and — despite the efforts to incite them to inhuman hate with Jewish propaganda — many of our soldiers witnessed such outrages with pity and shame. The cumulative effect of their reports when they returned to their own country should have been great. It is needless to multiply examples, some of which may be found in F.J.P. Veale's *Advance to Barbarism* (London, 1953).

And he suggests that the Nuremberg Tribunals brought everlasting shame upon his own country:

> I was, of course, profoundly shocked by the foul murders at Nuremberg that brought on the American people an indelible shame. Savages and Oriental barbarians normally kill, with or without torture, the enemies whom they have overcome, but even they do not sink so low in the scale of humanity as to perform the obscene farce of holding quasi-judicial trials before they kill, and had the Americans — for, given their absolute power, the responsibility must fall on them, and their guilt cannot be shifted to their supposed allies — had the Americans, I say, merely slaughtered the German generals, they could claim to be morally no worse than Apaches, Balubas, and other primitives. Civilized peoples spare the lives of the vanquished, showing to their leaders a respectful consideration, and the deepest instincts of our race demand a chivalrous courtesy to brave opponents whom the

fortunes of war have put in our power.

To punish warriors who, against overwhelming odds, fought for their country with a courage and determination that excited the wonder of the world, and deliberately to kill them because they were not cowards and traitors, because they did not betray their nation — that was an act of vileness of which we long believed our race incapable. And to augment the infamy of our act, we stigmatized them as "War Criminals" which they most certainly were not, for if that phrase has meaning, it applies to traitors who knowingly involve their nations in a war contrived to inflict loss, suffering, and death on their own people, who are thus made to fight for their own effective defeat — traitors such as Churchill, Roosevelt, and their white accomplices. And to add an ultimate obscenity to the sadistic crime, "trials" were held to convict the vanquished according to "laws" invented for the purpose, and on the basis of perjured testimony extorted from prisoners of war by torture…

…The moral responsibility for those fiendish crimes, therefore, falls on our own War Criminals, and, as a practical matter, nations always bear the responsibility for the acts of the individuals whom they, however mistakenly, placed in power. We cannot reasonably blame Dzhugashvili, alias Stalin: he was not a War Criminal, for he acted, logically and ruthlessly, to augment the power and the territory of the Soviet Empire, and he (whatever his personal motives may have been) was the architect of the regime that transformed a degraded and barbarous rabble into what is now the greatest military power on earth.

Oliver's memoirs were published by a tiny London press in a cheap paper binding, lacked even an index, and were hardly likely to ever reach a substantial audience. That, together with the internal evidence of his text, leads me to believe that he was quite sincere in his statements, at least with regard to all these sorts of historical and political matters. And given those beliefs, we should hardly be surprised at the heated rhetoric he directs against the targets of his wrath, especially Roosevelt, whom he repeatedly references as "the great War Criminal."

Sincerity is obviously no guarantee of accuracy. But Bendersky's extensive review of private letters and personal memoirs reveals that a large portion of our Military Intelligence officers and top generals seemed to closely share Oliver's appraisal of Roosevelt, whose eventual death provoked widespread "exultation" and "fierce delight"

in their social circle. Finally, one of them wrote, “The evil man was dead!”

Moreover, although Oliver’s words are as heated as those of Beaty are measured, the factual claims of the two authors are quite similar with regard to World War II, so that all the high-ranking generals who enthusiastically endorsed Beaty’s bestselling 1951 book may be regarded as providing some implicit backing for Oliver.

Consider also the personal diaries and reported conversations of Gen. George S. Patton, one of our most renowned field commanders. These reveal that shortly after the end of fighting he became outraged over how he had been totally deceived regarding the circumstances of the conflict, and he planned to return to the U.S., resign his military commission, and begin a national speaking-tour to provide the American people with the true facts about the war. Instead, he died in a highly-suspicious car accident the day before his scheduled departure, and there is very considerable evidence that he was actually assassinated by the American OSS.

Oliver’s discussion of the Second World War provides remarkably vivid rhetorical flourishes and some intriguing details, but his basic analysis is not so different from that of Beaty or numerous other writers. Moreover, Beaty had a far superior vantage point during the conflict, while his book was published just a few years after the end of fighting and was also far more widely endorsed and distributed. So although Oliver’s extreme candor may add much color to our historical picture, I think his memoirs are probably more useful for their other elements, such as his unique insights into the origins of both *National Review* and the John Birch Society, two of the leading right-wing organizations established during the 1950s.

Oliver opens his book by describing his departure from DC and wartime government service in the fall of 1945, fully confident that the horrific national treachery he had witnessed at the top of the American government would soon inspire “a reaction of national indignation that would become sheer fury.” As he puts it:

> That reaction, I thought, would occur automatically, and my only concern was for the welfare of a few friends who had innocently and ignorantly agitated for war before the unspeakable monster in the White House successfully tricked the Japanese into destroying the American fleet at Pearl Harbor. I wondered

> whether a plea of ignorance would save them from the reprisals I foresaw!

He spent the next decade entirely engaged in his Classical scholarship and establishing an academic career, while noting some of the hopeful early signs of the political uprising that he fully expected to see:

> In 1949 Congressman Rankin introduced a bill that would recognize as subversive and outlaw the "Anti-"Defamation League of B'nai B'rith, the formidable organization of Jewish cowboys who ride herd on their American cattle…In both the Houses of Representatives and the Senate committees were beginning investigations of covert treason and alien subversion…Then Senator McCarthy undertook a somewhat more thorough investigation, which seemed to open a visible leak in the vast dike of deceit erected by our enemies, and it was easy to assume that the little jet of water that spurted through that leak would grow hydraulically until the dam broke and released an irresistible flood.

However, by 1954 he recognized that McCarthy's political destruction was at hand, and the opposing forces he so despised had gained the upper hand. He faced the crucial decision of whether to involve himself in politics, and if so, what form that might take.

One of his friends, a right-wing Yale professor named Wilmoore Kendall, argued that a crucial factor in the Jewish domination of American public life was their control over influential opinion journals such as *The Nation* and *The New Republic*, and that launching a competing publication might be the most effective remedy. For this purpose, he had recruited a prize student of his named William F. Buckley, Jr., who could draw upon the financial resources of his wealthy father, long known in certain circles for his discreet sponsorship of various anti-Jewish publications and "his drastic private opinion about the aliens' perversion of our national life."

A few years earlier, H.L. Mencken's famous literary monthly *The American Mercury* had fallen on hard times and been purchased by one of America's wealthiest men, Russell Maguire, who hoped to use it partly as a vehicle for his extremely strong anti-Jewish sentiments. Indeed, one of Maguire's senior staffers for a couple of years was George Lincoln Rockwell, best known for later founding the American Nazi Party. But according to Oliver, enormous concerted pressure by Jewish interests upon both newstands and printers had caused great difficulties for that publication, which were to eventually force

Maguire to abandon the effort and sell the magazine.

Kendall and Oliver hoped that Buckley's new effort might succeed where Maguire's was failing, perhaps by avoiding any direct mention of Jewish issues and instead focusing upon threats from Communists, socialists, and liberals, who were far less risky targets to attack. Buckley had previously gained some journalistic experience by working at the *Mercury* for a couple of years, so he was probably well aware of the challenging political environment he might face.

Although L. Brent Bozell, another one of his young Yale proteges, would also be working with Buckley on the new venture, Kendall told Oliver that he had failed to locate a single university professor willing to risk his name as a contributor. This prompted Oliver to take up the challenge with such determination that more of his pieces appeared in *National Review* during the 1950s than almost any other writer, even ahead of Kendall himself. Apparently Oliver had already become friendly with Buckley, having been a member of the latter's 1950 wedding party.

But from Oliver's perspective, the project proved a dismal failure. Against all advice, Buckley founded his magazine as a profit-making enterprise, circulating a prospectus, selling stock and debentures, and promising his early backers an excellent financial return. Instead, like every other political magazine, it always lost money and was soon forced to plead for donations, greatly irritating his initial investors.

Another concern was that just before launch, a couple of Jewish former Communists then running an existing conservative magazine caught wind of the new publication and offered to betray their employer and bring over all their existing subscribers if they were given senior roles. Although they were duly brought on board, their planned coup at *The Freeman* failed, and no promised bounty of subscribers appeared. In later hindsight, Oliver became deeply suspicious of these developments and how the publication had been so quickly diverted from its intended mission, writing:

> …it was only long after Professor Kendall had been shouldered out of the organization and I had severed my connections with it that I perceived that whenever a potentially influential journal is founded, it receives the assistance of talented "conservative" Jews, who are charged with the duty of supervising the Aryan children and making certain that they play only approved games.

Oliver also emphasized the severe dilemma faced by the magazine and

all other organizations intended to combat the influence of Jews and Communists. For obvious reasons, these almost invariably centered themselves around strong support for Christianity. But Oliver was a militant atheist who detested religious faith and therefore believed that such an approach inevitably alienated "the very large number of educated men who…were repelled by the hypocrisy, obscurantism, and rabid ambitions of the clergy." Thus, Christian anti-Communist movements often tended to produce a large backlash of sympathy for Communism in elite circles.

Small ideological publications are notorious for their bitter intrigues and angry disputes, and I have made no effort to compare Oliver's brief sketch of the creation of *National Review* with other accounts, which would surely provide very different perspectives. But I think his basic facts ring true to me.

By 1958 Oliver had established himself as one of *National Review*'s leading contributors, and he was contacted by a wealthy Massachusetts businessman named Robert Welch, who had been an early investor in the magazine but was greatly disappointed by its political ineffectiveness, so the two men corresponded and gradually became quite friendly. Welch said he was concerned that the publication focused largely on frivolity and pseudo-literary endeavors, while it increasingly minimized or ignored the conspiratorial role of the Jewish aliens who had gained such a degree of control over the country. The two men eventually met, and according to Oliver seemed to be entirely in agreement about America's plight, which they discussed in complete candor.

Late that same year, Welch described his plans for regaining control of the country by the creation of a semi-secret national organization of patriotic individuals, primarily drawn from the upper middle classes and prosperous businessmen, which eventually became known as the John Birch Society. With its structure and strategy inspired by the Communist Party, it was to be tightly organized into individual local cells, whose members would then establish a network of front organizations for particular political projects, all seemingly unconnected but actually under their dominant influence. Secret directives would be passed along to each local chapter by the word of mouth via coordinators dispatched from Welch's central headquarters, a system also modeled after the strict hierarchical discipline of Communist movements.

Welch privately unveiled his proposal to a small group of prospective co-founders, all of whom with the exception of Oliver were wealthy businessmen. He candidly admitted his own atheism and explained that Christianity would have no role in the project, which cost him a couple of potential supporters; but about a dozen committed themselves, notably including Fred Koch, founding father of Koch Industries. Minimal emphasis was to be placed upon Jewish matters, partly to avoid drawing media fire and partly in hopes that a growing schism between Zionist and non-Zionist Jews might weaken their powerful adversary, or if the former gained the upper hand, perhaps help ensure the removal of all Jews to the Middle East.

As the project moved forward, a monthly magazine called *American Opinion* was launched and Oliver took responsibility for a large portion of each issue. Given his academic and political prominence, he also became one of the leading speakers for the organization in public venues and also an influential visitor to many of its local chapters.

Although Oliver remained a top figure in the organization until 1966, in later years he concluded that Welch's serious mistakes had doomed the project to failure within just a couple of years after its establishment. Very early on, a Jewish journalist had obtained a copy of some of Welch's secret, controversial writings and their public disclosure had panicked one of the most prominent Birch leaders, soon producing a major media scandal. Welch repeatedly vacillated between defending and denying his secret manuscript, forcing his associates to take contradictory positions, and making the entire leadership seem both dishonest and ridiculous, a pattern that was to be repeated in future years.

According to Oliver, nearly eighty thousand men and women enlisted in the organization during the first decade, but he feared that their energetic efforts and commitment were entirely wasted, producing nothing of any value. As the years went by, the organization's ineffectiveness became more apparent, while Welch's autocratic control blocked any necessary changes from within since his executive council functioned merely as a powerless fig-leaf. Although Oliver remained convinced that Welch had been sincere when he began the effort, the accumulation of so many unnecessary missteps eventually led him to suspect deliberate sabotage. He claimed that his careful investigation revealed that the organization's financial problems had forced Welch to turn in desperation to outside Jewish donors, who then became his secret overlords, eventually leading Oliver to rancorously break with the organization in 1966 and denounce it as a

fraud. Although I have no easy means of verifying most of Oliver's claims, his story hardly seems implausible.

Oliver also makes an important point about the severe dilemma produced by Welch's strategy. One of the central goals of the organization had been to combat organized Jewish influence in America, but any mention of Jews was forbidden, so the officially designed term for their subversive foes was the "International Communist Conspiracy." Oliver admitted that the usage of that ubiquitous phrase became "forced" and "monotonous," and indeed it or its variants appear with remarkable regularity in his articles reprinted from the Birch magazine.

According to Oliver, the intent was to allow members to draw their own logical conclusions about who was really behind the "conspiracy" they opposed while allowing the organization itself to maintain plausible deniability. But the result was total failure, with Jewish organizations fully understanding the game being played, while intelligent individuals quickly concluded that the Birch organization was either dishonest or delusional, hardly an unreasonable inference. As an example of this situation, the late investigative journalist Michael Collins Piper in 2005 told the story of how at the age of sixteen he had embraced a 'One-Minute' Membership in the John Birch Society. Indeed, by the late 1960s, any public expressions of anti-Semitism by Birch members became grounds for immediate expulsion, a rather ironic situation for an organization originally founded just a decade earlier with avowedly anti-Semitic goals.

Following his 1966 rupture with Welch, Oliver greatly reduced his political writing, which henceforth only appeared in much smaller and more extreme venues than the Birch magazine. His book contains just a couple of such later pieces, but the second of these, published in a right-wing British magazine during 1980, is of some interest.

Just as we might expect, Oliver had always been particularly scathing towards the supposed Jewish Holocaust, and near the very beginning of his book, he states his own views in typically forceful fashion:

> The Americans…were howling with indignation over the supposed extermination by the Germans of some millions of Jews, many of whom had taken the opportunity to crawl into the United States, and…one could have supposed in 1945 that when the hoax, devised to pep up the cattle that were being stampeded

into Europe, was exposed, even Americans would feel some indignation at having been so completely bamboozled.

The prompt exposure of the bloody swindle seemed inevitable, particularly since the agents of the O.S.S., commonly known in military circles as the Office of Soviet Stooges, who had been dispatched to conquered Germany to set up gas chambers to lend some verisimilitude to the hoax, had been so lazy and feckless that they merely sent back pictures of shower baths, which were so absurd that they had to be suppressed to avoid ridicule. No one could have believed in 1945 that the lie would be used to extort thirty billion dollars from the helpless Germans and would be rammed into the minds of German children by uncouth American "educators" — or that civilized men would have to wait until 1950 for Paul Rassinier, who had been himself a prisoner in a German concentration camp, to challenge the infamous lie, or until 1976 for Professor Arthur Butz's detailed and exhaustive refutation of the venomous imposture on Aryan credulity.

- The Hoax of the Twentieth Century
  *The Case Against the Presumed Extermination of European Jewry*
  Arthur R. Butz • 1976/2015 • 225,000 Words

In his republished article, Oliver discussed this same topic at far greater length and in the context of its broader theoretical implications. After recounting various examples of historical frauds and cover-ups, starting with the possibly forged letter of the younger Pliny, he expressed his amazement at the continuing widespread acceptance of the Holocaust story, despite the existence of hundreds of thousands of direct eyewitnesses to the contrary. He suggested that such an astonishing scholarly situation must force us to reassess our assumptions about the nature of evidentiary methods in historiography.

Oliver's peremptory dismissal of the standard Holocaust narrative led me to take a closer look at the treatment of the same topic in Bendersky's book, and I noticed something quite odd. As discussed above, his exhaustive research in official files and personal archives conclusively established that during World War II a very considerable fraction of all our Military Intelligence officers and top generals were vehemently hostile to Jewish organizations and also held beliefs that today would be regarded as utterly delusional. The author's academic specialty is Holocaust studies, so it is hardly surprising that his longest chapter focused on that particular subject, bearing the title "Officers and the Holocaust, 1940-1945." But a close examination of the

contents raises some troubling questions.

Across more than sixty pages, Bendersky provides hundreds of direct quotes, mostly from the same officers who are the subject of the rest of his book. But after carefully reading the chapter twice, I was unable to find a single one of those statements referring to the massive slaughter of Jews that constitutes what we commonly call the Holocaust, nor to any of its central elements, such as the existence of death camps or gas chambers.

The forty page chapter that follows focuses on the plight of the Jewish "survivors" in post-war Europe, and the same utter silence applies. Bendersky is disgusted by the cruel sentiments expressed by these American military men towards the Jewish former camp inmates, and he frequently quotes them characterizing the latter as thieves, liars, and criminals; but the officers seem strangely unaware that those unfortunate souls had only just barely escaped an organized mass extermination campaign that had so recently claimed the lives of the vast majority of their fellows. Numerous statements and quotes regarding Jewish extermination are provided, but all of these come from various Jewish activists and organizations, while there is nothing but silence from all of the military officers themselves.

Bendersky's ten years of archival research brought to light personal letters and memoirs of military officers written decades after the end of the war, and in both those chapters he freely quotes from these invaluable materials, sometimes including private remarks from the late 1970s, long after the Holocaust had become a major topic in American public life. Yet not a single statement of sadness, regret, or horror is provided. Thus, a prominent Holocaust historian spends a decade researching a book about the private views of our military officers towards Jews and Jewish topics, but the one hundred pages he devotes to the Holocaust and its immediate aftermath contains not a single directly-relevant quote from those individuals, which is simply astonishing. A yawning chasm seems to exist at the center of his lengthy historical volume, or put another way, a particular barking dog is quite deafening in its silence.

I am not an archival researcher and have no interest in reviewing the many tens of thousands of pages of source material located at dozens of repositories across the country that Bendersky so diligently examined while producing his important book. Perhaps during their entire wartime activity and also the decades of their later lives, not a single one of the hundred-odd important military officers who were the focus of his investigation ever once broached the subject of the

Holocaust or the slaughter of Jews during World War II. But I think there is another distinct possibility.

As mentioned earlier, Beaty spent his war years carefully reviewing the sum-total of all incoming intelligence information each day and then producing an official digest for distribution to the White House and our other top leaders. And in his 1951 book, published just a few years after the end of fighting, he dismissed the supposed Holocaust as a ridiculous wartime concoction by dishonest Jewish and Communist propagandists that had no basis in reality. Soon afterward, Beaty's book was fully endorsed and promoted by many of our leading World War II generals, including those who were subjects of Bendersky's archival research. And although the ADL and various other Jewish organizations fiercely denounced Beaty, there is no sign that they ever challenged his absolutely explicit "Holocaust denial."

I suspect that Bendersky gradually discovered that such "Holocaust denial" was remarkably common in the private papers of many of his Military Intelligence officers and top generals, which presented him with a serious dilemma. If only one or two of those individuals had expressed such sentiments, their shocking statements could be cited as further evidence of their delusional anti-Semitism. But what if a substantial majority of those officers—who certainly had possessed the best knowledge of the reality of World War II—held private beliefs that were very similar to those publicly expressed by their former colleagues Beaty and Oliver? In such a situation, Bendersky may have decided that certain closed doors should remain in that state, and entirely skirted the topic.

At the age of 89, Richard Lynn surely ranks as the "grand old man" of IQ research, and in 2002 he and his co-author Tatu Vanhanen published their seminal work *IQ and the Wealth of Nations*. Their volume strongly argued that mental ability as measured by standardized tests was overwhelmingly determined by hereditary genetic factors, and for nearly two decades their research findings have constituted a central pillar of the IQ movement that they have long inspired. But as I argued in a major article several years ago, the massive quantity of evidence they presented actually demonstrates the exact opposite conclusion:

> We are now faced with a mystery arguably greater than that of IQ itself. Given the powerful ammunition that Lynn and Vanhanen have provided to those opposing their own Strong IQ

> Hypothesis,[illegible] we must wonder why this has never attracted the attention of either of the warring camps in the endless, bitter IQ dispute, despite their alleged familiarity with the work of these two prominent scholars. In effect, I would suggest that the heralded 300-page work by Lynn and Vanhanen constituted a game-ending own-goal against their IQ-determinist side, but that neither of the competing ideological teams ever noticed.

For ideologically-blinkered scholars to sometimes produce research that constitutes "a game-ending own-goal" may be much more common than most of us would expect. Janet Mertz and her zealously feminist co-authors expended enormous time and effort to conclusively establish that across nearly all nations of the world, regardless of culture, region, or language, the group of highest-performing math students has almost always been roughly 95% male and just 5% female, a result that would seem to deeply undercut their hypothesis that men and women have equal mathematical ability.

Similarly, ten years of exhaustive archival research by Joseph Bendersky produced a volume that seems to utterly demolish our conventional narrative of Jewish political activism in both Europe and America between the two world wars. Moreover, when carefully considered I think his text constitutes a dagger aimed with deadly accuracy straight at the heart of our conventional Holocaust narrative, his own lifelong area of study and a central pillar of the West's current ideological framework.

Over the last year or two, pressure from the ADL and other Jewish activist organizations has induced Amazon to ban all books that challenge the Holocaust or other beliefs deeply held by organized Jewry. Most of these purged works are quite obscure, and many are of indifferent quality. Moreover, their public impact has been severely diminished by the real or perceived ideological associations of their authors.

Meanwhile, for nearly twenty years a book of absolutely devastating historical importance has sat on the Amazon shelves, freely available for sale and bearing glowing cover-blurbs by mainstream, reputable scholars, but by its Amazon sales-rank, selling almost no copies, a massive, unexploded shell whom nearly no one seems to have properly recognized. I suggest that interested readers purchase their copies of Bendersky's outstanding opus before steps are taken to permanently flush it down the memory hole.

# The Power of Organized Crime

*How a Young Syndicate Lawyer from Chicago Earned a Fortune Looting the Property of the Japanese-Americans, then Lived Happily Ever After as America's Most Respected Civil Libertarian Federal Appellate Court Judge*

July 15, 2019 • 13,000 Words

*The Honorable David L. Bazelon, Chief Judge of the U.S. Court of Appeals for the District of Columbia*

As I was growing up in the suburban San Fernando Valley of Los Angeles during the 1960s and 1970s, organized crime seemed like a very distant thing, confined to the densely-populated cities of the East Coast or to America's past, much like the corrupt political machines with which it was usually associated.

I never heard any stories of ballot-box stuffing or political precinct captains controlling a swath of no-show city jobs or traffic tickets being "fixed" by a friend at City Hall. The notion of local grocery stores paying protection money or taking numbers bets from their

clientele on behalf of bookies would have seemed quite outlandish to me.

All these personal impressions were strongly reinforced by the electronic media that so heavily shapes our perceptions of reality. A couple of the popular shows I sometimes watched in reruns were the police procedural dramas *Dragnet* and *Adam-12*, both set in Southern California, and although each episode focused on one or more serious crimes, these were almost never of the "organized" variety. The same was true for *Perry Mason* episodes, although those longer courtroom dramas would have been naturally suited to the plotting of Syndicate members. The popular *Rockford Files* of the late 1970s did sometimes feature mobsters, but these individuals were almost always temporary visitors to LA from New York or Chicago or Las Vegas, with the plotlines sometimes humorously treating these gangsters as struggling fish out of water in the very different world of sunny Southern California. By contrast, a contemporaneous detective show set in New York like *Kojak* seemed to feature mafioso characters in every third or fourth episode.

The offerings of the Silver Screen generally followed the same pattern. Gangster films, ranging from the crudest B-flicks to the Academy Award-winning *Godfather* masterpieces, were almost never set on the West Coast. And although a film like Roman Polanski's *Chinatown* might be focused on the deadly criminal intrigues of the 1930s Los Angeles financial elites, the villain was just a ruthless businessman, employing a couple of murderous hired thugs.

Children soon become aware that the dramatic concoctions of Hollywood are not necessarily accurate, but when everything we see on screens big and small so closely matches our direct personal experience, that amalgamation of images and daily life produces a very firm sense of reality.

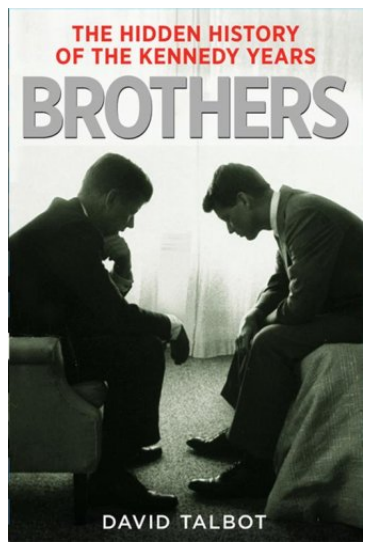
Even the occasional exception seemed to support the general rule. In the 1970s, I remember once watching a local television news crew interview an elderly Jewish man named Mickey Cohen on a local park bench, breathlessly describing him as having once been the reigning mobster king of Los Angeles. While I didn't doubt that in bygone days the crotchety little fellow had once been a hardened criminal, I remained somewhat skeptical that LA had ever contained enough mobsters to warrant having a king, let alone that such a figure would have been drawn from our notoriously law-abiding Jewish community.

Throughout the 1960s and 1970s crime became a steadily rising problem in the once-quiet suburbs of Los Angeles, but virtually none of those incidents seemed much like a Francis Ford Coppola epic. The Crips and Bloods of South-Central regularly killed each other and innocent bystanders, while burglaries and robberies—as well as occasional rapes and murders—sometimes spilled over the Hollywood Hills into the Valley. Terrifying serial killers like the Hillside Strangler provoked widespread fear as did the horrible deeds of the Manson Family, while the fiery final shootout of the Symbionese Liberation Army near Inglewood drew national headlines; but none of this seemed much like the activities of the Gambinos or Columbos of NYC. Indeed, I and my friends would sometimes joke that since the Mafia was supposedly so effective at keeping street crime away from its own New York City neighborhoods, perhaps LA would have been better off if it had had a sizeable Sicilian population.

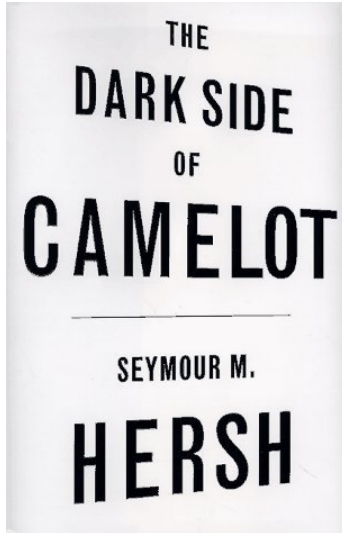
When I sometimes gave the matter a little thought, the utter lack of any organized crime in California seemed fairly easy to explain. East Coast cities had been settled by waves of foreign immigrants, impoverished newcomers who spoke no English, and their total ignorance of American ways left them quite vulnerable to criminal exploitation. Such situations were an ideal breeding ground for corruption, political machines, and crime syndicates, with the centuries-old secret societies of Sicily and Southern Italy providing the obvious seeds for the last of those. Meanwhile, most of California had been settled by longstanding American citizens, often relocating from the placid Midwest, and Iowans who spoke perfect English and whose families had been voting in U.S. elections for six generations were far less vulnerable to political intimidation or criminal exploitation.

Since organized crime obviously did not exist in California, I was never quite sure how much to believe about its supposed size and power elsewhere in the country. Al Capone had been imprisoned and died decades before I was born and with the end of Roaring Twenties, violent gangsterism seemed to have mostly disappeared as well. Every now and then the newspapers might carry the story of an Eastern Mafia chieftain killed by his rivals, but those occasional events provided little indication about the actual power those individuals had wielded while alive. In 1977, teenage members of an obscure Chinese immigrant street gang in San Francisco used automatic weapons to attack their rivals at a local restaurant, leaving sixteen dead or wounded, a body-count that seemed comparable to the total number of traditional Mafia killings nationwide over a period of several years.

During the 1970s I also starting hearing lurid tales that the Mafia had stolen the 1960 election for President John F. Kennedy and might even have been involved in his subsequent assassination, but the respectable media seemed to treat those claims with enormous scorn, so I tended to regard them as *National Enquirer* type nonsense, not much different than ridiculous UFO stories. Growing up when I did, the Kennedys had seemed like America's own royal family, and I was very skeptical that control of the White House at the absolute height of the American Century had been swung by Mafia bosses. There were stories that Old Joe Kennedy, the family patriarch, had dabbled in bootlegging during the 1920s, but that had been during Prohibition, a very different era than the aftermath of the quiet and prosperous Eisenhower years of the 1950s.



Twentieth century American history had never been of much interest to me, so I am not entirely sure at what point my understanding of these issues began to change. I think it may have been just a few years ago, when I was absolutely shocked to discover that there was overwhelming evidence that the JFK Assassination had indeed been part of a large conspiracy, a revelation absolutely contrary to what I had always been led to believe by the media throughout my life. But when a highly-regarded national journalist such as David Talbot gathered together the copious evidence in his book *Brothers*, and his conclusions were endorsed by an eminent presidential historian such as Alan Brinkley writing in the pages of the august *New York Times*, such a shift became unavoidable. And it seemed clear that elements of organized crime had been heavily involved in that presidential assassination.



My awakening to the reality of the JFK Assassination took some time to digest, but a year or so later I began investigating that era more carefully, and decided to finally read *The Dark Side of Camelot,* a huge 1997 bestseller by Seymour Hersh, perhaps our most renowned investigative journalist. Although it focused primarily on the long-suppressed misdeeds of the Kennedy Administration and only lightly touched upon the assassination that ended it, nearly all of the material seemed very consistent with what I had recently read in the other books centered entirely upon the 1963 events in Dallas. And the longtime relationship between the Kennedys and organized crime, sometimes hostile and sometimes friendly, was absolutely eye-opening for what it revealed about the immense hidden power of that latter social institution.

When several highly-regarded journalists come to identical conclusions and back their shocking claims with copious credible evidence, we must accept the reality of what they have presented.

For example, it seems absolutely undeniable that the Chicago Syndicate helped steal the 1960 election for Kennedy, using their control over the election machinery of that extremely corrupt city to carry Illinois's crucial 27 electoral votes and place JFK in the White House instead of his opponent Vice President Richard Nixon.

That outcome had been accomplished through the intense personal lobbying of top mob bosses by Joseph Kennedy, Sr. His efforts were greatly assisted by the advocacy of singer Frank Sinatra, an entertainer with strong personal ties both to the Kennedys and the underworld, and the Syndicate believed they had an understanding

that a victorious Kennedy Administration would go easy on them. But instead, newly appointed Attorney-General Robert Kennedy redoubled the government's war on organized crime, leading outraged mob boss Sam Giancana to nearly order the killing of Sinatra in retaliation. Certainly the perceived betrayal greatly facilitated the involvement of various gangster elements in the subsequent Dallas assassination.

Ironically enough, organized crime itself had been sharply divided in that 1960 election. Jimmy Hoffa, head of the very powerful and fully mobbed-up Teamsters Union, had become a bitter foe of Robert Kennedy during the latter's 1957 service as Chief Counsel of the Senate "Rackets Committee," and Hoffa therefore became one of Nixon's most important backers, secretly delivering his campaign committee a million dollars in cash and encouraging all the Teamster locals and the affiliated gangster groups he could influence to give the Republican candidate their enthusiastic support.

The actual relationship between crime lords and the new American president was a complex and contradictory one, with brother Robert fiercely prosecuting the mob even as the CIA enlisted the support of the same groups—and sometimes even the same individuals—in their unsuccessful efforts to assassinate Cuba's Communist dictator, Fidel Castro.

Although I was quite surprised when I discovered that all these gossipy rumors were actually based upon solid evidence, even more shocking were the less sanguinary facts that finally came to my attention. Although scrupulously ignored by respectable journalists and historians, there was strong evidence that elements of organized crime had already deeply penetrated the commanding heights of corporate America, and sometimes secured important government decisions on their behalf.

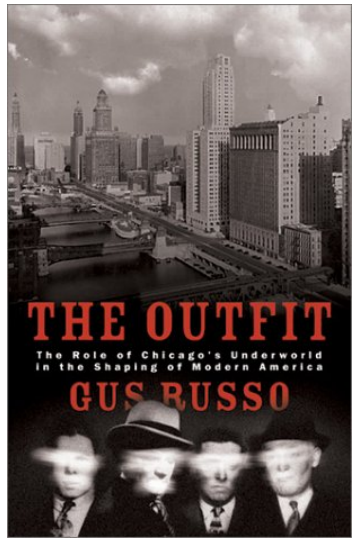
Consider, for example, the General Dynamics corporation, which already ranked as one of America's leading defense contractors by the 1950s, and whose name had always held a vague place in my mind not too different from that of Lockheed or Boeing. Years earlier I had read with considerable shock an offhand paragraph by the late journalist Alexander Cockburn, a fearless muckraker:

> Talking of continuity, a notorious scandal of the Kennedy years was JFK's defense secretary, Robert McNamara, overruling all expert review and procurement recommendations and insisting that General Dynamics rather than Boeing make the disastrous F-111, at that time one of the largest procurement contracts in the

> Pentagon's history…Crown, of Chicago Sand and Gravel, had $300 million of the mob's money in General Dynamics' debentures, and after the disaster of the Convair, General Dynamics needed the F-111 to avoid going belly-up, taking the mob's $300 million with it.

Although I later became quite friendly with Cockburn and respected his opinion, at the time I treated his casual claims with considerable skepticism. However, Hersh's far more detailed coverage fully confirmed that story, and reported some of its even more amazing details. Apparently agents of the aerospace corporation were observed burglarizing the home of JFK's favorite mistress, and Hersh suggested that the incriminating blackmail evidence they presumably obtained was the reason why Defense Secretary Robert McNamara overruled all of his Pentagon brass and awarded the largest military government contract in world history to the Syndicate-backed firm. Moreover, even by government procurement standards, the resulting F-111 was a remarkable disaster, never achieving any of its intended performance goals despite suffering nearly 700% in cost-overruns. So a financial investment of organized crime was salvaged at great cost both to our military effectiveness and to the American taxpayer.

Given that organized crime had apparently played a far greater national role in twentieth century American history than I had realized from my readings of mainstream newspapers and magazines, I recently decided to expand my knowledge in that area. Someone brought to my attention the work of investigative journalist Gus Russo, a prominent author on that topic. Russo had worked as a lead reporter for the award-winning PBS *Frontline* series and filled similar roles at other television networks, while being nominated for a 1998 Pulitzer Prize for his book on the JFK-Mafia alliance against Castro.



Over a dozen years ago, Russo published a pair of massive volumes on the history of organized crime focused on two particular regions, with *The Outfit* in 2001 discussing Chicago and *Supermob* in 2006 dealing with California. Taken together these two works of deep investigative research run more than 1100 pages and over a half million words, apparently dwarfing almost anything else in that subject area. By the 1990s declassification of a vast quantity of government documents, including FBI wiretaps and Congressional files, allowed Russo access to this previously unavailable material. He supplemented this crucial archival research with the secondary source material contained in hundreds of books and articles, as well as more than 200 personal interviews, and his especially extensive second volume references this wealth of source material with more than 1500 footnotes. The numerous laudatory cover-blurbs by prominent prosecutors, former law enforcement agents, and experts on organized crime strongly attest to the credibility of his research, which certainly must have absorbed many years of concentrated effort.

As a newcomer to the subject of the Chicago Syndicate, my first surprise was the remarkable continuity and longevity of that criminal enterprise. I had always vaguely assumed that after Al Capone's imprisonment and the repeal of Prohibition, his gang had largely disintegrated or at least had lost most of its power, but this was entirely incorrect. Instead, over the next few decades, Capone's successors greatly reduced the public violence that had provoked a harsh federal crackdown, but simultaneously multiplied their wealth and power by gaining control of numerous other sources of revenue, many of them legitimate unions and businesses, and also expanded

their geographical reach across various other states. Chicago's gangland leadership also seemed remarkably stable throughout most of the next half-century, so that even as late as the 1970s, the paramount Syndicate authority was exercised by an individual who had originally enlisted with Capone in the 1920s as a violent young hoodlum, soon winning widespread renown for allegedly beating to death two of Big Al's treacherous henchmen with a baseball bat.

Authors have a natural tendency to emphasize the importance of their particular subjects, but I think Russo makes a persuasive case that the unity and stability of the Chicago underworld gave it a considerable advantage over its New York City counterparts, whose permanent division into five separate Mafia families led to an uneasy local peace occasionally punctuated by violent conflict. As a result, the disunited New York gangsters were never able to exercise much control over their local city government let alone the rival criminal power-centers of other East Coast cities, while the Chicago Syndicate seems to have always been a very powerful force in city politics, and successfully extended its suzerainty throughout much of the Midwest, the Rocky Mountain states, and into California.

Another surprise was the ethnic skew of the Chicago Outfit and its closest collaborators. Across the East Coast, full Mafia membership was traditionally restricted to Sicilians or other Italians, but none of those rules seemed to apply in the Windy City. During the 1920s there had been a series of bloody battles between Capone's Italian mob and the violent Irish gangsters who controlled the Northside, with Jews being substantially represented in both groups. But Capone had steadily eliminated his opponents, winning a final, crushing victory with the St. Valentine's Day Massacre of 1929, after which Irish names mostly disappear from the crime narrative, while the presence of Slavs or Germans had always been rare, despite their huge local populations.

But although the top Syndicate leadership remained almost entirely Italian—with a Welsh immigrant being the sole exception—roughly half of all the key figures found in Russo's detailed narrative turned out to be Jewish. From the 1930s onward, organized crime in Chicago was essentially an Italian-Jewish partnership, with the Italians concentrating on the violent muscle side of the business and the Jews more likely to be involved in money-laundering, political corruption, and legal manipulation.

The deep underworld links of individuals whom my mainstream histories had never characterized as "mobbed up" was eye-opening.

For example, I'd always known of Walter Annenberg as the very wealthy publisher of TV Guide and a close friend of the Reagans, endowing the massive Annenberg Foundation to support various non-profit projects, including PBS. However, the family fortune had been established by his father Moe Annenberg, who created America's largest bookie wire service in close alliance with Capone and his Chicago successors. The elder Annenberg eventually served time in federal prison for evading taxes on his enormous illegal income and paid the largest tax fine in American history, while arranging that charges be dropped against his son Walter, who was his partner in the business. Russo actually defends Annenberg, arguing that he was unfairly targeted for prosecution by the Roosevelt Administration because of his political opposition to FDR.

As another example, my history textbooks had frequently mentioned that President Harry Truman had been a product of the Pendergast machine of Kansas City, Missouri, whose activities I'd always assumed were restricted to local politics and perhaps a bit of municipal graft. But according to Russo, the city was second only to Chicago in its municipal corruption, with the local police force run by an ex-Capone mobster and ten percent of the officers having criminal records, while Pendergast himself had been a prominent participant at the 1929 national gangster convention in Atlantic City as well as later mob summits. Truman's handwritten journal records the criminal actions he had regularly allowed in return for his elected judgeship.

According to Russo, Pendergast later decided to elevate Truman to the U.S. Senate mostly to gain protection from the backlash over the recent local murder of four federal agents, and Truman's victorious Senate campaign had involved several additional killings. Over the course of the Truman Administration, Attorney-General Tom Clark was apparently promoted to the Supreme Court in exchange for arranging the early release of a top Capone lieutenant who was then serving time in federal prison, a scandal that led the *Chicago Tribune* to demand Clark's impeachment.

Truman himself had reached the White House because he was placed on the 1944 ticket as FDR's Vice President, and his nomination had been pushed by garment union leader Sidney Hillman, president of the CIO and sometimes described as the second most powerful man in America. According to contemporaneous news accounts backed by declassified government files, the successful rise of Hillman's union had been facilitated by a close alliance with the gangsters of New York's Murder, Inc., whose leader Lepke Buchalter was eventually executed for one of Hillman's hits.

During this era, the huge growth in the power and influence of organized crime had not passed unnoticed by those outside its orbit, and they sometimes chose to focus upon it for their own reasons, but often suffered unexpected setbacks. In 1950 freshman Tennessee Senator Estes Kefauver decided to raise his public profile for a future presidential run by leading a national crusade against gangster power and holding public hearings to vilify their leaders. However, Kefauver was a notorious womanizer and during his preliminary visit to Chicago, compromising photos were taken of him in the arms of two mob-supplied women, after which the Senator changed his mind about requiring testimony from his top Syndicate target.

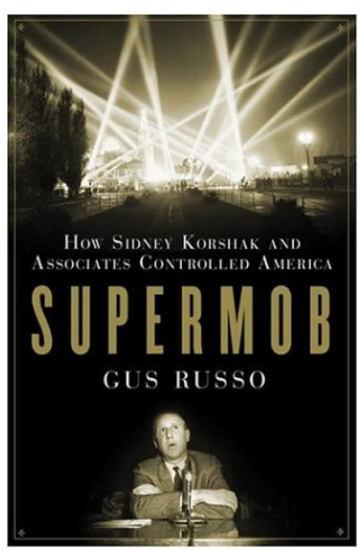
Sometimes real life gangsters impinged upon their Hollywood counterparts in ironic ways. In 1959 Desi Arnaz began producing *The Untouchables*, a popular television show presenting weekly Prohibition Era battles between G-Man Eliot Ness and mobsters Al Capone and Frank Nitti, with the TV drama playing a major role in shaping the public perceptions of organized crime. According to later mob memoirs, the top Chicago gangsters soon became outraged at what they regarded as a highly inaccurate portrayal of their own history and one that they considered slanderous toward Italian-Americans, so after Arnaz ignored the warnings they sent him via Frank Sinatra, they arranged to have him killed. But their California agents dragged their feet about assassinating the world-famous star of *I Love Lucy*, and Capone's widow soon vetoed the hit because her son had been Arnaz's best friend during their days as Florida high school classmates.

This very crude attempt of Chicago's Italian gangsters to protest their perceived ethnic portrayal in a simple television show raises a much broader point, which should be carefully considered. Aside from our personal experiences in real life, nearly everything we know about the world comes from the media, with electronic entertainment being especially dominant for most people. During the 1930s and 1940s gangster movies of varying quality had been quite popular, and to some extent *The Untouchables* helped revive that genre for the newly powerful medium of television. Meanwhile, with the exception of cartoon-focused Disney, all of Hollywood's major studios had almost always been owned or run by Jews, who also controlled all our radio and television networks. So for decades nearly everything ordinary Americans heard or saw arrived through that very specific ethnic filter.

The popular perceptions of the nature of organized crime demonstrated the impact of that situation. Throughout the middle decades of the twentieth century, gangsters were sometimes presented

without any clear ethnic tinge, frequently as Italians or perhaps Irish, but only very rarely identified as Jewish, thus establishing an implicit framework of reality that was considerably misleading.

As I gradually came to recognize this distortion of history a couple of decades ago, I once decided to conduct a simple thought-experiment by mentally listing the dozen most prominent figures that casually came to my mind from the Gangster Era. Al Capone was obviously the most infamous, followed by Lucky Luciano, Meyer Lansky, and Bugsy Siegel. After that came a number of somewhat lesser figures: Frank Costello, Legs Diamond, Lepke Buchalter, Dutch Schultz, Bugsy Moran, Johnny Torrio, Hymie Weiss, and Arnold Rothstein. I had never studied American crime history so my list was vague and impressionistic, but I was surprised to realize that a milieu I'd always regarded as overwhelmingly Italian was actually mostly Jewish, suggesting that I had accepted the misleading headlines of a historical narrative without focusing upon its actual contents. Indeed, Brooklyn's notorious Murder Inc. was originally established by Lansky and Siegel and seems to have been overwhelmingly Jewish, while living up to its name by its many hundreds of killings, with one of its leading members supposedly having a personal body-count of 100 or more victims. But since I'd never heard of a single Jewish gangster in Chicago, I was still very surprised that such individuals comprised nearly half of the leading figures in Russo's comprehensive history.



Russo's 2001 volume may well rank as the definitive history of

Chicago organized crime, and after years of additional research he published *Supermob*, a 2006 sequel focused upon my own state of California, which I found even more interesting and deeply disturbing. While his first book was primarily an account of a city's underworld and its evolution under the heirs of Al Capone, this one told the story of how individuals who had gotten their start among those Syndicate gangsters went on to achieve far greater wealth and power in the "upperworld" of business respectability. And the ethnic dimensions of organized crime, which had been an important subtext of that first work became absolutely central to this second one.

His sweeping narrative explains that during the years immediately following World War II, a group of interconnected individuals who were alumni of the Chicago Syndicate relocated to California and largely took over the politics of the Golden State, even while the local and national media averted their eyes from these important developments, rendering them invisible to the general public. He makes a strong case for the reality of these extraordinary claims.

An important point emphasized by the author is that this transformation was facilitated by the political reforms of former governor Hiram Johnson and other leading California progressives in the early decades of the twentieth century. Seeking to prevent the rise of the political "bossism" endemic to many Eastern states, they had drastically curtailed the power of political parties by allowing candidate cross-registration and other measures intended to greatly reduce the influence of the party infrastructure. But the state's population then skyrocketed by over 50% between 1940 and 1950 and by nearly another 50% in the decade that followed, largely due to new arrivals from elsewhere in the country. With parties having little power and most candidates being unknown to this vast influx of new California voters, advertising money became the crucial ingredient of political success in such a huge state with expensive media markets, so those able to raise the necessary funding might rise very rapidly in political circles. Furthermore, individuals who had been trained in the ruthless political jungle of Chicago found naive California a far easier environment in which to operate.

Art White, a leading Los Angeles political reporter of that era, later explained these unusual political circumstances:

> California was to become a state full of strangers, political waifs and mavericks who registered in their party of preference only to find that they had come to a place where political ideology was of no importance. Republicans ran as Democrats and Democrats ran

> as Republicans. With disconcerting regularity, Republicans, having won both party nominations, were elected in the primaries.
>
> Since party designations had no meaning to the electorate, elections were won by the candidate with the most money, the greatest number of billboards, direct mail pieces, and the most radio time.
>
> Any individual who could devise a system to furnish these campaign necessities on a sustained basis was on his way to becoming a political boss, California style. The boss…could have a say, perhaps the final word, in the appointment of judges from the municipal courts to the state supreme court. Other appointive jobs included inheritance tax appraisers, deputy attorney generals, state department heads and commissioners of departments. With a handful of such appointments in his pocket, the boss could protect his economic interests.

One of the most striking examples of such rapid success was the career of former Chicago attorney Paul Ziffren, whose meteoric rise in the backroom world of California politics was fueled by his ability to raise enormous sums of money for his favored candidates. Soon after arriving in Los Angeles during the mid-1940s, his strong relationship with the Truman White House allowed him to quickly supplant the leading local Democrats in national influence. By 1953 he had been named the Democratic National Committeeman for California, and was hailed for "reinvigorating" the state party, which had successfully captured both houses of the state legislature for the first time in 75 years. He won the fulsome praise of the party's National Chairman, who described him as the most important individual Democrat behind that success.

Ziffren's lifelong mob associations pervade some one hundred pages of Russo's book, but in 1954 he successfully elected Pat Brown as California's Attorney-General, who then repaid that crucial backing by naming Ziffren's brother as the Assistant Attorney-General for Southern California, thereby providing the Syndicate's ongoing activities with a great deal of legal protection despite the continuing hostility of local law enforcement departments.

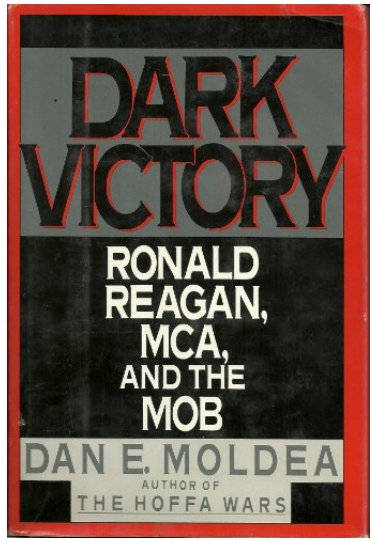
This new kingmaker of California Democratic politics saw his legal risks further diminish the following year when Alex Greenberg, his longtime business partner, was shot to death gangland style on the streets of Chicago, taking to the grave his personal knowledge of

Ziffren's enormous web of Syndicate-related real estate transactions. Ziffren's power and influence lasted for decades, and when he finally died in 1991 at the age of seventy-seven, his mourners included former California governors Pat and Jerry Brown, future governor Gray Davis, and numerous top Hollywood stars, while he received uniformly glowing tributes in the *Los Angeles Times* and other newspapers, none of which provided a hint of his nefarious personal background.

The California Republican Party frequently pursued similar financial temptations. While Ziffren was successfully raising funds from mysterious sources for the 1950 U.S. Senate campaign of Helen Gahagun Douglas, longtime mob lawyer Murray Chotiner was performing the same task for her successful foe Richard Nixon, whose victory established Chotiner as a leading Republican strategist, both in California and nationwide. Ironically enough, while candidates regularly denounced the underworld ties of their opponents, all these rival Democratic and Republican "Supermob" lawyers had nearby homes and offices in Beverly Hills and generally remained good friends with each other and even occasional business partners, perhaps exchanging casual gossip about the strengths and weaknesses of the various candidates whose campaigns they regularly ran, much like jockeys might do about their different racetrack mounts.

Pat Brown reached the governorship in an upset against Chotiner's Republican candidate in 1958, and then won reelection against Nixon in 1962, but lost in 1966 to newcomer Ronald Reagan. Reagan's own political rise had been orchestrated by Hollywood mogul Lew Wasserman of MCA, yet another Chicago transplant. Wasserman together with his mentor Jules Stein also had decades of mob-ties stretching back to Al Capone himself, having regularly employed gangster muscle to strong-arm their business partners and suppress their competitors.

Russo provides the remarkable account of how Wasserman had propelled Reagan, then a washed-up B movie actor, into the presidency of the Screen Actors Guild in 1959 in order to obtain a special industry exemption for MCA, afterward rewarding the future president with an extremely lucrative TV contract. As a result of this successful regulatory maneuver, MCA's unique business opportunities established Wasserman as the reigning king of Hollywood for decades and he subsequently played a major role in elevating Reagan to the governorship.



Russo's own factual account of these events draws upon *Dark Victory: Ronald Reagan, MCA, and the Mob*, a heavily-researched 1986 volume by veteran crime journalist Dan Moldea, which I had previously read and found quite persuasive. The enormous clout of MCA and its executives seem to have severely reduced distribution and media coverage of Moldea's book, while the author was forced to resign from The Institute of Policy Studies, a leftwing DC thinktank dependent upon financing from MCA-connected donors. A very similar fate had previously befallen popular author Henry Denker's 1972 novel *The Kingmaker*, a *roman a clef* portraying Wasserman and the political rise of Reagan, which also saw its distribution widely suppressed despite its excellent reviews.

Although Wasserman achieved great wealth and enormous social prominence, he never cast aside his long criminal associations, and for decades his closest personal friend was the Syndicate's California liaison.

That individual was attorney Sidney Korshak, who constitutes the central figure in Russo's long narrative, with one of his rare public photographs gracing the cover. Korshak had gotten his start working for the Capone gang in Chicago, and he soon gained a reputation for his deft ability to bridge the worlds of criminal gangs, racketeer-influenced unions, and legitimate businesses. This effectiveness and his near-total lack of a paper trail in public records or the media established him as the ideal representative of the Chicago Syndicate, and according to later Congressional testimony, they moved him out

to Southern California in the early 1950s to oversee their rapidly-expanding West Coast operations.

In the years that followed, Korshak became one of the leading powerbrokers in Hollywood, while also having enormous influence over the unions of the Western states and the businesses dependent upon them, sometimes having the ability to start or stop strikes with merely a phone call. Although nominally still a lawyer, he had no office nor staff, and conducted most of his business activities from a private phone he had installed at his favorite table of a leading Beverly Hills bistro, sometimes walking outside for his more delicate conversationss in order to avoid eavesdropping. All references to his overlords back in Chicago were given in code, so that upon returning from their honeymoon, Korshak's new wife noted the long list of opaque messages that had been left by George Washington, Thomas Jefferson, Abraham Lincoln, and Theodore Roosevelt. FBI wiretaps revealed that the Syndicate bosses warned California gangsters never to contact Korshak directly, but instead to always use his Chicago superiors as the conduit for all requests and communications.

Throughout his long career Korshak went to enormous lengths to maintain his near-total public invisibility, and although he regularly attended Hollywood events and elite dinner-parties, there was a horrified stir when an uninformed screenwriter once accidentally snapped his photograph. Despite a growing awareness of his enormous power in Southern California and his very unsavory connections, he successfully deployed his connections and influence to ward off almost all newspaper coverage. In 1962 the top management of the *Los Angeles Times* suddenly dismantled that newspaper's star investigative unit in order to terminate a long series they had begun running on the Teamsters Union funding for suspicious real estate transactions, which would have inevitably led to Korshak and his inner circle of Syndicate associates. As the *Times'* managing editor later described the situation: "Once you get to the point where you can get a guy to talk, then either you or he or both are going to end up in a lime pit somewhere."

By 1969 widespread local awareness of Korshak's enormous hidden power and deep gangland ties finally prompted the national editor of the *Times* to commission his profile by a young reporter. Despite a great deal of lobbying pressure, this story finally ran, though in sufficiently tame form that Korshak later boasted that all this friends regarded it as a personal advertisement. Still, to avoid any such future coverage, he soon offered Buff Chandler, the newspaper's matriarch, an immediate donation of $25,000 to ensure that his name would

never again appear in print, an agreement she accepted and honored. Over the years, several determined journalists across California would find their heavily-researched stories killed by their editorial superiors, sometimes causing them to quit their newspapers in disgust.

During Korshak's decades of power, one of the extremely rare major profiles of his activities appeared in *The New York Times*, written in 1976 by fellow-Chicagoan Seymour Hersh, who had already gained renown for breaking the My Lai massacre story a few years earlier, a triumph that earned him a Pulitzer Prize and numerous other accolades. As Hersh later explained, when he began his research, outraged police officials and previously muzzled journalists quickly provided him with troves of background material. But he also soon discovered that Korshak had obtained all his calling records and travel itinerary from a *Times* employee, and he later had a chilling phone conversation with the subject of his probe from a pay phone in West LA. Although Korshak was careful to never explicitly threaten him, his dialogue was very heavily laced with words like "murder… bodies…blood…death…killings," and Hersh still vividly recalled that conversation decades later. He later learned from others that Korshak regularly employed that style of intimidation in such situations.

Although powerful lobbying by Korshak's allies and threats of lawsuits led two top *Times* executives to try to stop the investigation, and the Teamsters eventually struck the newspaper on the very eve of the series' scheduled appearance, Hersh's stories ran, and they provoked a great deal of national attention, although they were studiously ignored by the *Los Angeles Times.* Afterward, Hersh was contacted by one of Korshak's nieces, who provided a personal anecdote that included a casual mention of how in his younger days at a family Passover seder Korshak had expressed satisfaction after receiving a phone call reporting the successful assassination of an Illinois political reformer. In a rare personal interview with Russo, Hersh tersely summarized his appraisal of Korshak: "He was the godfather. There's no question, he ordered people hit."

Aspects of Korshak's lifestyle certainly comported with such notions. His walled and gated home was patrolled by armed guards, reportedly former members of the Israeli military. A studio executive who visited him found the front door answered by a man with a gun, a situation that he had never previously encountered.

Such considerations of personal security may not have been unwarranted. According to FBI documents later released, Korshak had hardly been monogamous in his loyalties, and he had sought to

maintain his legal immunity by providing a steady stream of confidential information to Las Vegas law enforcement and the Bureau, facts that surely would have put his life at serious risk if they had been discovered by his underworld confederates. Indeed, when Korshak was in his eighties, he was once suddenly approached by a Hollywood reporter on the street, and reacted as if he assumed that his number had finally come up, then was greatly relieved to discover that the fellow was just a journalist rather than the hitman whose arrival he had long anticipated.

Korshak's massive impact is described in enormous detail across the pages of Russo's thick volume. He played crucial roles in electing California governors, made Al Pacino available as the star of *The Godfather*, apparently helped ensure that Roman Polanski escaped punishment for raping and sodomizing a thirteen-year-old girl, and was involved in a vast number of legal and illegal business transactions whose dollar values seemingly total in the billions. But with his name almost never appearing in the media, the general public was surely unaware of his existence when he died of natural causes in 1996. At that point, the news media suddenly regained its courage, and his passing was announced in headlines that must have somewhat puzzled their previously ill-informed readers, with *The New York Times* running "Sidney Korshak, 88, Dies; Fabled Fixer for the Chicago Mob" and *The Los Angeles Times* "Sidney Korshak, Alleged Mafia Liaison to Hollywood, Dies at 88."

Money was undoubtedly the mother's milk of postwar California politics. But the speed with which these recent Chicago arrivals transformed themselves into powerful financial figures in their new state was greatly assisted by their participation in a particularly lucrative windfall. They were leading beneficiaries of one of the worst governmental violations of constitutional rights in our national history, and Russo devotes an entire chapter to this dark tale.

Like all other Asians, California's ethnic Japanese population had long suffered under the harshest sort of racial discrimination, being denied naturalized citizenship and therefore prohibited from owning land, while nearly all additional immigration from their homeland had been banned in the 1920s. Yet although they had arrived as penniless farm laborers mostly around the turn of the century, their intense work-ethnic and diligent savings had established them as a small but reasonably prosperous community by the late 1930s. The Fourteenth Amendment granted citizenship to their American-born children, thus

allowing their families to eventually acquire large amounts of farmland and other properties, with their visible success sometimes provoking considerable envy from their white neighbors and competitors.

As I have discussed elsewhere, FDR's desperate attempt to circumvent overwhelming public opposition to America's involvement in World War II eventually led to his endless 1941 provocations against Japan, which successfully culminated in the attack on Pearl Harbor. Soon afterward, demagogic appeals by politicians and media pundits led much of the public to begin demanding the incarceration of all ethnic Japanese, U.S. citizens or not, and by early 1942 FDR signed an executive order shipping some 120,000 Japanese-Americans off to grim concentration camps, with those individuals sometimes being forced to leave their homes on very short notice. As a result, they lost nearly all the property they had steadily accumulated over two generations, most of which was either seized or otherwise ended up in government hands. Similar government edicts led to the confiscation of numerous German-owned businesses throughout America, many of which possessed enormously valuable assets.

Within a couple of years, these federal holdings had swelled to include half a million acres of the state's best farmland, some 1,265 small Japanese-owned hotels, and numerous urban parcels throughout Los Angeles, San Jose, and other cities. In 1942 the federal government estimated the value of these former Japanese-American properties at around $3 billion in present day dollars, but the huge postwar California economic and population boom would surely have greatly increased the worth of this real estate portfolio by the early 1950s. The business assets and patent holdings of the seized German companies were worth additional billions.

Following the end of the war, all this property needed to be sold off, and powerful Chicago interests recognized this tremendous opportunity. The 1946 elections had produced a crushing national defeat for the ruling Democrats, with the Republicans regaining control of both houses of Congress for the first time since 1932. President Truman thus faced a desperate battle for reelection, and Chicago's powerful political machine deployed its considerable political clout to place the sales process in the hands of David L. Bazelon, a young Chicago lawyer and leading Democratic fund-raiser with deep Syndicate ties. Bazelon had taken a pay cut of 80% to enter government service, but he soon boasted to the *Washington Post* that he had become "one of the largest businessmen in the country." His motive quickly became apparent as he arranged the sale of assets for a

fraction of their real value to his circle of Chicago friends and associates, sometimes apparently receiving a secret slice of the lucrative ownership stakes in return.

As an extreme example, Bazelon almost immediately sold Chicago's Henry Crown a twenty-six thousand acre California mine site, containing tens of millions of dollars worth of coal, for a mere $150,000. A private $1 million sale of seized German property in 1948 to a group formed by his lifelong best friend and former law partner Paul Ziffren was worth $40 million by 1954, and Ziffren soon rewarded Bazelon with a 9.2% share of his multimillion-dollar real estate holding company. Another major beneficiary of Bazelon's unusual sales practices later told a Congressional investigating committee that he gave Bazelon a 25% share of his large hotel holding company because he "was just feeling good and generous and was grateful."

These particular hidden gifts to Bazelon only later came to light through chance references that were eventually uncovered by diligent researchers, so we may assume that such transactions probably represented just the tip of an enormous iceberg. It seems plausible that Bazelon received quiet kickbacks totaling many millions or perhaps even tens of millions in present-day dollars in exchange for his very favorable distribution of billions in government assets to the network of beneficiaries who shared his roots in the Chicago Syndicate.

This vast transfer of wealth in the early postwar years from the plundered *Nisei* gave all these mobbed-up Chicago newcomers the financial wherewithal to soon gain substantial control of California's money-based political system. As Art White, the veteran Los Angeles political journalist, later described the situation:

> During these years some hundreds of associates of Greenberg, Evans, and others of the Capone crime syndicate, and of Arvey and Ziffren, poured hundreds of millions of dollars into California. They bought real estate, including hotel chains through apparently unrelated corporations from San Diego to Sacramento. They invested in vast tracts of land, built or bought motels, giant office buildings, and other commercial properties. More importantly, they invaded the loan field, establishing banks and home loan institutions. By 1953, Ziffren and his associates had gained control of an enormous block of California's economy. They could finance political campaigns with the best of the native barons.

Russo notes that the FBI analysts subsequently endorsed White's conclusions:

> When the FBI reviewed White's research into the extent of the relationship between the Capones and Ziffren, it concluded with a rare declaration vindicating White's conclusions: "The extraordinary success of the adventurer [Ziffren]—and by the same token his backers, who can be traced right into the Midwest and East Coast hoodlum world—*has been proven and documented.* (Author's italics).

Russo's Appendix A provides a long but partial list of the major properties acquired by Chicago's Supermob associates.

The dispossession of California's Japanese-Americans certainly constituted a central factor in the enormous growth of Syndicate-connected wealth and power in that state, and Russo describes it as "an inadvertent boost for the fortunes of the Supermob." He may be entirely correct, but other possibilities come to mind.

During World War II, California was located many thousands of miles from the Pacific theater of operations, while Hawaii was obviously far closer and also served as America's most vital military base; yet the larger population of Japanese-Americans living on those islands escaped any such mass incarceration. America's top Republican leader, Sen. Robert Taft, was absolutely opposed to the wholesale imprisonment of the Japanese-Americans, as was FBI Director J. Edgar Hoover, hardly a man noted for his deep civil libertarian tendencies.

Meanwhile, the earliest and most prominent advocate of the internment policy was California Attorney-General Earl Warren, who used the political issue with great effectiveness to unseat the state's incumbent Democratic governor in the 1942 election. And we should note that Warren's successful gubernatorial campaign was masterminded by Chotiner, a Beverly Hills attorney with strong underworld connections, who later became a good friend and sometime business partner of Korshak and the other members of the local Chicago Syndicate network.

Perhaps Warren and his backers merely believed that demonizing a small and powerless racial minority and demanding that they be placed behind barbed wire would represent an excellent path to statewide political victory in the aftermath of Pearl Harbor. But they

may also have considered that the concurrent seizure of billions in accumulated property might provide lucrative later opportunities for unscrupulous individuals, opportunities that were indeed fully realized just a few years later.

Bazelon's secret financial payoffs were not the only reward he received for his generous distribution of billions in government-controlled property to his circle of fellow Capone Syndicate alumni. According to the files of a Congressional committee, Bazelon in 1946 had supposedly told a confidant that he was very worried about an IRS investigation into the work he had earlier done for a large Syndicate-controlled brewing company, and that he "needed a federal judgeship to get him cleaned up." So after Truman's reelection, Bazelon, despite completely lacking any judicial or scholarly experience, was named to the Washington D.C. Court of Appeals, the most prestigious appellate circuit, becoming at age forty the youngest such federal judge in U.S. history. This elevation came through the maneuver of a recess appointment, thereby preventing any initial Congressional review of the disturbing rumors already circulating about the practices he had followed in his distribution of billions in seized government assets.

Former FDR cabinet secretary Harold Ickes, a principled and progressive New Dealer, reacted with total outrage, denouncing the Bazelon appointment as "deplorable" and an "all-time low" in the pages of *The New Republic*, and calling for a Senate investigation into his distribution of seized property. As a former Chicago newsman, Ickes had been a longtime opponent of the Capone Syndicate and its corruption, and he personally wrote Truman in an unsuccessful last-ditch attempt to sink the nomination: "I happen to know a good deal about Bazelon and I consider him to be thoroughly unfit for the job he holds, to say nothing of a United States judgeship, either on the Court of Appeals or on the District Court."

Until reading these books by Russo, I had never heard of Korshak, nor the vast majority of the other leading figures who seemed to have played such important roles in the criminal conquest of California, such as Ziffren, Greenberg, Fred Evans, Al Hart, and Jake Factor. But Bazelon was a name well known to me from the nearly two decades he later spent as the Chief Judge of America's most important appellate court, where he probably established himself as the most influential jurist not found on the Supreme Court. Indeed, Supreme Court Justice William J. Brennan, Jr. later described him as "one of the most important judicial figures of the century."

In all the newspaper and magazine articles discussing Bazelon's long career, he was uniformly portrayed in extremely favorable terms by liberal or mainstream journalists, often characterized as one of our greatest civil libertarians for his passionate championship of the abused and the downtrodden. Meanwhile, conservatives often criticized him as a "bleeding-heart liberal" whose judicial activism overly favored the rights of criminals and the mentally ill.

But based upon the true history of his early decades, neither of these characterizations seems entirely plausible to me, and during all those years and contentious disputes, there never even once appeared a hint of his horrific past record of massive personal corruption and outright criminality in support of his fellow alumni of the Capone Syndicate. Perhaps none of those journalists nor their editors were aware of the facts or perhaps they did not dare raise such a dangerous topic in public. When he died in 1993 at the age of 83, his hugely glowing obituaries in *The New York Times* and *The Washington Post* gave no hint of his sordid past, and despite the massive documentation provided in Russo's thick 2006 volume, his extensive personal Wikipedia page still remains pristine pure of any such taint.

As Russo notes with considerable outrage, the histories of nearly all of Bazelon's fellow Supermob criminal confederates who gained political control of California have similarly been whitewashed and forgotten, with almost none of their sordid path to wealth and power ever appearing in the media, and their glowing obituaries instead hailing them as among America's greatest civil libertarians and most generous philanthropists. In an interview with Russo, Connie Carlson, the former chief white-collar crime investigator for California's Attorney-General, acidly noted: "Isn't it interesting how all these 'civil libertarians' ended up with the confiscated Japanese land?"

So we see that a small network of organized crime alumni from Chicago seized great political power in California before I was even born and utilized it to protect their corrupt financial schemes. Indeed, in 1978 the head of the Chicago Syndicate reportedly reacted to the encroachments of New York Mafia boss Joe Bonnano by telling one of his enforcers: "Watch that fucking Bonanno…he wants what's ours—what's always been ours, California. He can't have Arizona, and he sure has hell can't have California." But as I grew up in the world substantially controlled by such individuals, I never once noticed nor suspected a thing.

The explanation of this paradox is obvious. The petty racketeers and municipal chiselers whose corrupt endeavors were generally run on a small scale either mostly stayed behind in the Windy City or never permanently established themselves among the sprawling and prosperous middle class suburbs that sprang up all across postwar California. And the notable absence of such highly-visible local corruption and organized crime manifestations in our ordinary daily lives led most of us to assume that such activities were almost entirely absent in our state. We never suspected that a small group of similar criminals were situated in the upper strata of our society, but with far greater financial goals and protected by a cowed or compromised local media. Presumably the large-scale mobsters were pleased that the absence of their small-fry counterparts helped them to maintain their invisibility.

Several years ago, I published an article that included mention of this important distinction between micro-corruption and macro-corruption:

> However, although American micro-corruption is rare, we seem to suffer from appalling levels of macro-corruption, situations in which our various ruling elites squander or misappropriate tens or even hundreds of billions of dollars of our national wealth, sometimes doing so just barely on one side of technical legality and sometimes on the other.
>
> Sweden is among the cleanest societies in Europe, while Sicily is perhaps the most corrupt. But suppose a large clan of ruthless Sicilian Mafiosi moved to Sweden and somehow managed to gain control of its government. On a day-to-day basis, little would change, with Swedish traffic policemen and building inspectors performing their duties with the same sort of incorruptible efficiency as before, and I suspect that Sweden's Transparency International rankings would scarcely decline. But meanwhile, a large fraction of Sweden's accumulated national wealth might gradually be stolen and transferred to secret Cayman Islands bank accounts, or invested in Latin American drug cartels, and eventually the entire plundered economy would collapse.

Although many of the younger and hungrier individuals who had begun their careers in association with the Chicago Syndicate relocated to California, most of their richer and better-established counterparts remained behind in Chicago, though they seemed to have greatly shared in Bazelon's bounty. These families are now numbered among America's wealthiest, and strong evidence of macro-corruption

seems to pervade their activities across the generations.

As mentioned, one of the first suggestions I encountered regarding the important business ties between the underworld and big business was Cockburn's casual mention of Henry Crown's large mob-financed stake in General Dynamics, and the subsequent Pentagon bail-out he arranged. The financial rise of the Chicago-based Crown family figures prominently in Russo's narrative, far beyond their 1947 acquisition of a huge California property from Bazelon for less than 1% of the value of the coal it contained. Crown had launched his supply business in 1919, regularly securing lucrative government contracts in Chicago's graft-ridden business environment, then later enlisting in the military during World War II as a procurement officer. During his service, he was responsible for some $1 billion in military purchases, with his company being sued by the government for price-gouging just a month before his 1945 discharge. Russo recounts some of the transactions by which the Crowns greatly increased their wealth in the postwar period, including their use of the financial backing of the Teamsters to merge their company with General Dynamics, thereby obtaining a substantial ownership share. The Crowns today are worth nearly $9 billion, with roughly half of their fortune due to their remaining 10% stake in that huge military contractor.

Russo also describes how the even richer Pritzkers of Chicago arranged for Jay A. Pritzker, the family scion, to serve as Bazelon's assistant in the disposition of seized assets, with that wealthy young man's DC hotel bill dwarfing his meager government salary during the year he was employed there. Congressional investigators later discovered that he had purchased a seized manufacturing company for just 7% of its value, but given the huge gift of stock that his father later bestowed upon Bazelon, numerous other such transactions may have remained hidden. Many dozens of the pages of Russo's book document the underworld associations of several generations of Pritzkers, which began not long after the founding father opened his Chicago law firm in 1902. The enormously diversified current assets of the Pritzker family are listed in Russo's Appendix B, which occupies nearly six full pages, and the Pritzkers today remain one of the wealthiest families in our country, with total assets of nearly $30 billion, and an enormous record of involvement in recent politics.

Russo came of age during the Watergate era of investigatory journalism and one of his reviewers suggests that his ideological leanings are those of the New Left, a plausible claim given his

occasional scathing references to big business, Ronald Reagan, and American foreign policy. Since most of the Supermob members who seized political power in California were Democrats aligned with the liberal wing of that party, Russo often seems uncomfortable in reporting that their conservative Republican opponents sometimes unsuccessfully levied charges of underworld ties against them, but he grudgingly concedes that such accusations were substantially correct.

Bazelon was a major figure in Russo's narrative, and given the author's ideological leanings, he includes a paragraph or two on the former's long subsequent appellate career, noting with apparent approval his ground-breaking liberal rulings on behalf of the rights of the accused and of the mentally-ill. But although the author notes the obvious hypocrisy this involved, he never attempts to directly explore what seems like a very strange juxtaposition of naked criminal self-interest together with extreme social altruism, all bound together in a single individual.

A casual cynic might humorously suggest that Bazelon's tireless efforts to expand the rights of criminals were aimed at protecting himself and his circle of Syndicate friends, but this seems implausible. The sort of corrupt and highly-sophisticated financial dealings in which they specialized were heavily mediated by experienced lawyers and hardly gained much from the expanded protections afforded to simple street-robbers or to the criminally-insane. On the other hand, an idealist might speculate that Bazelon experienced enormous remorse over the vast fortunes that he and his associates had corruptly obtained through the broken lives of 120,000 innocent Japanese-Americans, and his legal rulings were attempts to expiate this guilt. I am skeptical of this analysis.

Another rather cynical possibility would be that his long national leadership role on human rights and civil liberties was intended to win the plaudits of liberal intellectuals and the media, thereby preempting any later attempt to resurrect the damning evidence provided by the five year FBI investigation of his corrupt sales practices, whose final report ran some 560 pages; and this may be the most plausible explanation. With so much of the modern edifice of liberal jurisprudence based upon Bazelon's rulings, its adherents might be extremely reluctant to allow discussion of the deep criminality of one of its leading architects.

But there is an even more disturbing possibility that comes to mind. Medical personnel and lab technicians usually wear spotless white coats so that even the slightest speck of potentially-dangerous foreign

matter can easily be detected and removed. In a society having very low rates of ordinary street crime or social disorder, public attention would naturally focus upon the sort of business corruption and financial crime that constituted the regular activity of Bazelon and his Supermob circle, who would inevitably become the primary targets of law enforcement efforts. But suppose that same society became overwhelmed with the sorts of robberies, muggings, and rapes that evoke the most public fear, along with the chaos and disorder caused by the frightening public behavior of large numbers of the newly-released mentally-ill. Surely under such conditions, the citizenry would demand that the authorities concentrate their main efforts on those most immediate threats to public safety, necessarily drawing them away from the white collar crimes being committed in lawyers' offices.

I do not think that this analysis is nearly as implausible as it might seem upon first consideration. Over the last few decades, the bulk of the American population has become totally impoverished, with published reports by the Federal Reserve and other organizations indicating that 60% of the population have less than $1,000 in available savings, with 40% lacking even $400. Only a generation or so ago, perfectly good college educations were so inexpensive that many students could cover most of their costs through a part-time job, yet today accumulated student loan debt is over $1.5 trillion dollars, and with any bankruptcy discharge legally prohibited, this gigantic looming burden has created an entire young generation of permanent debt-slaves, who find it financially impossible to get married or purchase their first home. American health care is the most expensive and least efficient in the developed world, and these costs impose a huge parasitic burden upon the rest of our economy, as well as raising the serious risk that a little bad luck might permanently damage the finances of an ordinary family. But while most ordinary Americans have become much poorer, a tiny financial elite has increased its own wealth beyond all comprehension.

During the 1950s and early 1960s, American candidates and campaigns regularly focused upon economic issues, and this sort of extreme economic divergence would certainly have been at the center of most political campaigns. But these days, our politics has instead become dominated by highly-divisive social issues of much less practical significance, with the latest example being the astonishing focus on "transgender rights," which impacts only the tiniest sliver of the population and would have been universally ridiculed as pure political satire just a few years ago. Is it so far-fetched to suggest that these issues have been deliberately promoted as popular distractions,

lightning rods to divert attention from the simple reality that while most people have grown much poorer, our ruling elites have vastly multiplied their wealth?

And the personal background of these elites often is remarkably similar to that of Bazelon and his corrupt network of confederates. A ruling elite whose greed, incompetence, and parasitism has greatly damaged the interests of the general public is obviously quite vulnerable, especially if so many of its members derive from a small, distinct minority. But if they succeed in splitting the public into a whole range of mutually-hostile fractions, divided along ideological and ethnic lines, this vulnerability is considerably reduced.

Although versions of this highly-cynical but generally successful political strategy may well have been in operation for the last few decades, I doubt whether more than a tiny fraction of those involved are consciously aware of it. After all, most people—and even most elites—tend to believe whatever they hear and read in their personal selection of trusted media sources. According to biologists, nearly all the individual members of a given school of fish automatically cluster towards each other by instinct, so that if just one or two individuals happen to move in a particular willful direction, all the others will soon follow their lead.

For example, I would not be entirely surprised if Bazelon and a few of his close associates consciously began efforts to disrupt the orderliness of American society so that they would be free to pursue their corrupt or criminal activities undisturbed, much like rodents would prefer a litter-filled and decrepit house in which to build their hidden nests. But it seems quite plausible that most of their liberal epigones have subsequently followed those same ideas while remaining completely ignorant of the very cynical motives that may have originally inspired them.

Consider Bazelon's grand-daughters Emily and Lara, a journalist and an academic respectively, whose bylines I have regularly noticed over the years in the pages of *The New York Times* and various other elite publications, generally promoting all sorts of mainstream-liberal causes and policies. Given that they were raised under very different circumstances, I tend to doubt that either of them has anything like the long record of criminality which the elder Bazelon had accumulated as he clawed his way to the top of our society. Indeed, I wouldn't be surprised if they remain as completely unaware of his dark history as I had been until quite recently. Perhaps they had simply read all the same media stories on their illustrious grandfather

that I did, and regarded him as a towering pillar of liberal moral rectitude, whose principled ideals they deeply committed themselves to follow. So as a consequence, it is quite possible that some of the policies they zealously advocate may have been explicitly designed to be destructive to our society, but they remain totally ignorant of that crucial fact.

Discussions of ethnicity are extremely sensitive in contemporary American society, especially when they might reflect unfavorably upon Jews. For many decades, our educational and media systems have deeply conditioned us to avert our gaze from such matters, even when they are clearly visible; but some patterns become so overwhelmingly apparent that they cannot be avoided.

Throughout my lengthy discussion of the corrupt looting of the seized Japanese-American property by men with strong Syndicate ties, who subsequently achieved the political conquest of California, virtually every participant whom I mentioned came from a Jewish background, even including those bearing the most Anglo-Saxon of names.

And this remarkable skew merely reflects the actual contents of Russo's very deeply researched 300,000 word study. Although some of the heroic figures who did their utmost to expose and frustrate the growing power of organized crime were Jewish, notably journalists Seymour Hersh and *Colliers*' Lester Velie, that same ethnic background was found in nearly all of the dozens of Supermob members whose overwhelming success across the second half of the twentieth century becomes depressingly evident throughout the sweep of Russo's narrative arc. When examining the leading beneficiaries of the expropriated Japanese or the Syndicate alumni who seized control of California politics, it takes considerable effort to locate a single Gentile.

While I had been very surprised to discover from Russo's first book that nearly half of the prominent organized crime figures in Chicago were Jewish, I was absolutely astonished to discover from his sequel that nearly all their former colleagues who had moved on to acquire vastly greater wealth and political power in California fell into that same category. And whereas all the Chicago gangsters were always notorious as gangsters, most of their far more successful California counterparts had their backgrounds carefully airbrushed by the media, instead being portrayed as highly successful businessmen, political leaders, or philanthropists.

To his enormous credit, Russo does not flinch from this reality, candidly presenting the origins and backgrounds of the key figures he discusses, and indeed the definition of the "Supermob" which he places at the top of his preface highlights the "Russian Jewish heritage" of the "group of men from the Midwest…who made fortunes in the 20th century American West in collusion with notorious members of organized crime." He follows this by summarizing the central thesis of his fascinating text:

> Two types of power dominated the twentieth century: the visible, embodied in politicians, corporate moguls, crime bosses, and law enforcement; and the invisible, concentrated in the hands of a few power brokers generally of Eastern European and Jewish immigrant heritage. Operating safely in the shadows, these men often pulled the strings of the visible power brokers. Although they remained nameless to the public, they were notorious among a smattering of enterprising investigators who, over decades, followed their brilliant, amoral, and frequently criminal careers. The late Senate investigator and author Walter Sheridan dubbed them the Supermob.

Although I had merely glanced over this short passage at the beginning of his very long book, I returned to it afterward, and found it an extremely accurate summary of his massively-researched study.

Russo may or may not be aware of it, but for most of the last couple of centuries, Eastern European Jews have enjoyed a tremendous reputation for rampant criminality, especially involving crimes of corruption, vice, or financial gain. Since the end of World War II, overwhelming Jewish influence in the media and academic worlds has led to massive suppression of this historical reality, much like the criminal activities of the Supermob disappeared almost without a trace prior to Russo's ground-breaking research. But his story would hardly have surprised knowledgeable Americans a century or more ago. Before Jewish political and media had fully established itself, writers sometimes candidly discussed such criminal tendencies in ways that might seem extremely discordant to naive present-day Americans.

In 1908 former general Theodore Bingham was serving as Police Commissioner of New York City, and near the end of that year he published a long article on his city's foreign criminals in *The North American Review*, then one of our leading intellectual magazines. His

discussion seemed quite careful and even-handed, but he noted that Jews had three times the crime rate of the remaining population of his overwhelmingly immigrant city, a figure considerably higher than that of any other group, even including the Black Hand-plagued Italians. This factual assessment sparked a huge outcry by Jewish organizations, and although he immediately rendered a personal apology, he nevertheless was summarily removed from office a few months later.

In 1913, E.A. Ross, one of our greatest early sociologists, published a fascinating analysis of different immigrant groups. He noted the high incarceration rates of Italians, but emphasized that this was mostly due to acts of personal violence unrelated to criminal activity, the predations of the Mafia notwithstanding, while despite the longstanding Irish reputation for drunken brawling their crime rates had receded to being among the lowest of any group a couple of generations after their immigration peak. By contrast, although he emphasized the high ability of Jews, he could not avoid also mentioning their notorious tendency for swindling and dishonesty, with their predatory crime being the highest of any group, while they sought to avoid punishment by widespread use of perjury. These sorts of candid observations by Ross have apparently prompted many decades of his unfair vilification by subsequent Jewish historians.

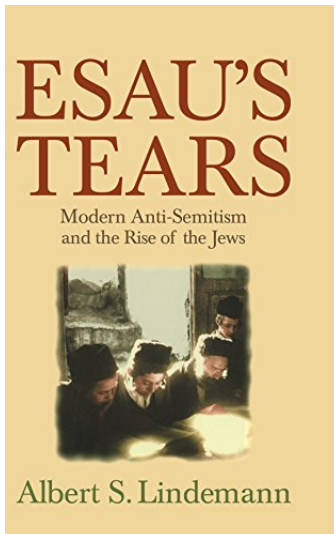
  E.A. Ross • 1914 • 5,000 Words

By the 1920s, Jewish media influence had reached the point at which newspapers and magazines had become very reluctant to report on the misbehavior of that group, which led wealthy industrialist Henry Ford to begin publishing *The Dearborn Independent*, a weekly paper with enormous national circulation, willing to violate those growing taboos. He later collected together the series of articles dealing with Jewish misdeeds, and published them in four volumes as *The International Jew*. Despite its notorious reputation, the collection mostly consists of rather mundane accounts of corruption, criminality, and financial misbehavior that seem little different from what Russo was to document a few decades later.

- The International Jew
  *The World's Foremost Problem*
  Henry Ford • 1920 • 323,000 Words

Prior to the modern decline of belief in religion and other elements of

the supernatural, swearing binding oaths to God constituted an important means of enforcing business contracts and determining guilt in legal proceedings, with present-day courtroom procedures still containing a vestigial element of those notions. So some years ago I was quite shocked to discover from Prof. Israel Shahak that traditionally-observant Jews annually undergo a religious ceremony that declares all their future oaths for the forthcoming year null and void in advance, thereby freeing them from any such restrictions. This religious loophole was obviously an important competitive advantage for those engaging in dishonest economic activity let alone outright criminality.



In 1997 Cambridge University Press published *Esau's Tears* by eminent scholar Albert Lindemann, a 500 page study of 19th century European anti-Semitism. His historical evidence demonstrated a very widespread pattern of Jewish criminality across Europe, with nineteenth century France having been rocked by huge financial scandals engineered by immigrant Jews, which impoverished large numbers of small investors. The situation in Russia was even more serious:

> As Lindemann candidly describes the tension between Russia's very rapidly growing Jewish population and its governing authorities, he cannot avoid mentioning the notorious Jewish reputation for bribery, corruption, and general dishonesty, with numerous figures of all political backgrounds noting that the remarkable Jewish propensity to commit perjury in the courtroom led to severe problems in the effective administration of justice.

Some historical tendencies remain remarkably consistent over time.

All of us have our own areas of special expertise, and naturally tend to accept the conventional narrative on most other matters. Prior to reading Russo's two lengthy works, much of my media-influenced understanding of American organized crime would have been entirely mistaken.

Towards the end of his second volume, Russo notes the tremendous hypocrisy surrounding Bazelon's ring of Jewish beneficiaries, who acquired the properties of the interned Japanese not long after their own German relatives had been similarly victimized by the Nazis. In the past, I would have casually nodded my head at this obvious analogy, but I now think he may be mistaken in his history.

Not long ago, I came across a very interesting book written by Sir Arthur Bryant, an influential historian whose Wikipedia page describes him as the personal favorite of Winston Churchill and two other British prime ministers. He had worked on *Unfinished Victory* during the late 1930s, then somewhat modified it for publication in early 1940, a few months after the outbreak of World War II had considerably altered the political landscape. But not long afterward, the war became much more bitter and there was a harsh crackdown on discordant voices in British society, so Bryant became alarmed over what he had written and attempted to remove all existing copies from circulation. Therefore the only ones available for sale on Amazon are exorbitantly priced, but fortunately the work is also freely available at Archive.org.

Writing before the "official version" of historical events had been rigidly determined, Bryant describes Germany's very difficult domestic situation between the two world wars, its problematic relationship with its tiny Jewish minority, and the circumstances behind the rise of Hitler, providing a very different perspective on these important events than what we usually read in our standard textbooks.

Among other surprising facts, he notes that although Jews were just 1% of the total population, even five years after Hitler had come to power and implemented various anti-Semitic policies, they still apparently owned "something like a third of the real property" in that country, with the great bulk of these vast holdings having been acquired from desperate, starving Germans in the terrible years of the early 1920s. Thus, much of Germany's 99% German population had

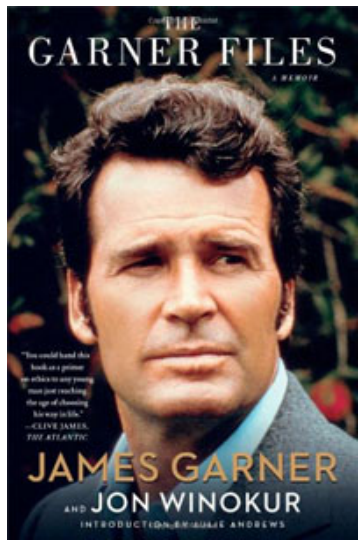
recently been dispossessed of the assets they had built up over generations, sometimes due to the same sort of corrupt financial practices that Bazelon and his friends had used to enrich themselves in California at the expense of the Japanese.

So although Russo is correct in believing that there was a strong correspondence between the distressing events he covers in California and the somewhat earlier developments in Germany, the analogy may not be exactly what he believes it to be.

During the late 1970s my favorite show on television was *The Rockford Files*, in which James Garner played a wise-cracking private-eye in Los Angeles, and I was quite disappointed when the series was cancelled at the end of 1979. A foreign friend of mine in college noted that Garner's very square jaw and bold demeanor made him look remarkably like a young Ronald Reagan, who had been lifted to enormous political heights by his usefulness to Lew Wasserman, whose MCA-Universal also happened to produce Garner's show. But just a couple of years ago I happened to discover the backstory to those events, and how the actor's willingness to stand up for his rights may have led him to a sharply different fate.

Garner had agreed to relatively low personal fees for each *Rockford* episode in exchange for a substantial share of the overall profits, which seemed likely to be enormous once it went into syndication. But near the end of the fifth season, he accidentally discovered that under studio accounting the extremely popular show had accrued cumulative total losses of $9.5 million, and was unlikely to ever turn much of a profit. Garner had suffered a great deal of damage during his very physically-demanding series, doing nearly all of his own stunt-work and typically involved in two fist-fights or beatings in each episode. Soon afterward, he stopped coming to the set based on his doctor's recommendation that he seek immediate treatment for a bleeding ulcer, although MCA accused him of malingering, and NBC soon canceled the series. Although it was extremely rare back then for actors to undertake the huge expense of pursuing litigation against a studio, Garner was wealthy enough to do so, and he decided to sue MCA for $20 million over what he claimed was its fraudulent accounting, which had deprived him of his contractual share of the profits. Such successful action by a leading television star might obviously inspire all sorts of other Hollywood figures to demand similar changes.

One week after the last *Rockford Files* episode aired on NBC, Garner was driving in slow, rush-hour traffic on Coldwater Canyon Drive when his car was bumped by another vehicle. After he stopped to get insurance information, he was immediately attacked and severely beaten by the driver, who turned out to be a young former Green Beret, resulting in three days of hospitalization for 51-year-old actor. By a rather strange coincidence, the personal chauffeur of MCA Chairman Lew Wasserman happened to be present as an observer at the scene. Despite his serious injuries, Garner eventually went ahead with his lawsuit, which was finally successfully settled after eight years of litigation. But perhaps the unusual incident led many other, less well-established actors to reflect upon the sudden misfortune that might enter their lives under the wrong circumstances.



Oddly enough, the brutal public beating of one of the biggest stars on television received much less attention than one would expect, or at least I never heard of it at the time, nor during the decades that followed, only learning of it from Moldea's book on MCA's dark history. Moreover, the attack seems to have been almost entirely scrubbed from the Internet, with my inadequate Google skills only locating the most obscure sources, such as a PDF copy of an AP wire story in the Tuscaloosa News of Alabama, though the details are provided in Garner's 2011 memoirs, *The Garner Files*. It's quite possible that the incident was exactly what it purported to be, the sort of random, violent assault that can happen to any of us without cause or warning, even including leading television stars locked in bitter contract disputes with a major studio having deep Syndicate roots. But I do think the story would have fit perfectly well into Russo's

narrative of the early Chicago days of MCA in the 1930s, when its top executives worked closely with the thugs of Al Capone.

# John McCain, Jeffrey Epstein, and Pizzagate

*Our Reigning Political Puppets, Dancing to Invisible Strings*

July 29, 2019 • 6,400 Words

The death of Sen. John McCain last August revealed some important truths about the nature of our establishment media.

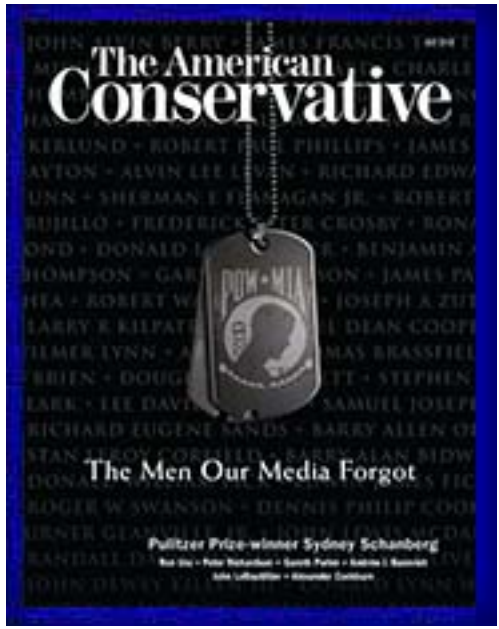
McCain's family had released word of his incurable brain cancer many months earlier and his passing at age 84 was long expected, so media outlets great and small had possessed all the time necessary for producing and polishing the packages they eventually published, and that was readily apparent from the voluminous nature of the tributes that they ran. The *New York Times*, still our national newspaper of record, allocated more than three full pages of its printed edition to the primary obituary, and this was supplemented by a considerable number of other articles and sidebars. I cannot recall any political figure other than an American president whose passing had ever received such an enormous wealth of coverage, and perhaps even some former residents of the Oval Office might have fallen short of that standard. Although I certainly didn't bother reading all of the tens of thousands of words in the *Times* or my other newspapers, the coverage of McCain's life and career seemed exceptionally laudatory across the mainstream media, liberal and conservative alike, with scarcely a negative word appearing anywhere outside the political fringe.

On the face of it, such undiluted political love for McCain might seem a bit odd to those who have followed his activities over the last couple of decades. After all, the *Times* and most of the other leading lights of our media firmament are purportedly liberal and claim to have become vehement critics of our disastrous Iraq War and other military adventures, let alone the calamitous possibility of an attack upon Iran. Meanwhile, McCain was universally regarded as the leading figure in America's "War Party," eagerly supporting all prospective and retrospective military endeavors with gleeful fury, and even making his chant of "Bomb, Bomb, Bomb Iran" the most widely remembered detail of his unsuccessful 2008 presidential campaign. So either our major media outlets somehow overlooked such striking differences on an absolutely central issue, or perhaps their true

positions on certain matters are not exactly what they seem to be, and merely constitute elements of a Kabuki-performance aimed at deceiving their more naive readers.

Even more remarkable were the discordant facts airbrushed out of McCain's history.

As the winner of the Pulitzer Prize and two George Polk awards, the late Sydney Schanberg was widely regarded as one of the greatest American war correspondents of the twentieth century. His exploits during our ill-fated Indo-Chinese War had become the basis of the Oscar-winning film *The Killing Fields*, which probably established him as the most famous journalist in America after Woodward and Bernstein of Watergate fame, and he had also served as a top editor at *The New York Times*. A decade ago, he published his greatest expose, providing a mountain of evidence that America had deliberately left behind hundreds of POWs in Vietnam and he fingered then-presidential candidate John McCain as the central figure in the subsequent official cover-up of that monstrous betrayal. The Arizona senator had traded on his national reputation as our best-known former POW to bury the story of those abandoned prisoners, permitting America's political establishment to escape serious embarrassment. As a result, Sen. McCain earned the lush rewards of our generous ruling elites, much like his own father Admiral John S. McCain, Sr., who had led the cover-up of the deliberate 1967 Israeli attack on the U.S.S. Liberty, which killed or wounded over 200 American servicemen.



As publisher of *The American Conservative*, I ran Schanberg's remarkable piece as a cover story, and across several websites over the years it has surely been read many hundreds of thousands of times, including a huge spike around the time of McCain's death. I therefore find it rather difficult to believe that the many journalists investigating McCain's background might have remained unaware of this material. Yet no hints of these facts were provided in any of the articles appearing in any remotely prominent media outlet as can be verified by searching for web pages containing "McCain and Schanberg" dated around the time of the Senator's passing.

- John McCain and the POW Cover-Up
  Sydney Schanberg • May 25, 2010 • 8,200 Words

Schanberg's journalistic stature had hardly been forgotten by his former colleagues. Upon his death a couple of years ago, the *Times* ran a very long and glowing obituary, and a few months later I attended the memorial tribute to his life and career held at the *New York Times* headquarters building, which included more than two hundred prominent journalists mostly from his own generation, including those of the highest rank. *Times* Publisher Arthur Sulzberger, Jr. gave a speech describing how as a young man he had always so greatly admired Schanberg and had been mortified by the unfortunate circumstances of his departure from the family's newspaper. Former Executive Editor Joseph Lelyveld recounted the many years he had worked closely with the man he had long

considered his closest friend and colleague, someone whom he almost seemed to regard as his older brother. But during the two hours of praise and remembrance scarcely a single word was uttered in public about the gigantic story that had occupied the last two decades of Schanberg's celebrated career.

This same blanket of media silence also enveloped the very serious accusations regarding McCain's own Vietnam War record. A few years ago, I drew upon the *Times* and other fully mainstream sources to strongly suggest that McCain's stories of his torture as a POW were probably fictional, invented to serve as a cover and an excuse for the very real record of his wartime collaboration with his Communist captors. Indeed, at the time our American media had reported his activities as one of the leading propagandists of our North Vietnamese foes, but these facts were later flushed down the memory-hole. McCain's father then ranked as one of America's top military officers, and it seems likely that his personal political intervention ensured that the official narrative of his son's wartime record was transmuted from traitor to war-hero, thereby allowing the younger McCain to later embark upon his celebrated political career.

- John McCain: When "Tokyo Rose" Ran for President
  Ron Unz • March 9, 2015 • 4,200 Words

The story of the abandoned Vietnam POWs and McCain's own Communist propaganda broadcasts hardly exhaust the catalog of the major skeletons in the late Senator's closet. McCain was regularly described by reporters as being remarkably hot-headed and having a violent temper, but the national press left it to the alternative media to investigate the real-life implications of those rather suggestive phrases.

In a September 1, 2008 *Counterpunch* expose later published online, Alexander Cockburn reported that interviews with two emergency room physicians in Phoenix revealed that around the time that McCain was sucked into the political maelstrom of the Keating Five Scandal, his wife Cindy was admitted to her local hospital suffering from a black eye, facial bruises, and scratches consistent with physical violence, and this same situation occurred two additional times over the next few years. Cockburn also noted several other highly suspicious marital incidents during the years that followed, including the Senator's wife appearing with a bandaged wrist and her arm in a sling not long after she joined her husband on the 2008 campaign

trail, an injury reported by our strangely incurious political journalists as being due to "excessive hand-shaking." It's an odd situation when a tiny leftist newsletter can easily uncover facts that so totally eluded the vast resources of our entire national press corps. If there were credible reports that Melania Trump had repeatedly been admitted to local emergency rooms suffering from black eyes and facial bruises, would our corporate media have remained so uninterested in any further investigation?

McCain had first won his Arizona Congressional seat in 1982, not long after he moved into the state, with his campaign bankrolled by his father-in-law's beer-distributorship fortune, and that inheritance eventually elevated the McCain household into one of the wealthiest in the Senate. But although the Senator spent the next quarter-century in public life, even nearly upsetting George W. Bush for the 2000 Republican presidential nomination, only in late 2008 did I learn from the *Times* that the Phoenix beer-monopoly in question, then valued at around $200 million, had accrued to a man whose lifelong business partner Kemper Marley had long been deeply linked to organized crime. Indeed, close associates of that latter individual had been convicted by a jury of the car-bomb assassination of a Phoenix investigative crime reporter just a few years before McCain's sudden triumphal entrance into Arizona politics. Perhaps such guilt-by-association is improper, but would our national press-corps have remained silent if the personal fortune of our current president were only a step or two removed from the car-bomb assassins of an inquisitive journalist who died while investigating mobsters?

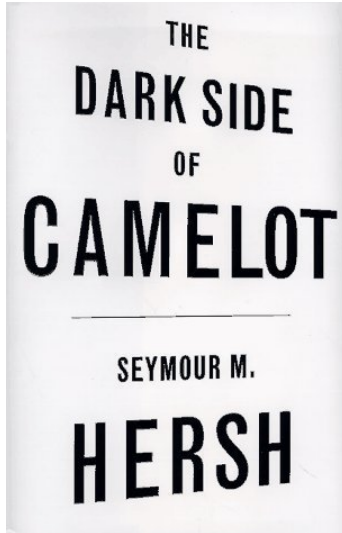
As I gradually became aware of these enormities casually hidden in McCain's background, my initial reaction was disbelief that someone whose record was so deeply tarnished in so many different ways could ever have reached such a pinnacle of American political power. But as the media continued to avert its eyes from these newly revealed facts, even those disclosed in the pages of the *Times* itself, I gradually began to consider matters in a different light. Perhaps McCain's elevation to great American political power was not *in spite* of the devastating facts littering his personal past, but *because* of them. As I wrote a few years ago:

> Today when we consider the major countries of the world we see that in many cases the official leaders are also the leaders in actuality: Vladimir Putin calls the shots in Russia, Xi Jinping and his top Politburo colleagues do the same in China, and so forth. However, in America and in some other Western countries, this seems to be less and less the case, with top national figures

merely being attractive front-men selected for their popular appeal and their political malleability, a development that may eventually have dire consequences for the nations they lead. As an extreme example, a drunken Boris Yeltsin freely allowed the looting of Russia's entire national wealth by the handful of oligarchs who pulled his strings, and the result was the total impoverishment of the Russian people and a demographic collapse almost unprecedented in modern peacetime history.

An obvious problem with installing puppet rulers is the risk that they will attempt to cut their strings, much like Putin soon outmaneuvered and exiled his oligarch patron Boris Berezovsky. One means of minimizing such risk is to select puppets who are so deeply compromised that they can never break free, knowing that the political self-destruct charges buried deep within their pasts could easily be triggered if they sought independence. I have sometimes joked with my friends that perhaps the best career move for an ambitious young politician would be to secretly commit some monstrous crime and then make sure that the hard evidence of his guilt ended up in the hands of certain powerful people, thereby assuring his rapid political rise.

In physics, when an object deviates from its expected trajectory for inexplicable reasons, we assume that some unknown force has been at work, and tracing the record of such deviations may help to determine the characteristic properties of the latter. Over the years, I've increasingly become aware of such strange ideological deviations in public policy, and although some are readily explained, others suggest the existence of hidden forces far beneath the surface of our regular political world. This same situation may have occurred throughout our history, and sometimes the political decisions that so baffled contemporaries eventually came to light decades later.



In *The Dark Side of Camelot*, famed investigative reporter Seymour Hersh claimed that secret blackmail evidence of JFK's extra-marital affairs probably played a crucial role in having his administration overrule the unanimous verdict of all top Pentagon advisors and award the largest military procurement contract in U.S. history to General Dynamics instead of Boeing, thereby saving the former company from likely bankruptcy and its major organized-crime shareholders from devastating financial losses. Hersh also suggests that a similar factor likely explains JFK's last-minute reversal in the choice of his Vice President, a decision that landed Lyndon Johnson on the 1960 ticket and placed him in the White House after Kennedy's 1963 assassination.

As I recently mentioned, Sen. Estes Kefauver shifted the focus of his 1950s Organized Crime Hearings after the Chicago Syndicate confronted him with the photographs of his sexual encounter with two mob-supplied women. A decade later, California Attorney-General Stanley Mosk suffered much the same fate, with the facts remaining hidden for over twenty years.

Similar rumors swirl around events much farther back in history as well, sometimes with enormous consequences. Well-placed contemporary sources have claimed that Samuel Untermyer, a wealthy Jewish lawyer, purchased the secret correspondence between Woodrow Wilson and his longtime mistress, and that the existence of that powerful leverage may have been an important factor behind Wilson's astonishingly rapid rise from president of Princeton in 1910 to governor of New Jersey in 1911 to president of the United States in 1912. Once in office, Wilson signed the controversial legislation

establishing the Federal Reserve system in 1913 and also named Louis Brandeis as the first Jewish member of the U.S. Supreme Court despite the public opposition of nearly our entire legal establishment. Wilson's swiftly changing views on American involvement in the First World War may also have been influenced by such personal pressures rather than solely determined by his perceptions of the national interest.

Without naming any names, since 2001 it has been difficult to avoid noticing that one of the most zealous and committed supporters of the Neocon party-line on all Middle Eastern foreign policy matters has been a leading Republican senator from one of the most socially-conservative Southern states, a man whose rumored personal inclinations have long circulated on the Internet. The strikingly-sudden reversal of this individual on a major policy question certainly supports these suspicions. There have also been several other such examples involving prominent Republicans.

But consider the far different situation of Rep. Barney Frank of Massachusetts, who in 1987 became the first member of the Congress to voluntarily admit that he was gay. Not long afterward, a notorious scandal erupted when it was revealed that his own DC townhouse had been used by a former boyfriend as headquarters for a male-prostitution ring. Frank claimed to have had no knowledge of that sordid situation, and his liberal Massachusetts constituents apparently accepted that excuse, since he was resoundingly reelected and went on to serve another 24 years in Congress. But surely if Frank had been a Republican from a socially-conservative district, anyone possessing such evidence would have totally controlled his political survival, and with Frank spending several years as Chairman of the very powerful House Financial Services Committee, the value of such a hold would have been enormous.

This demonstrates the undeniable reality that what constitutes effective blackmail material may vary tremendously across different eras and regions. Today, it is widely accepted that longtime FBI Director J. Edgar Hoover lived his life as a deeply-closeted homosexual and there seem to be serious claims that he also had some black ancestry, with the secret evidence of these facts probably helping to explain why for decades he stubbornly refused to admit the existence of American organized crime or focus his G-men on efforts to uproot it. But in today's America, Hoover would have proudly proclaimed his sexuality and racial ancestry in a *New York Times Magazine* cover-story, rightly believing that they greatly enhanced his political invulnerability on the national stage. There are lurid rumors

that the Syndicate possessed secret photos of Hoover wearing a dress and high-heels, but just a few years ago Rep. Mike Honda of San Jose desperately placed his eight-year-old transgendered grand-daughter front-and-center in his unsuccessful attempt to win reelection.

The decades have certainly softened the effectiveness of many forms of blackmail, but pedophilia still ranks as an extremely powerful taboo. There seems to be a great deal of evidence that powerful organizations and individuals have successfully managed to suppress credible accusations of that practice for very long periods of time unless some group with substantial media influence chose to target the offenders for unmasking.

The most obvious example is the Catholic Church, and the failings of its American and international hierarchy in that regard have regularly made the front pages of our leading newspapers. But until the early 2000s and the breakthrough reporting of the *Boston Globe* as recounted in the Oscar-winning film *Spotlight*, the Church had routinely fended off such scandals.

Consider also the remarkable case of British television personality Sir Jimmy Savile, one of his country's most admired celebrities, eventually knighted for his public service. Only shortly after his death at age 84 did the press begin revealing that he had probably molested many hundreds of children during his long career. Accusations by his young victims had stretched back across forty years, but his criminal activities had seemingly been protected by his wealth and celebrity, along with his numerous supporters in the media.

There is also the intriguing example of Dennis Hastert. As the longest serving Republican Speaker of the House in U.S. history, holding office during 1999-2007, Hastert was third in line to the Presidency and even ranked as our nation's top Republican elected official during some of that period. Based upon my newspaper readings, he had always struck me as a rather bland and ordinary individual, with journalists sometimes even strongly hinting at his mediocrity, so that I occasionally wondered just how someone so unimpressive could have risen to such extremely high national office.

Then a few years ago, he was suddenly thrust back into the headlines, arrested by the FBI and charged with financial crimes relating to what apparently had been his past history of abusing young boys, at least one of whom had committed suicide and with the federal judge who

sent him to prison denouncing him as "a serial child molester" at sentencing. Perhaps I've led an overly sheltered life, but my impression is that only a tiny sliver of Americans have had a long record of child molestation, and all things being equal, it seems rather unlikely that someone of such a background but who possesses no other great talents or skills would rise to near the absolute top of our political heap. So perhaps not all things were otherwise equal. If some powerful elements held the hard evidence that placed a particular elected official under their total control, making great efforts to elevate him to Speaker of the House would be a very shrewd investment.

At times the unwillingness of our national media to see major stories in front of their very noses reaches ridiculous extremes. During the summer of 2007, the Internet was ablaze with claims that Sen. John Edwards, a runner-up in the 2004 Democratic presidential primaries, had just fathered a child with his mistress, and those reports were backed by seemingly-credible visual evidence, including photos showing the married senator holding his new-born baby. Yet as the days and even the weeks went by, not a whiff of this salacious scandal ever reached the pages of any of my morning newspapers or the rest of the mainstream media although it was a top conversation topic everywhere else. Eventually, the *National Enquirer*, a notorious gossip tabloid, scored a journalistic first, by receiving a Pulitzer Prize nomination for breaking the story that no other outlet seemed willing to cover. Would our media have similarly averted its eyes from a newborn baby Trump coming from the wrong side of the bed?

Over the years, it has become increasingly obvious to me that nearly all elements of our national media had often quite willing to enlist in a "conspiracy of silence" to minimize or entirely ignore stories of major public importance and tremendous potential interest to their readership. I could easily have doubled or tripled the number of such notable examples I provided above without much effort. Moreover, it is quite intriguing that so many of these cases involve the sort of criminal or sexual misbehavior that would be ideally suited for blackmailing powerful individuals who are less likely to be vulnerable to other influences. So perhaps many of the elected officials situated at the top of our democratic system merely reign as political puppets, dancing to invisible strings.

Given my awareness of this remarkable track-record of major media cover-ups, I'm ashamed to admit that I had paid almost no attention to

the Jeffrey Epstein case until it exploded across the national headlines earlier this month, suddenly becoming one of the biggest news stories in our country.

For many years, reports about Epstein and his illegal sex-ring had regularly circulated on the fringes of the Internet, with agitated commenters citing the case as proof of the dark and malevolent forces that secretly controlled our corrupted political system. But I almost entirely ignored these discussions, and I'm not sure that I ever once clicked on a single link.

Probably one reason I paid so little attention to the topic was the exceptionally lurid nature of the claims being made. Epstein was supposedly an enormously wealthy Wall Street financier of rather mysterious personal background and source of funds, who owned a private island and an immense New York City mansion, both regularly stocked with harems of underage girls provided for sexual purposes. He allegedly hobnobbed on a regular basis with Bill Clinton, Prince Andrew, Harvard's Alan Dershowitz, and numerous other figures in the international elite, as well as a gaggle of ordinary billionaires, frequently transporting those individuals on his personal jet known as "the Lolita Express" for the role it played in facilitating illegal secret orgies with young girls. When right-wing bloggers on obscure websites claimed that former President Clinton and the British Royals were being sexually serviced by the underage girls of a James Bond super-villain brought to life, I just naturally assumed those accusations were the wildest sort of Internet exaggeration.

Moreover, these angry writers did occasionally let slip that the fiendish target of their wrath had already been charged in a Florida courtroom, eventually pleading guilty to a single sexual offense and receiving a thirteen month jail sentence, mitigated by very generous work-release provisions. This hardly seemed like the sort of judicial punishment that would lend credence to the fantastical accusations against him. If Epstein had already been investigated by law enforcement authorities and given the sentence one might expect for writing a bad check, I found it quite unlikely that he was actually the Goldfinger or Dr. No that deluded Internet activists made him out to be.

Then these same wild, implausible claims previously found only on anonymous comment-threads were suddenly repeated as solid fact on the front pages of the *Times* and all my other morning newspapers, and the former federal prosecutor who had signed off on Epstein's legal slap-on-the-wrist was forced to resign from the Trump Cabinet.

Epstein's safe had been found to contain a huge cache of child-pornography and other highly suspicious material, and he was quickly rearrested on charges that could send him to federal prison for decades. Prestigious media outlets described Epstein as the mastermind of a huge sex-trafficking ring, and numerous underage victims began coming forward, telling their stories of how he had molested, raped, and pimped them. The author of a long 2003 Epstein profile that had appeared in *Vanity Fair* explained that she had personally spoken to some of his victims and included their highly-credible accounts in her article, but that those portions had been stricken and removed by her timorous editors.

As presented by these media outlets, Epstein's personal rise also seemed rather inexplicable unless he had benefited from some powerful network or similar organization. Lacking any college degree or credentials, he had somehow gotten a job teaching at one of New York City's most elite prep schools, then quickly jumped to working at a top investment bank, rising to partner with astonishing speed until he was fired a few years later for illegal activity. Despite such a scanty and doubtful record, he was soon managing money for some of America's wealthiest individuals, and keeping so much of it for himself that he was regularly described as a billionaire. According to newspaper accounts, his great specialty was "making connections for people."

Obviously, Epstein was a ruthlessly opportunistic financial hustler. But extremely wealthy individuals must surely be surrounded by great swarms of ruthlessly opportunistic financial hustlers, and why would he have been so much more successful than all those others? Perhaps a clue comes from the offhand remark of Epstein's now-disgraced prosecutor, saying that he had been told to go very easy on the sex-trafficker because he "belonged to intelligence." The vague phrasing of that statement raises questions about whether the intelligence service may not have been one controlled by the U.S. government.

Philip Giraldi, a highly-regarded former CIA officer, put things very plainly when he suggested that Epstein had probably been working for the Israeli Mossad, operating "honey traps" to obtain blackmail information on all the wealthy and powerful individuals whom he regularly plied with underage girls. Indeed, longtime Canadian journalist Eric Margolis recounted his early 1990s visit to Epstein's enormous NYC mansion, in which he had barely crossed the threshold before he was offered an "intimate massage" by one of the many young girls there, presumably in a bedroom well-stocked with hidden cameras.

Given my personal lack of interest in the Epstein case, then or now, perhaps a few of these details may be garbled, but it seems undeniable that he was exactly the sort of remarkable renegade often faced by Agent 007 in the movies, and the true facts will presumably come out at his trial. Or perhaps not. Whether he lives to see trial is not entirely clear given the considerable number of powerful individuals who might prefer that hidden facts remain hidden, and the Friday newspapers reported that Epstein had been found injured and unconscious in his prison cell.

When one seemingly implausible pedophilia scandal has suddenly jumped from obscure corners of the Internet to the front pages of our leading newspapers, we must naturally begin to wonder whether others might not eventually do the same. And a very likely candidate comes to mind, one that seemed to me far better documented than the vague accusations being thrown about over the last few years against a wealthy financier once given a thirteen-month jail sentence in Florida a decade earlier.

I don't use Social Media myself, but near the end of the 2016 presidential campaign, I gradually began seeing more and more Trump supporters referring to something called "Pizzagate," a burgeoning sexual scandal that they claimed would bring down Hillary Clinton and many of the top leaders of her party, with the chatter actually increasing after Trump was elected. As near as I could tell, the whole bizarre theory had grown up on the far-right fringe of the Internet, with the utterly fantastical plot having something to do with stolen secret emails, DC pizza parlors, and a ring of pedophiles situated near the top of the Democratic Party. But given all the other strange and unlikely things I'd gradually discovered about our history, it didn't seem like something I could necessarily dismiss out of hand.

At the beginning of December, a right-wing blogger produced a lengthy exposition of the Pizzagate charges, which finally gave me some understanding of what was actually under discussion, and I soon made arrangements to republish his article. It quickly attracted a great deal of interest, and some websites pointed to it as the best single introduction to the scandal for a general audience.

- Pizzagate
  Aedon Cassiel • December 2, 2016 • 3,100 Words

A couple of weeks later, I republished an additional article by the

same writer, describing a long list of previous pedophilia scandals that had occurred in elite American and European political circles. Although many of these seemed to be solidly documented, nearly all of them had received minimal coverage by our mainstream media outlets. And if such political pedophile rings had existed in the relatively recent past, was it so totally implausible that there might be another one simmering beneath the surface of today's Washington DC?

- Precedents for Pizzagate
  Aedon Cassiel • December 23, 2016 • 6,200 Words

Those interested in the details of the Pizzagate Hypothesis are advised to read these articles, especially the first one, but I might as well provide a brief summary.

John Podesta had been a longtime fixture in DC political circles, becoming chief of staff to President Bill Clinton in 1998, and afterward remaining one of the most powerful figures in the Democratic Party establishment. While serving as as chairman of Hillary Clinton's 2016 presidential campaign, his apparent carelessness with the password security of his Gmail account allowed it to easily be hacked, and tens of thousands of his personal emails were soon published on WikiLeaks. A swarm of young anti-Clinton activists began scouring this treasure-trove of semi-confidential information, seeking evidence of mundane bribery and corruption, but instead they came across some quite odd exchanges, seemingly written in coded language.

Now use of coded language in a supposedly secure private email account raises all sorts of natural suspicions regarding what might have been under discussion, with the most likely possibilities being illegal drugs or sex. But most of the references didn't seem to fit the former category, and in our remarkably libertine era, in which political candidates compete for the right to be Grand Marshal at an annual Gay Pride Parade, one of the few sexual activities still discussed only in whispers would seem to be pedophilia, with some of the very strange remarks possibly hinting at this.

The researchers also soon discovered that his brother Tony Podesta, one of the wealthiest and most successful lobbyists in DC, had extremely odd tastes in art. Major items of his very extensive personal collection seemed to represent tortured or murdered bodies, and one of his favorite artists was best known for paintings depicting young children being held captive, lying dead, or suffering under severe

distress. Such peculiar artwork obviously isn't illegal, but it might naturally arouse some suspicions. And oddly enough, arch-Democrat Podesta had long been a close personal friend of former Republican House Speaker and convicted child-molester Dennis Hastert, welcoming him back into DC society after his release from prison.

Furthermore, some of the rather suspiciously-worded Podesta emails referred to events held at a local DC pizza parlor, greatly favored by the Democratic Party elite, whose owner was the gay former boyfriend of David Brock, a leading Democratic activist. The public Instagram account of that pizza-entrepreneur apparently contained numerous images of young children, sometimes tied or bound, with those images frequently labeled by hashtags using the traditional gay slang for underage sexual targets. Some photos showed the fellow wearing a tee-shirt bearing the statement "I Love Children" in French, and by a very odd coincidence, his possibly assumed name was phonetically identical to that very same French phrase, thus proclaiming to the world that he was "a lover of children." Closely connected Instagram accounts also included pictures of young children, sometimes shown amid piles of high-value currency, with queries about how much those particular children might be worth. None of this seemed illegal, but surely any reasonable person would regard the material as extremely suspicious.

DC is sometimes described as "Powertown," being the location of the individuals who make America's laws and govern our society, with local political journalists being closely attuned to the relative status of such individuals. And oddly enough, *GQ Magazine* had ranked that gay pizza parlor owner with a strange focus on young children as being one of the 50 most powerful people in our national capital, placing him far ahead of many Cabinet members, Senators, Congressional Chairmen, Supreme Court justices, and top lobbyists. Was his pizza really that delicious?

These few paragraphs provide merely a sliver of the large quantity of highly-suspicious material surrounding various powerful figures at the apex of the DC political world. A vast cloud of billowing smoke is certainly no proof of any fire, but only a fool would completely ignore it without attempting further investigation.

I usually regard videos as a poor means of imparting serious information, being far less effective and meaningful than the simple printed word. But the overwhelming bulk of the evidence supporting the Pizzagate Hypothesis consists of visual images and screen shots, and these are naturally suited to a video presentation.

Some of the best summaries of the Pizzagate case were produced by a young British YouTuber named Tara McCarthy, whose work was published under the name of “Reality Calls,” and her videos were viewed hundreds of thousands of times. Although her channel was eventually banned and her videos purged, copies were later reloaded to other accounts, both on YouTube and BitChute. Some of the evidence she presents seemed rather innocuous or speculative to me and other elements were probably based upon her unfamiliarity with American society and culture. But a great deal of extremely suspicious material remains, and I would suggest that people watch the videos and decide for themselves.

Around the same time that I first became familiar with the details of the Pizzagate controversy, the topic also started reaching the pages of my morning newspapers, but in an rather strange manner. Political stories began giving a sentence or two to the "Pizzagate hoax," describing it as a ridiculous right-wing "conspiracy theory" but excluding all relevant details. I had an eerie feeling that some unseen hand had suddenly flipped a switch causing the entire mainstream media to begin displaying identical brightly flashing neon signs declaring "Pizzagate Is False—Nothing To See There!" I couldn't recall any previous example of such a strange media reaction to some obscure Internet controversy.

Articles in the *Washington Post* and the *Los Angeles Times* also suddenly appeared denouncing the entirety of the alternative media—Left, Right, and Libertarian—as "fake news" websites promoting Russian propaganda, while urging that their content be blocked by all patriotic Internet giants such as Facebook, Twitter, and Google. Prior to that moment, I'd never even heard the term "fake news" but suddenly it was ubiquitous across the media, once again almost as if some unseen hand had suddenly flipped a switch.

I naturally began to wonder whether the timing of these two strange developments was entirely coincidental. Perhaps Pizzagate was indeed true and struck so deeply at the core of our hugely corrupted political system that the media efforts to suppress it were approaching the point of hysteria.

Not long afterward, Tara McCarthy's detailed Pizzagate videos were purged from YouTube. This was among the very first instances of video content being banned despite fully conforming to all existing YouTube guidelines, another deeply suspicious development.

I also noticed that mere mention of Pizzagate had become politically lethal. Donald Trump had selected Lt. Gen. Michael Flynn, former head of the Defense Intelligence Agency, as his National Security Advisor, and Flynn's son served as the latter's chief of staff. The younger Flynn happened to Tweet out a couple of links to Pizzagate stories, pointing out that the accusations hadn't yet been actually investigated let alone disproven, and very soon afterward, he was purged from the Trump transition team, foreshadowing his father's fall a few weeks later. It seemed astonishing to me that a few simple Tweets about an Internet controversy could have such huge real-life impact near the very top of our government.

The media continued its uniform drumbeat of "Pizzagate Has Been

Disproven!" but we were never told how or by whom, and I was not the only individual to notice the hollowness of such denunciations. An award-winning investigative journalist named Ben Swann at a CBS station in Atlanta broadcast a short television segment summarizing the Pizzagate controversy and noting that contrary to widespread media claims, Pizzagate had neither been investigated nor debunked. Swann was almost immediately purged by CBS but a copy of his television segment remains available for viewing on the Internet.

There is an old wartime proverb that enemy flak is always heaviest over the most important target, and the remarkably ferocious wave of attacks and censorship against anyone broaching the subject of Pizzagate seems to raise obvious dark suspicions. Indeed, the simultaneous waves of attacks against all alternative media outlets as "Russian propaganda outlets" laid the basis for the continuing regime of Social Media censorship that has become a central aspect of today's world.

Pizzagate may or may not turn out to be true, but the ongoing Internet crackdown has similarly engulfed topics of a somewhat similar nature but with vastly stronger documentation. Although I don't use Twitter myself, I encountered the obvious implications of this new censorship policy following McCain's death last August. The senator had died on

a Saturday afternoon, and readership of Sydney Schanberg's long 2008 expose quickly exploded, with numerous individuals Tweeting out the story and a large fraction of our incoming traffic therefore coming from Twitter. This continued until the following morning, at which point the huge flood of Tweets continued to grow, but all incoming Twitter traffic suddenly and permanently vanished, presumably because "shadow banning" had rendered those Tweets invisible. My own article on McCain's very doubtful war record simultaneously suffered the same fate, as did numerous other articles of a controversial nature that we published later that same week.

Perhaps that censorship decision was made by some ignorant young intern at Twitter, casually choosing to ban as "hate speech" or "fake news" a massively-documented 8,400 word expose by one of America's most distinguished journalists, a Pulitzer-prize winning former top editor at *The New York Times*.

Or perhaps certain political-puppeteers who had spent decades controlling that late Arizona senator sought to ensure that their political puppet-strings remained invisible even after his death.

# Understanding World War II

September 23, 2019 • 20,500 Words

## Pat Buchanan and "the Unnecessary War"

In late 2006 I was approached by Scott McConnell, editor of *The American Conservative (TAC)*, who told me that his small magazine was on the verge of closing without a large financial infusion. I'd been on friendly terms with McConnell since around 1999, and greatly appreciated that he and his *TAC* co-founders had been providing a focal point of opposition to America's calamitous foreign policy of the early 2000s.

In the wake of 9/11, the Israel-centric Neocons had somehow managed to seize control of the Bush Administration while also gaining complete ascendancy over America's leading media outlets, purging or intimidating most of their critics. Although Saddam Hussein clearly had no connection to the attacks, his status as a possible regional rival to Israel had established him as their top target, and they soon began beating the drums for war, with America finally launching its disastrous invasion in March 2003.

Among print magazines, *TAC* stood almost alone in whole-hearted opposition to these policies, and had attracted considerable attention when Founding Editor Pat Buchanan published "Whose War?", pointing the finger of blame directly at the Jewish Neocons responsible, a truth very widely recognized in political and media circles but almost never publicly voiced. David Frum, a leading promoter of the Iraq War, had almost simultaneously unleashed a *National Review* cover story denouncing as "unpatriotic"—and perhaps "anti-Semitic"—a very long list of conservative, liberal, and libertarian war critics, with Buchanan near the very top, and the controversy and name-calling continued for some time.

Given this recent history, I was concerned that *TAC*'s disappearance might leave a dangerous political void, and being then in a relatively strong financial position, I agreed to rescue the magazine and become its new owner. Although I was much too preoccupied with my own software work to have any direct involvement, McConnell named me publisher, probably hoping to bind me to his magazine's continuing survival and ensure future financial infusions. My title was purely a

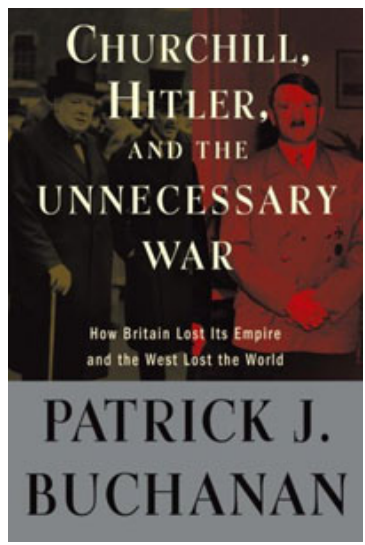
nominal one, and over the next few years, aside from writing additional checks my only involvement usually amounted to a five-minute phone call each Monday morning to see how things were going.

About a year after I began supporting the magazine, McConnell informed me that a major crisis was brewing. Although Pat Buchanan had severed his direct ties with the publication some years earlier, he was by far the best-known figure associated with *TAC*, so that it was still widely—if erroneously—known as "Pat Buchanan's magazine." But now McConnell had heard that Buchanan was planning to release a new book supposedly glorifying Adolf Hitler and denouncing America's participation in the world war to defeat the Nazi menace. Promoting such bizarre beliefs would surely doom Buchanan's career, but *TAC* was already under continuous attack by Jewish activists, and the resulting "Neo-Nazi" guilt by association might easily sink the magazine as well.

In desperation, McConnell had decided to protect his publication by soliciting a very hostile review by conservative historian John Lukacs, which would thereby insulate *TAC* from the looming disaster. Given my current role as *TAC*'s funder and publisher, he naturally sought my approval in this harsh break with his own political mentor. I told him that the Buchanan book certainly sounded rather ridiculous and his own defensive strategy a pretty reasonable one, and I quickly returned to the problems I faced in my own all-consuming software project.

Although I'd been a little friendly with Buchanan for a dozen years or so, and greatly admired his courage in opposing the Neocons on foreign policy, I wasn't too surprised to hear that he might be publishing a book promoting some rather strange ideas. Just a few years earlier, he'd released *The Death of the West*, which became an unexpected best-seller. After my friends at *TAC* had raved about its brilliance, I decided to read it for myself, and was greatly disappointed. Although Buchanan had generously quoted an excerpt from my own *Commentary* cover-story "California and the End of White America," I felt that he'd completely misconstrued my meaning, and the book overall seemed a rather poorly-constructed and rhetorically right-wing treatment of the complex issues of immigration and race, topics upon which I'd been heavily focusing since the early 1990s. So under the circumstances, I was hardly surprised that the same author was now publishing some equally silly book about World War II, perhaps causing severe problems for his erstwhile *TAC* colleagues.

Months later, Buchanan's history and the hostile *TAC* review both appeared, and as expected, a storm of controversy erupted. Mainstream publications had largely ignored the book, but it seemed to receive enormous praise from alternative writers, some of whom fiercely denounced *TAC* for having attacked it. Indeed, the response was so extremely one-sided that when McConnell discovered that a totally obscure blogger somewhere had agreed with his own negative appraisal, he immediately circulated those remarks in a desperate attempt at vindication. Longtime *TAC* contributors whose knowledge of history I much respected, including Eric Margolis and William Lind, had praised the book, so my curiosity finally got the better of me and I decided to order a copy and read it for myself.



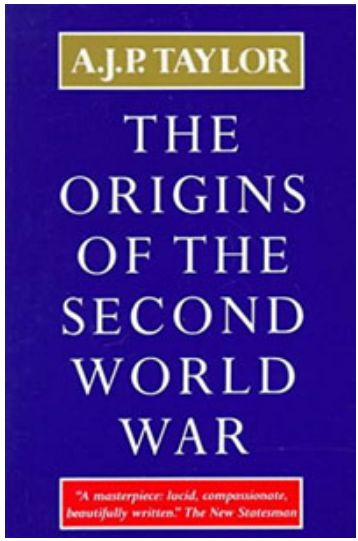
I was quite surprised to discover a work very different from what I had expected. I had never paid much attention to twentieth century American history and my knowledge of European history in that same era was only slightly better, so my views were then mostly rather conventional, having been shaped by my History 101 courses and what I'd picked up in decades of reading my various newspapers and magazines. But within that framework, Buchanan's history seemed to fit quite comfortably.

The first part of his volume provided what I had always considered the standard view of the First World War. In his account of events, Buchanan explained how the complex network of interlocking alliances had led to a giant conflagration even though none of the existing leaders had actually sought that outcome: a huge European powder-keg had been ignited by the spark of an assassination in Sarajevo.

But although his narrative was what I expected, he provided a wealth of interesting details previously unknown to me. Among other things, he persuasively argued that the German war-guilt was somewhat less than that of most of the other participants, also noting that despite the endless propaganda of "Prussian militarism," Germany had not fought a major war in 43 years, an unbroken record of peace considerably better than that of most of its adversaries. Moreover, a secret military agreement between Britain and France had been a crucial factor in the unintended escalation, and even so, nearly half the British Cabinet had come close to resigning in opposition to the declaration of war against Germany, a possibility that would have probably led to a short and limited conflict confined to the Continent. I'd also seldom seen emphasized that Japan had been a crucial British ally, and that the Germans probably would have won the war if Japan had fought on the other side.

However, the bulk of the book focused on the events leading up to the Second World War, and this was the portion that had inspired such horror in McConnell and his colleagues. Buchanan described the outrageous provisions of the Treaty of Versailles imposed upon a prostrate Germany, and the determination of all subsequent German leaders to redress it. But whereas his democratic Weimar predecessors had failed, Hitler had managed to succeed, largely through bluff, while also annexing German Austria and the German Sudetenland of Czechoslovakia, in both cases with the overwhelming support of their populations.

Buchanan documented this controversial thesis by drawing heavily upon numerous statements by leading contemporary political figures, mostly British, as well as the conclusions of highly-respected mainstream historians. Hitler's final demand, that 95% German Danzig be returned to Germany just as its inhabitants desired, was an absolutely reasonable one, and only a dreadful diplomatic blunder by the British had led the Poles to refuse the request, thereby provoking the war. The widespread later claim that Hitler sought to conquer the world was totally absurd, and the German leader had actually made every effort to avoid war with Britain or France. Indeed, he was generally quite friendly towards the Poles and had been hoping to enlist Poland as a German ally against the menace of Stalin's Soviet Union.



A.J.P. TAYLOR
THE ORIGINS OF THE SECOND WORLD WAR
"A masterpiece: lucid, compassionate, beautifully written." The New Statesman

Although many Americans might have been shocked at this account of the events leading up to the outbreak of the Second World War, Buchanan's narrative accorded reasonably well with my own impression of that period. As a Harvard freshman, I had taken an introductory history course, and one of the primary required texts on World War II had been that of A.J.P. Taylor, a renowned Oxford University historian. His famous 1961 work *Origins of the Second World War* had very persuasively laid out a case quite similar to that of Buchanan, and I'd never found any reason to question the judgment of my professors who had assigned it. So if Buchanan merely seemed to be seconding the opinions of a leading Oxford don and members of the Harvard history faculty, I couldn't quite understand why his new book would be regarded as being beyond the pale.

Admittedly, Buchanan also included a very harsh critique of Winston Churchill, cataloging a long list of his supposedly disastrous policies and political reversals, and assigning him a good share of the blame for Britain's involvement in both world wars, fateful decisions that consequently led to the collapse of the British Empire. But although my knowledge of Churchill was far too scanty to render a verdict, the case he made for the prosecution seemed reasonably strong. The Neocons already hated Buchanan and since they notoriously worshiped Churchill as a cartoon super-hero, any firestorm of criticism from those quarters would hardly be surprising. But the book overall seemed a very solid and interesting history, the best work by Buchanan that I had ever read, and I gently gave my favorable assessment to McConnell, who was obviously rather disappointed. Not long afterward, he decided to relinquish his role as *TAC* editor to

Kara Hopkins, his longtime deputy, and the wave of vilification he had recently endured from many of his erstwhile Buchananite allies surely must have contributed to this.

## Purging Our Leading Historians and Journalists

Although my knowledge of the history of the Second World War was quite rudimentary back in 2008, over the decade that followed I embarked upon a great deal of reading in the history of that momentous era, and my preliminary judgment in the correctness of Buchanan's thesis seemed strongly vindicated.

The recent 70th anniversary of the outbreak of the conflict that consumed so many tens of millions of lives naturally provoked numerous historical articles, and the resulting discussion led me to dig out my old copy of Taylor's short volume, which I reread for the first time in nearly forty years. I found it just as masterful and persuasive as I had back in my college dorm room days, and the glowing cover-blurbs suggested some of the immediate acclaim the work had received. *The Washington Post* lauded the author as "Britain's most prominent living historian," *World Politics* called it "Powerfully argued, brilliantly written, and always persuasive," *The New Statesman*, Britain leading leftist magazine, described it as "A masterpiece: lucid, compassionate, beautifully written," and the august *Times Literary Supplement* characterized it as "simple, devastating, superlatively readable, and deeply disturbing." As an international best-seller, it surely ranks as Taylor's most famous work, and I can easily understand why it was still on my college required reading list nearly two decades after its original publication.

Yet in revisiting Taylor's ground-breaking study, I made a remarkable discovery. Despite all the international sales and critical acclaim, the book's findings soon aroused tremendous hostility in certain quarters. Taylor's lectures at Oxford had been enormously popular for a quarter century, but as a direct result of the controversy "Britain's most prominent living historian" was summarily purged from the faculty not long afterwards. At the beginning of his first chapter, Taylor had noted how strange he found it that more than twenty years after the start of the world's most cataclysmic war no serious history had been produced carefully analyzing the outbreak. Perhaps the retaliation that he encountered led him to better understand part of that puzzle.

Taylor was hardly alone in suffering such retribution. Indeed, as I have gradually discovered over the last decade or so, his fate seems to have been an exceptionally mild one, with his great existing stature partially insulating him from the backlash following his objective analysis of the historical facts. And such extremely serious professional consequences were especially common on our side of the Atlantic, where many of the victims lost their long-held media or academic positions, and permanently vanished from public view during the years around World War II.

I had spent much of the 2000s producing a massive digitized archive containing the full contents of hundreds of America's most influential periodicals from the last two centuries, a collection totaling millions of articles. And during this process, I was repeatedly surprised to come across individuals whose enormous presence clearly marked them as among the leading public intellectuals of their day, but who had later disappeared so completely that I had scarcely ever been aware of their existence. I gradually began to recognize that our own history had been marked by an ideological Great Purge just as significant if less sanguinary than its Soviet counterpart. The parallels seemed eerie:

> I sometimes imagined myself a little like an earnest young Soviet researcher of the 1970s who began digging into the musty files of long-forgotten Kremlin archives and made some stunning discoveries. Trotsky was apparently not the notorious Nazi spy and traitor portrayed in all the textbooks, but instead had been the right-hand man of the sainted Lenin himself during the glorious days of the great Bolshevik Revolution, and for some years afterward had remained in the topmost ranks of the Party elite. And who were these other figures—Zinoviev, Kamenev, Bukharin, Rykov—who also spent those early years at the very top of the Communist hierarchy? In history courses, they had barely rated a few mentions, as minor Capitalist agents who were quickly unmasked and paid for their treachery with their lives. How could the great Lenin, father of the Revolution, have been such an idiot to have surrounded himself almost exclusively with traitors and spies?
>
> But unlike their Stalinist analogs from a couple of years earlier, the American victims who disappeared around 1940 were neither shot nor Gulaged, but merely excluded from the mainstream media that defines our reality, thereby being blotted out from our memory so that future generations gradually forgot that they had ever lived.

A leading example of such a “disappeared” American was journalist John T. Flynn, probably almost unknown today but whose stature had once been enormous. As I wrote last year:

> So imagine my surprise at discovering that throughout the 1930s he had been one of the single most influential *liberal* voices in American society, a writer on economics and politics whose status may have roughly approximated that of Paul Krugman, though with a strong muck-raking tinge. His weekly column in *The New Republic* allowed him to serve as a lodestar for America's progressive elites, while his regular appearances in *Colliers*, an illustrated mass circulation weekly reaching many millions of Americans, provided him a platform comparable to that of an major television personality in the later heyday of network TV.
>
> To some extent, Flynn's prominence may be objectively quantified. A few years ago, I happened to mention his name to a well-read and committed liberal born in the 1930s, and she unsurprisingly drew a complete blank, but wondered if he might have been a little like Walter Lippmann, the very famous columnist of that era. When I checked, I saw that across the hundreds of periodicals in my archiving system, there were just 23 articles by Lippmann from the 1930s but fully 489 by Flynn.

An even stronger American parallel to Taylor was that of historian Harry Elmer Barnes, a figure almost unknown to me, but in his day an academic of great influence and stature:

> Imagine my shock at later discovering that Barnes had actually been one of the most frequent early contributors to *Foreign Affairs*, serving as a primary book reviewer for that venerable publication from its 1922 founding onward, while his stature as one of America's premier liberal academics was indicated by his scores of appearances in *The Nation* and *The New Republic* throughout that decade. Indeed, he is credited with having played a central role in ﷺrevisingﷺ the history of the First World War so as to remove the cartoonish picture of unspeakable German wickedness left behind as a legacy of the dishonest wartime propaganda produced by the opposing British and American governments. And his professional stature was demonstrated by his thirty-five or more books, many of them influential academic volumes, along with his numerous articles in *The American Historical Review*, *Political Science Quarterly*, and other leading

journals.

A few years ago I happened to mention Barnes to an eminent American academic scholar whose general focus in political science and foreign policy was quite similar, and yet the name meant nothing. By the end of the 1930s, Barnes had become a leading critic of America's proposed involvement in World War II, and was permanently ﷺdisappearedﷺ as a consequence, barred from all mainstream media outlets, while a major newspaper chain was heavily pressured into abruptly terminating his long-running syndicated national column in May 1940.

Many of Barnes' friends and allies fell in the same ideological purge, which he described in his own writings and which continued after the end of the war:

Over a dozen years after his disappearance from our national media, Barnes managed to publish *Perpetual War for Perpetual Peace*, a lengthy collection of essays by scholars and other experts discussing the circumstances surrounding America's entrance into World War II, and have it produced and distributed by a small printer in Idaho. His own contribution was a 30,000 word essay entitled ﷺRevisionism and the Historical Blackoutﷺ and discussed the tremendous obstacles faced by the dissident thinkers of that period.

The book itself was dedicated to the memory of his friend, historian Charles A. Beard. Since the early years of the 20th century, Beard had ranked as an intellectual figure of the greatest stature and influence, co-founder of The New School in New York and serving terms as president of both The American Historical Association and The American Political Science Association. As a leading supporter of the New Deal economic policies, he was overwhelmingly lauded for his views.

Yet once he turned against Roosevelt's bellicose foreign policy, publishers shut their doors to him, and only his personal friendship with the head of the Yale University Press allowed his critical 1948 volume *President Roosevelt and the Coming of the War, 1941* to even appear in print. Beard's stellar reputation seems to have begun a rapid decline from that point onward, so that by 1968 historian Richard Hofstadter could write: ﷺToday Beard's reputation stands like an imposing ruin in the landscape of American historiography. What was once the grandest house in the province is now a ravaged survivalﷺ. Indeed, Beard's once-

dominant "economic interpretation of history" might these days almost be dismissed as promoting "dangerous conspiracy theories," and I suspect few non-historians have even heard of him.

Another major contributor to the Barnes volume was William Henry Chamberlin, who for decades had been ranked among America's leading foreign policy journalists, with more than 15 books to his credit, most of them widely and favorably reviewed. Yet *America's Second Crusade*, his critical 1950 analysis of America's entry into World War II, failed to find a mainstream publisher, and when it did appear was widely ignored by reviewers. Prior to its publication, his byline had regularly run in our most influential national magazines such as *The Atlantic Monthly* and *Harpers*. But afterward, his writing was almost entirely confined to small circulation newsletters and periodicals, appealing to narrow conservative or libertarian audiences.

In these days of the Internet, anyone can easily establish a website to publish his views, thus making them immediately available to everyone in the world. Social media outlets such as Facebook and Twitter can bring interesting or controversial material to the attention of millions with just a couple of mouse-clicks, completely bypassing the need for the support of establishmentarian intermediaries. It is easy for us to forget just how extremely challenging the dissemination of dissenting ideas remained back in the days of print, paper, and ink, and recognize that an individual purged from his regular outlet might require many years to regain any significant foothold for the distribution of his work.

- American Pravda: Our Great Purge of the 1940s
  Ron Unz • June 11, 2018 • 5,400 Words

British writers had faced similar ideological perils years before A.J.P. Taylor ventured into those troubled waters, as a distinguished British naval historian discovered in 1953:

The author of *Unconditional Hatred* was Captain Russell Grenfell, a British naval officer who had served with distinction in the First World War, and later helped direct the Royal Navy Staff College, while publishing six highly-regarded books on naval strategy and serving as the Naval Correspondent of the *Daily Telegraph*.

Grenfell recognized that great quantities of extreme propaganda almost inevitably accompany any major war, but with several years having passed since the close of hostilities, he was growing concerned that unless an antidote were soon widely applied, the lingering poison of such wartime exaggerations might threaten the future peace of Europe.

His considerable historical erudition and his reserved academic tone shine through in this fascinating volume, which focuses primarily upon the events of the two world wars, but often contains digressions into the Napoleonic conflicts or even earlier ones. One of the intriguing aspects of his discussion is that much of the anti-German propaganda he seeks to debunk would today be considered so absurd and ridiculous it has been almost entirely forgotten, while much of the extremely hostile picture we currently have of Hitler's Germany receives almost no mention whatsoever, possibly because it had not yet been established or was then still considered too outlandish for anyone to take seriously. Among other matters, he reports with considerable disapproval that leading British newspapers had carried headlined articles about the horrific tortures that were being inflicted upon German prisoners at war crimes trials in order to coerce all sorts of dubious confessions out of them.

Some of Grenfell's casual claims do raise doubts about various aspects of our conventional picture of German occupation policies. He notes numerous stories in the British press of former French "slave-laborers" who later organized friendly post-war reunions with their erstwhile German employers. He also states that in 1940 those same British papers had reported the absolutely exemplary behavior of German soldiers toward French civilians, though after terroristic attacks by Communist underground forces provoked reprisals, relations often grew much worse.

Most importantly, he points out that the huge Allied strategic bombing campaign against French cities and industry had killed huge numbers of civilians, probably far more than had ever died at German hands, and thereby provoked a great deal of hatred as an inevitable consequence. At Normandy he and other British officers had been warned to remain very cautious among any French civilians they encountered for fear they might be subject to deadly attacks.

Although Grenfell's content and tone strike me as exceptionally

> even-handed and objective, others surely viewed his text in a very different light. The Devin-Adair jacket-flap notes that no British publisher was willing to accept the manuscript, and when the book appeared no major American reviewer recognized its existence. Even more ominously, Grenfell is described as having been hard at work on a sequel when he suddenly died in 1954 of unknown causes, and his lengthy obituary in the *London Times* gives his age as 62.

Another top contemporary observer from that era provides a portrayal of France during World War II that is diametrically opposed to that of today's widely-accepted narrative:

> On French matters, Grenfell provides several extended references to a 1952 book entitled *France: The Tragic Years, 1939-1947* by Sisley Huddleston, an author totally unfamiliar to me, and this whet my curiosity. One helpful use of my content-archiving system is to easily provide the proper context for long-forgotten writers, and Huddleston's scores of appearances in *The Atlantic Monthly*, *The Nation*, and *The New Republic*, plus his thirty well-regarded books on France, seem to confirm that he spent decades as one of the leading interpreters of France to educated American and British readers. Indeed, his exclusive interview with British Prime Minister Lloyd George at the Paris Peace Conference became an international scoop. As with so many other writers, after World War II his American publisher necessarily became Devin-Adair, which released a posthumous 1955 edition of his book. Given his eminent journalistic credentials, Huddleston's work on the Vichy period was reviewed in American periodicals, although in rather cursory and dismissive fashion, and I ordered a copy and read it.
>
> I cannot attest to the correctness of Huddleston's 350 page account of France during the war years and immediately after, but as a very distinguished journalist and longtime observer who was an eyewitness to the events he describes, writing at a time when the official historical narrative had not yet hardened into concrete, I do think that his views should be taken quite seriously. Huddleston's personal circle certainly extended quite high, with former U.S. Ambassador William Bullitt being one of his oldest friends. And without doubt Huddleston's presentation is radically different from the conventional story I had always heard.
>
> As Huddleston describes things, the French army collapsed in May of 1940, and the government desperately recalled Petain, then in

his mid-80s and the country's greatest war hero, from his posting as the Ambassador to Spain. Soon he was asked by the French President to form a new government and arrange an armistice with the victorious Germans, and this proposal received near-unanimous support from France's National Assembly and Senate, including the backing of virtually all the leftist parliamentarians. Petain achieved this result, and another near-unanimous vote of the French parliament then authorized him to negotiate a full peace treaty with Germany, which certainly placed his political actions on the strongest possible legal basis. At that point, almost everyone in Europe believed that the war was essentially over, with Britain soon to make peace.

While Petain's fully-legitimate French government was negotiating with Germany, a small number of diehards, including Col. Charles de Gaulle, deserted from the army and fled abroad, declaring that they intended to continue the war indefinitely, but they initially attracted minimal support or attention. One interesting aspect of the situation was that De Gaulle had long been one of Petain's leading proteges, and once his political profile began rising a couple of years later, there were often quiet speculations that he and his old mentor had arranged a "division of labor," with the one making an official peace with the Germans while the other left to become the center of overseas resistance in the uncertain event that different opportunities arose.

Although Petain's new French government guaranteed that its powerful navy would never be used against the British, Churchill took no chances, and quickly launched an attack on the fleet of his erstwhile ally, whose ships were already disarmed and helplessly moored in port, sinking most of them, and killing up to 2,000 Frenchmen in the process. This incident was not entirely dissimilar to the Japanese attack on Pearl Harbor the following year, and rankled the French for many years to come.

Huddleston then spends much of the book discussing the complex French politics of the next few years, as the war unexpectedly continued, with Russia and America eventually joining the Allied cause, greatly raising the odds against a German victory. During this period, the French political and military leadership performed a difficult balancing act, resisting German demands on some points and acquiescing on others, while the internal Resistance movement gradually grew, attacking German soldiers and provoking harsh German reprisals. Given my lack of

expertise, I cannot really judge the accuracy of his political narrative, but it seems quite realistic and plausible to me, though specialists might surely find fault.

However, the most remarkable claims in Huddleston's book come towards the end, as he describes what eventually became known as "the Liberation of France" during 1944-45 when the retreating German forces abandoned the country and pulled back to their own borders. Among other things, he suggests that the number of Frenchmen claiming "Resistance" credentials grew as much as a hundred-fold once the Germans had left and there was no longer any risk in adopting that position.

And at that point, enormous bloodshed soon began, by far the worst wave of extra-judicial killings in all of French history. Most historians agree that around 20,000 lives were lost in the notorious "Reign of Terror" during the French Revolution and perhaps 18,000 died during the Paris Commune of 1870-71 and its brutal suppression. But according to Huddleston the American leaders estimated there were at least 80,000 "summary executions" in just the first few months after Liberation, while the Socialist Deputy who served as Interior Minister in March 1945 and would have been in the best position to know, informed De Gaulle's representatives that 105,000 killings had taken place just from August 1944 to March 1945, a figure that was widely quoted in public circles at the time.

Since a large fraction of the entire French population had spent years behaving in ways that now suddenly might be considered "collaborationist," enormous numbers of people were vulnerable, even at risk of death, and they sometimes sought to save their own lives by denouncing their acquaintances or neighbors. Underground Communists had long been a major element of the Resistance, and many of them eagerly retaliated against their hated "class enemies," while numerous individuals took the opportunity to settle private scores. Another factor was that many of the Communists who had fought in the Spanish Civil War, including thousands of the members of the International Brigades, had fled to France after their military defeat in 1938, and now often took the lead in enacting vengeance against the same sort of conservative forces who had previously vanquished them in their own country.

Although Huddleston himself was an elderly, quite distinguished international journalist with very highly placed American friends,

> and he had performed some minor services on behalf of the Resistance leadership, he and his wife narrowly escaped summary execution during that period, and he provides a collection of the numerous stories he heard of less fortunate victims. But what appears to have been by far the worst sectarian bloodshed in French history has been soothingly rechristened "the Liberation" and almost entirely removed from our historical memory, except for the famously shaved heads of a few disgraced women. These days Wikipedia constitutes the congealed distillation of our Official Truth, and its entry on those events puts the death toll at barely one-tenth the figures quoted by Huddleston, but I find him a far more credible source.

We may easily imagine that some prominent and highly-regarded individual at the peak of his career and public influence might suddenly take leave of his senses and begin promoting eccentric and erroneous theories, thereby ensuring his downfall. Under such circumstances, his claims may be treated with great skepticism and perhaps simply disregarded.

But when the number of such very reputable yet contrary voices becomes sufficiently large and the claims they make seem generally consistent with each other, we can no longer casually dismiss their critiques. Their committed stance on these controversial matters had proved fatal to their continued public standing, and although they must have recognized these likely consequences, they nonetheless followed that path, even going to the trouble of writing lengthy books presenting their views, and seeking out some publisher somewhere who was willing to release these.

John T. Flynn, Harry Elmer Barnes, Charles Beard, William Henry Chamberlin, Russell Grenfell, Sisley Huddleston, and numerous other scholars and journalists of the highest caliber and reputation all told a rather consistent story of the Second World War but one at total variance with that of today's established narrative, and they did so at the cost of destroying their careers. A decade or two later, renowned historian A.J.P. Taylor reaffirmed this same basic narrative, and was purged from Oxford as a consequence. I find it very difficult to explain the behavior of all these individuals unless they were presenting a truthful account.

If a ruling political establishment and its media organs offer lavish rewards of funding, promotion, and public acclaim to those who endorse its party-line propaganda while casting into outer darkness those who dissent, the pronouncements of the former should be

viewed with considerable suspicion. Barnes popularized the phrase "court historians" to describe those disingenuous and opportunistic individuals who follow the prevailing political winds, and our present-day media outlets are certainly replete with such types.

A climate of serious intellectual repression greatly complicates our ability to uncover the events of the past. Under normal circumstances, competing claims can be weighed in the give-and-take of public or scholarly debate, but this obviously becomes impossible if the subjects being discussed are forbidden ones. Moreover, writers of history are human beings, and if they have been purged from their prestigious positions, blacklisted from public venues, and even cast into poverty, we should hardly be surprised if they sometimes grow angry and bitter at their fate, perhaps reacting in ways that their enemies may later use to attack their credibility.

A.J.P. Taylor lost his Oxford post for publishing his honest analysis of the origins of World War II, but his enormous previous stature and the widespread acclaim his book had received seemed to protect him from further damage, and the work itself soon became recognized as a great classic, remaining permanently in print and later gracing the required reading lists of our most elite universities. However, others who delved into those same troubled waters were much less fortunate.

The same year that Taylor's book appeared so did a work covering much the same ground by a fledgling scholar named David L. Hoggan. Hoggan had earned his 1948 Ph.D. in diplomatic history at Harvard under Prof. William Langer, one of the towering figures in that field, and his maiden work *The Forced War* was a direct outgrowth of his doctoral dissertation. While Taylor's book was fairly short and mostly based upon public sources and some British documents, Hoggan's volume was exceptionally long and detailed, running nearly 350,000 words including references, and drew upon his many years of painstaking research in the newly available governmental archives of Poland and Germany. Although the two historians were fully in accord that Hitler had certainly not intended the outbreak of World War II, Hoggan argued that various powerful individuals within the British government had deliberately worked to provoke the conflict, thereby forcing the war upon Hitler's Germany just as his title suggested.

Given the highly controversial nature of Hoggan's conclusions and his lack of previous scholarly accomplishments, his huge work only

appeared in a German edition, where it quickly became a hotly-debated bestseller in that language. As a junior academic, Hoggan was quite vulnerable to the enormous pressure and opprobrium he surely must have faced. He seems to have quarreled with Barnes, his revisionist mentor, while his hopes of arranging an English language edition via a small American publisher soon dissipated. Perhaps as a consequence, the embattled young scholar later suffered a series of nervous breakdowns, and by the end of the 1960s he had resigned his position at San Francisco State College, the last serious academic position he was ever to hold. He subsequently earned his living as a research fellow at a small libertarian thinktank, then after it folded taught at a local junior college, hardly the expected professional trajectory of someone who had begun with such auspicious Harvard credentials.

In 1984 an English version of his major work was finally about to be released when the facilities of its small revisionist publisher in the Los Angeles area were fire-bombed and totally destroyed by Jewish militants, thus obliterating the plates and all existing stock. Living in total obscurity, Hoggan himself died of a heart-attack in 1988, aged 65, and the following year an English version of his work finally appeared, nearly three decades after originally written, with the scarce surviving copies today being extremely rare and costly. However, a PDF version lacking all footnotes is available on the Internet, and I have now added Hoggan's volume to my collection of HTML Books, finally making it conveniently available to a broader audience almost six decades after it was completed.

- The Forced War
  *When Peaceful Revisionism Failed*
  David L. Hoggan • 1989 • 320,000 Words

I only recently discovered Hoggan's opus, and found it exceptionally detailed and comprehensive, though rather dry. I read through the first hundred pages or so, plus a few selections here and there, just a small portion of the 700 pages, but enough to develop a sense of the material.

The short 1989 introduction by the publisher characterizes it as a uniquely comprehensive treatment of the ideological and diplomatic circumstances surrounding the outbreak of the war, and that seems an accurate appraisal, one which may even still hold true today. For example, the first chapter provides a remarkably detailed description of the several conflicting ideological currents of Polish nationalism during the century or so prior to 1939, a very specialized topic that I

had never encountered anywhere else nor found of great interest.

Despite its long suppression, under many circumstances such an exhaustive work based upon many years of archival research might constitute the scholarly foundation for subsequent historians, and indeed various recent revisionist authors have relied upon Hoggan in exactly that manner. But unfortunately there are some serious concerns. Just as we might expect, the overwhelming majority of the discussion of Hoggan found on the Internet is hostile and insulting, and for obvious reasons this might normally be dismissed. However, Gary North, himself a prominent revisionist who personally knew Hoggan, has been equally critical, portraying him as biased, factually unreliable, and even dishonest.

My own sense is that the overwhelming majority of Hoggan's material is likely correct and accurate, though we might dispute his interpretations. However, given such serious accusations, we should probably treat all his claims with some caution, especially since it would take considerable archival investigation to verify most of his specific research findings. Indeed, since so much of Hoggan's overall framework of events matches that of Taylor, I think we are far better off generally relying upon the latter.

## The Landmark Historiography of David Irving

Fortunately, these same concerns about accuracy can be entirely dismissed in the case of a far more important writer, and one whose voluminous output easily eclipses that of Hoggan or almost any other historian of World War II. As I described David Irving last year:

> With many millions of his books in print, including a string of best-sellers translated into numerous languages, it's quite possible that the eighty-year-old Irving today ranks as the most internationally-successful British historian of the last one hundred years. Although I myself have merely read a couple of his shorter works, I found these absolutely outstanding, with Irving regularly deploying his remarkable command of the primary source documentary evidence to totally demolish my naive History 101 understanding of major historical events. It would hardly surprise me if the huge corpus of his writings eventually constitutes a central pillar upon which future historians seek to comprehend the catastrophically bloody middle years of our hugely destructive

twentieth century even after most of our other chroniclers of that era are long forgotten.

When confronted with astonishing claims that completely overturn an established historical narrative, considerable skepticism is warranted, and my own lack of specialized expertise in World War II history left me especially cautious. The documents Irving unearths seemingly portray a Winston Churchill so radically different from that of my naive understanding as to be almost unrecognizable, and this naturally raised the question of whether I could credit the accuracy of Irving's evidence and his interpretation. All his material is massively footnoted, referencing copious documents in numerous official archives, but how could I possibly muster the time or energy to verify them?

Rather ironically, an extremely unfortunate turn of events seems to have fully resolved that crucial question.

Irving is an individual of uncommonly strong scholarly integrity, and as such he is unable to see things in the record that do not exist, even if it were in his considerable interest to do so, nor to fabricate non-existent evidence. Therefore, his unwillingness to dissemble or pay lip-service to various widely-worshiped cultural totems eventually provoked an outpouring of vilification by a swarm of ideological fanatics drawn from a particular ethnic persuasion. This situation was rather similar to the troubles my old Harvard professor E.O. Wilson had experienced around that same time upon publication of his own masterwork *Sociobiology: The New Synthesis*, the book that helped launch the field of modern human evolutionary psychobiology.

These zealous ethnic-activists began a coordinated campaign to pressure Irving's prestigious publishers into dropping his books, while also disrupting his frequent international speaking tours and even lobbying countries to bar him from entry. They also maintained a drumbeat of media vilification, continually blackening his name and his research skills, even going so far as to denounce him as a &#65533;Nazi&#65533; and a &#65533;Hitler-lover,&#65533; just as had similarly been done in the case of Prof. Wilson.

During the 1980s and 1990s, these determined efforts, sometimes backed by considerable physical violence, increasingly bore fruit, and Irving's career was severely impacted. He had once been feted by the world's leading publishing houses and his books serialized and reviewed in Britain's most august newspapers; now he

gradually became a marginalized figure, almost a pariah, with enormous damage to his sources of income.

In 1993, Deborah Lipstadt, a rather ignorant and fanatic professor of Theology and Holocaust Studies (or perhaps ﷺHolocaust Theologyﷺ) ferociously attacked him in her book as being a ﷺHolocaust Denier,ﷺ leading Irving's timorous publisher to suddenly cancel the contract for his major new historical volume. This development eventually sparked a rancorous lawsuit in 1998, which resulted in a celebrated 2000 libel trial held in British Court.

That legal battle was certainly a David-and-Goliath affair, with wealthy Jewish movie producers and corporate executives providing a huge war-chest of $13 million to Lipstadt's side, allowing her to fund a veritable army of 40 researchers and legal experts, captained by one of Britain's most successful Jewish divorce lawyers. By contrast, Irving, being an impecunious historian, was forced to defend himself without benefit of legal counsel.

In real life unlike in fable, the Goliaths of this world are almost invariably triumphant, and this case was no exception, with Irving being driven into personal bankruptcy, resulting in the loss of his fine central London home. But seen from the longer perspective of history, I think the victory of his tormenters was a remarkably Pyrrhic one.

Although the target of their unleashed hatred was Irving's alleged ﷺHolocaust denial,ﷺ as near as I can tell, that particular topic was almost entirely absent from all of Irving's dozens of books, and exactly that very silence was what had provoked their spittle-flecked outrage. Therefore, lacking such a clear target, their lavishly-funded corps of researchers and fact-checkers instead spent a year or more apparently performing a line-by-line and footnote-by-footnote review of everything Irving had ever published, seeking to locate every single historical error that could possibly cast him in a bad professional light. With almost limitless money and manpower, they even utilized the process of legal discovery to subpoena and read the thousands of pages in his bound personal diaries and correspondence, thereby hoping to find some evidence of his ﷺwicked thoughts.ﷺ *Denial*, a 2016 Hollywood film co-written by Lipstadt, may provide a reasonable outline of the sequence of events as seen from her perspective.

Yet despite such massive financial and human resources, they apparently came up almost entirely empty, at least if Lipstadt's triumphalist 2005 book *History on Trial* may be credited. Across four decades of research and writing, which had produced numerous controversial historical claims of the most astonishing nature, they only managed to find a couple of dozen rather minor alleged errors of fact or interpretation, most of these ambiguous or disputed. And the worst they discovered after reading every page of the many linear meters of Irving's personal diaries was that he had once composed a short "racially insensitive" ditty for his infant daughter, a trivial item which they naturally then trumpeted as proof that he was a "racist." Thus, they seemingly admitted that Irving's enormous corpus of historical texts was perhaps 99.9% accurate.

I think this silence of "the dog that didn't bark" echoes with thunderclap volume. I'm not aware of any other academic scholar in the entire history of the world who has had all his decades of lifetime work subjected to such painstakingly exhaustive hostile scrutiny. And since Irving apparently passed that test with such flying colors, I think we can regard almost every astonishing claim in all of his books—as recapitulated in his videos—as absolutely accurate.

- The Remarkable Historiography of David Irving
  Ron Unz • June 4, 2018 • 1,700 Words

A few years ago I had read two of Irving's shorter works, *Nuremberg: The Last Battle* and *The War Path*, the latter discussing the events leading to the outbreak of the conflict and therefore mostly overlapping with Taylor's history. Irving's analysis seems quite similar to that of his eminent Oxford predecessor, while providing a wealth of meticulous documentary evidence to support that simple story first outlined two decades earlier. This concurrence hardly surprised me since multiple efforts to accurately describe the same historical reality are likely to be reasonably congruent, whereas dishonest propaganda may widely diverge in all sorts of different directions.

[image]

I recently decided to tackle one of Irving's much longer works, the first volume of *Churchill's War*, a classic text that runs some 300,000

words and covers the story of the legendary British prime minister to the eve of Barbarossa, and I found it just as outstanding as I had expected.

As one small indicator of Irving's candor and knowledge, he repeatedly if briefly refers to the 1940 Allied plans to suddenly attack the USSR and destroy its Baku oilfields, an utterly disastrous proposal that surely would have lost the war if actually carried out. By contrast, the exceptionally embarrassing facts of Operation Pike have been totally excluded from virtually all later Western accounts of the conflict, leaving one to wonder which of our numerous professional historians are merely ignorant and which are guilty of lying by omission.

Until recently, my familiarity with Churchill had been rather cursory, and Irving's revelations were absolutely eye-opening. Perhaps the most striking single discovery was the remarkable venality and corruption of the man, with Churchill being a huge spendthrift who lived lavishly and often far beyond his financial means, employing an army of dozens of personal servants at his large country estate despite frequently lacking any regular and assured sources of income to maintain them. This predicament naturally put him at the mercy of those individuals willing to support his sumptuous lifestyle in exchange for determining his political activities. And somewhat similar pecuniary means were used to secure the backing of a network of other political figures from across all the British parties, who became Churchill's close political allies.

To put things in plain language, during the years leading up to the Second World War, both Churchill and numerous other fellow British MPs were regularly receiving sizable financial stipends—cash bribes—from Jewish and Czech sources in exchange for promoting a policy of extreme hostility toward the German government and actually advocating war. The sums involved were quite considerable, with the Czech government alone probably making payments that amounted to tens of millions of dollars in present-day money to British elected officials, publishers, and journalists working to overturn the official peace policy of their existing government. A particularly notable instance occurred in early 1938 when Churchill suddenly lost all his accumulated wealth in a foolish gamble on the American stock-market, and was soon forced to put his beloved country estate up for sale to avoid personal bankruptcy, only to quickly be bailed out by a foreign Jewish millionaire intent upon promoting a war against Germany. Indeed, the early stages of Churchill's involvement in this sordid behavior are recounted in an Irving chapter aptly entitled "The

Hired Help."

Ironically enough, German Intelligence learned of this massive bribery of British parliamentarians, and passed the information along to Prime Minister Neville Chamberlain, who was horrified to discover the corrupt motives of his fierce political opponents, but apparently remained too much of a gentlemen to have them arrested and prosecuted. I'm no expert in the British laws of that era, but for elected officials to do the bidding of foreigners on matters of war and peace in exchange for huge secret payments seems almost a textbook example of treason to me, and I think that Churchill's timely execution would surely have saved tens of millions of lives.

My impression is that individuals of low personal character are those most likely to sell out the interests of their own country in exchange for large sums of foreign money, and as such usually constitute the natural targets of nefarious plotters and foreign spies. Churchill certainly seems to fall into this category, with rumors of massive personal corruption swirling around him from early in his political career. Later, he supplemented his income by engaging in widespread art-forgery, a fact that Roosevelt later discovered and probably used as a point of personal leverage against him. Also quite serious was Churchill's constant state of drunkenness, with his inebriation being so widespread as to constitute clinical alcoholism. Indeed, Irving notes that in his private conversations FDR routinely referred to Churchill as "a drunken bum."

During the late 1930s, Churchill and his clique of similarly bought-and-paid-for political allies had endlessly attacked and denounced Chamberlain's government for its peace policy, and he regularly made the wildest sort of unsubstantiated accusations, claiming the Germans were undertaking a huge military build-up aimed against Britain. Such roiling charges were often widely echoed by a media heavily influenced by Jewish interests and did much to poison the state of German-British relations. Eventually, these accumulated pressures forced Chamberlain into the extremely unwise act of providing an unconditional guarantee of military backing to Poland's irresponsible dictatorship. As a result, the Poles then rather arrogantly refused any border negotiations with Germany, thereby lighting the fuse which eventually led to the German invasion six months later and the subsequent British declaration of war. The British media had widely promoted Churchill as the leading pro-war political figure, and once Chamberlain was forced to create a wartime government of national

unity, his leading critic was brought into it and given the naval affairs portfolio.

Following his lightening six-week defeat of Poland, Hitler unsuccessfully sought to make peace with the Allies, and the war went into abeyance. Then in early 1940, Churchill persuaded his government to try strategically outflanking the Germans by preparing a large sea-borne invasion of neutral Norway; but Hitler discovered the plan and preempted the attack, with Churchill's severe operational mistakes leading to a surprising defeat for the vastly superior British forces. During World War I, Churchill's Gallipoli disaster had forced his resignation from the British Cabinet, but this time the friendly media helped ensure that all the blame for the somewhat similar debacle at Narvik was foisted upon Chamberlain, so it was the latter who was forced to resign, with Churchill then replacing him as prime minister. British naval officers were appalled that the primary architect of their humiliation had become its leading political beneficiary, but reality is what the media reports, and the British public never discovered this great irony.

This incident was merely the first of the long series of Churchill's major military failures and outright betrayals that are persuasively recounted by Irving, nearly all of which were subsequently airbrushed out of our hagiographic histories of the conflict. We should recognize that wartime leaders who spend much of their time in a state of drunken stupor are far less likely to make optimal decisions, especially if they are as extremely prone to military micro-management as was the case with Churchill.

In the spring of 1940, the Germans launched their sudden armored thrust into France via Belgium, and as the attack began to succeed, Churchill ordered the commanding British general to immediately flee with his forces to the coast and to do so without informing his French or Belgium counterparts of the huge gap he was thereby opening in the Allied front-lines, thus ensuring the encirclement and destruction of their armies. Following France's resulting defeat and occupation, the British prime minister then ordered a sudden, surprise attack on the disarmed French fleet, completely destroying it and killing some 2,000 of his erstwhile allies; the immediate cause was his mistranslation of a single French word, but this "Pearl Harbor-type" incident continued to rankle French leaders for decades.

Hitler had always wanted friendly relations with Britain and certainly had sought to avoid the war that had been forced upon him. With France now defeated and British forces driven from the Continent, he

therefore offered very magnanimous peace terms and a new German alliance to Britain. The British government had been pressured into entering the war for no logical reason and against its own national interests, so Chamberlain and half the Cabinet naturally supported commencing peace negotiations, and the German proposal probably would have received overwhelming approval both from the British public and political elites if they had ever been informed of its terms.

But despite some occasional wavering, Churchill remained absolutely adamant that the war must continue, and Irving plausibly argues that his motive was an intensely personal one. Across his long career, Churchill had had a remarkable record of repeated failure, and for him to have finally achieved his lifelong ambition of becoming prime minister only to lose a major war just weeks after reaching Number 10 Downing Street would have ensured that his permanent place in history was an extremely humiliating one. On the other hand, if he managed to continue the war, perhaps the situation might somehow later improve, especially if the Americans could be persuaded to eventually enter the conflict on the British side.

Since ending the war with Germany was in his nation's interest but not his own, Churchill undertook ruthless means to prevent peace sentiments from growing so strong that they overwhelmed his opposition. Along with most other major countries, Britain and Germany had signed international conventions prohibiting the aerial bombardment of civilian urban targets, and although the British leader had very much hoped the Germans would attack his cities, Hitler scrupulously followed these provisions. In desperation, Churchill therefore ordered a series of large-scale bombing raids against the German capital of Berlin, doing considerable damage, and after numerous severe warnings, Hitler finally began to retaliate with similar attacks against British cities. The population saw the heavy destruction inflicted by these German bombing raids and was never informed of the British attacks that had preceded and provoked them, so public sentiment greatly hardened against making peace with the seemingly diabolical German adversary.

In his memoirs published a half-century later, Prof. Revilo P. Oliver, who had held a senior wartime role in American Military Intelligence, described this sequence of events in very bitter terms:

> Great Britain, in violation of all the ethics of civilized warfare that had theretofore been respected by our race, and in treacherous violation of solemnly assumed diplomatic covenants about "open cities", had secretly carried out intensive bombing of such open

> cities in Germany for the express purpose of killing enough unarmed and defenceless men and women to force the German government reluctantly to retaliate and bomb British cities and thus kill enough helpless British men, women, and children to generate among Englishmen enthusiasm for the insane war to which their government had committed them.
>
> It is impossible to imagine a governmental act more vile and more depraved than contriving death and suffering for its own people — for the very citizens whom it was exhorting to loyalty — and I suspect that an act of such infamous and savage treason would have nauseated even Genghis Khan or Hulagu or Tamerlane, Oriental barbarians universally reprobated for their insane blood-lust. History, so far as I recall, does not record that they ever butchered their own women and children to facilitate lying propaganda….In 1944 members of British Military Intelligence took it for granted that after the war Marshal Sir Arthur Harris would be hanged or shot for high treason against the British people…

Churchill's ruthless violation of the laws of war regarding urban aerial bombardment directly led to the destruction of many of Europe's finest and most ancient cities. But perhaps influenced by his chronic drunkenness, he later sought to carry out even more horrifying war crimes and was only prevented from doing so by the dogged opposition of all his military and political subordinates.

Along with the laws prohibiting the bombing of cities, all nations had similarly agreed to ban the first use of poison gas, while stockpiling quantities for necessary retaliation. Since Germany was the world-leader in chemistry, the Nazis had produced the most lethal forms of new nerve gases, such as Tabun and Sarin, whose use might have easily resulted in major military victories on both the Eastern and Western fronts, but Hitler had scrupulously obeyed the international protocols that his nation had signed. However, late in the war during 1944 the relentless Allied bombardment of German cities led to the devastating retaliatory attacks of the V-1 flying bombs against London, and an outraged Churchill became adamant that German cities should be attacked with poison gas in counter-retaliation. If Churchill had gotten his way, many millions of British might soon have perished from German nerve gas counter-strikes. Around the same time, Churchill was also blocked in his proposal to bombard Germany with hundreds of thousands of deadly anthrax bombs, an operation that might have rendered much of Central and Western Europe uninhabitable for generations.

I found Irving's revelations on all these matters absolutely astonishing, and was deeply grateful that Deborah Lipstadt and her army of diligent researchers had carefully investigated and seemingly confirmed the accuracy of virtually every single item.

The two existing volumes of Irving's Churchill masterwork total well over 700,000 words, and reading them would obviously consume weeks of dedicated effort.  Fortunately, Irving is also a riveting speaker and several of his extended lectures on the topic are available for viewing on BitChute after having been recently purged from YouTube:

# The True Origins of the Second World War

I very recently reread Pat Buchanan's 2008 book harshly condemning Churchill for his role in the cataclysmic world war and made an interesting discovery. Irving is surely among the most authoritative Churchill biographers, with his exhaustive documentary research being the source of so many new discoveries and his books selling in the millions. Yet Irving's name never once appears either in Buchanan's text or in his bibliography, though we may suspect that much of Irving's material has been "laundered" through other, secondary Buchanan sources. Buchanan extensively cites A.J.P. Taylor, but makes no mention of Barnes, Flynn, or various other leading American academics and journalists who were purged for expressing contemporaneous views not so dissimilar from those of the author himself.

During the 1990s, Buchanan had ranked as one of America's most prominent political figures, having an enormous media footprint in both print and television, and with his remarkably strong insurgent runs for the Republican presidential nomination in 1992 and 1996 cementing his national stature. But his numerous ideological foes worked tirelessly to undermine him, and by 2008 his continued presence as a pundit on the MSNBC cable channel was one of his last remaining footholds of major public prominence. He probably recognized that publishing a revisionist history of World War II might endanger his position, and believed that any direct association with purged and vilified figures such as Irving or Barnes would surely lead to his permanent banishment from all electronic media.

A decade ago I had been quite impressed by Buchanan's history, but I had subsequently done a great deal of reading on that era and I found myself somewhat disappointed the second time through. Aside from its often breezy, rhetorical, and unscholarly tone, my sharpest criticisms were not with the controversial positions that he took, but with the other controversial topics and questions that he so carefully avoided.

Perhaps the most obvious of these is the question of the true origins of the war, which laid waste to much of Europe, killed perhaps fifty or sixty million, and gave rise to the subsequent Cold War era in which Communist regimes controlled half of the entire Eurasian world-continent. Taylor, Irving, and numerous others have thoroughly debunked the ridiculous mythology that the cause lay in Hitler's mad desire for world conquest, but if the German dictator clearly bore only

minor responsibility, was there indeed any true culprit? Or did this massively-destructive world war come about in somewhat similar fashion to its predecessor, which our conventional histories treat as mostly due to a collection of blunders, misunderstandings, and thoughtless escalations.

During the 1930s, John T. Flynn was one of America's most influential progressive journalists, and although he had begun as a strong supporter of Roosevelt and his New Deal, he gradually became a sharp critic, concluding that FDR's various governmental schemes had failed to revive the American economy. Then in 1937 a new economic collapse spiked unemployment back to the same levels as when the president had first entered office, confirming Flynn in his harsh verdict. And as I wrote last year:

> Indeed, Flynn alleges that by late 1937, FDR had turned towards an aggressive foreign policy aimed at involving the country in a major foreign war, primarily because he believed that this was the only route out of his desperate economic and political box, a stratagem not unknown among national leaders throughout history. In his January 5, 1938 *New Republic* column, he alerted his disbelieving readers to the looming prospect of a large naval military build-up and warfare on the horizon after a top Roosevelt adviser had privately boasted to him that a large bout of "military Keysianism" and a major war would cure the country's seemingly insurmountable economic problems. At that time, war with Japan, possibly over Latin American interests, seemed the intended goal, but developing events in Europe soon persuaded FDR that fomenting a general war against Germany was the best course of action. Memoirs and other historical documents obtained by later researchers seem to generally support Flynn's accusations by indicating that Roosevelt ordered his diplomats to exert enormous pressure upon both the British and Polish governments to avoid any negotiated settlement with Germany, thereby leading to the outbreak of World War II in 1939.

The last point is an important one since the confidential opinions of those closest to important historical events should be accorded considerable evidentiary weight. In a recent article John Wear mustered the numerous contemporaneous assessments that implicated FDR as a pivotal figure in orchestrating the world war by his constant pressure upon the British political leadership, a policy that he privately even admitted could mean his impeachment if revealed. Among other testimony, we have the statements of the Polish and

British ambassadors to Washington and the American ambassador to London, who also passed along the concurring opinion of Prime Minister Chamberlain himself. Indeed, the German capture and publication of secret Polish diplomatic documents in 1939 had already revealed much of this information, and William Henry Chamberlin confirmed their authenticity in his 1950 book. But since the mainstream media never reported any of this information, these facts remain little known even today.

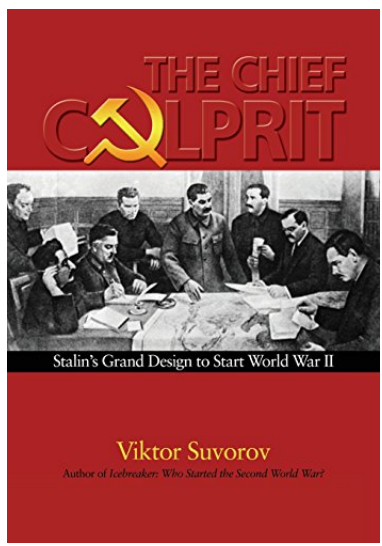
FDR seems to have played the crucial part in orchestrating the outbreak of World War II, greatly assisted by Churchill and his circle in Britain. But during 1939, the growing tensions over Danzig gave Stalin a tremendous strategic opening. Signing a pact with Hitler, the two of them soon jointly invaded Poland, but even as the Soviets seized half the territory, Britain and France declared war only upon Germany. And while Stalin then waited for the other European powers to exhaust each other, he began an offensive military build-up of unprecedented magnitude, soon having far more and better tanks than the rest of the world combined.

As I wrote earlier this year:

> These important considerations become particularly relevant when we attempt to understand the circumstances surrounding *Operation Barbarossa*, Germany's 1941 attack upon the Soviet Union, which constituted the central turning point of the war. Both at the time and during the half-century which followed, Western historians uniformly claimed that the surprise assault had caught an overly-trusting Stalin completely unaware, with Hitler's motive being his dream of creating the huge German land-empire that he had hinted at in the pages of *Mein Kampf*, published sixteen years earlier.
>
> But in 1990 a former Soviet military intelligence officer who had defected to the West and was living in Britain dropped a major bombshell. Writing under the pen-name Viktor Suvorov, he had already published a number of highly-regarded books on the armed forces of the USSR, but in *Icebreaker* he now claimed that his extensive past research in the Soviet archives had revealed that by 1941 Stalin had amassed enormous offensive military forces and positioned them all along the border, preparing to attack and easily overwhelm the greatly outnumbered and outgunned forces of the *Wehrmacht*, quickly conquering all of

Europe.

Then at almost the last moment, Hitler suddenly realized the strategic trap into which he had fallen, and ordered his heavily outnumbered and outgunned troops into a desperate surprise attack of their own on the assembling Soviets, fortuitously catching them at the very point at which their own final preparations for sudden attack had left them most vulnerable, and thereby snatching a major initial victory from the jaws of certain defeat. Huge stockpiles of Soviet ammunition and weaponry had been positioned close to the border to supply the army of invasion into Germany, and these quickly fell into German hands, providing an important addition to their own woefully inadequate resources.



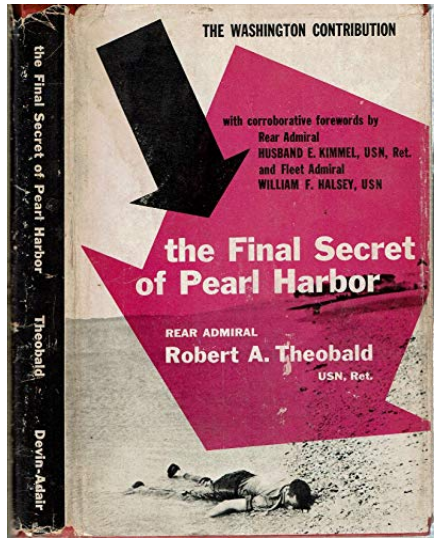
THE CHIEF
CULPRIT
Stalin's Grand Design to Start World War II
Viktor Suvorov
Author of Icebreaker: Who Started the Second World War?

Although almost totally ignored in the English-language world, Suvorov's seminal book soon became an unprecedented bestseller in Russia, Germany, and many other parts of the world, and together with several follow-up volumes, his five million copies in print established him as the most widely-read military historian in the history of the world. Meanwhile, the English-language media and academic communities scrupulously maintained their complete blackout of the ongoing worldwide debate, with no publishing house even willing to produce an English edition of Suvorov's books until an editor at the prestigious Naval Academy Press finally broke the embargo nearly two decades later.

Although the primary focus of this discussion has been with regard to the European war, the circumstances of the Pacific conflict also seem to differ greatly from our official history. Japan had been fighting in China since 1937, but this is seldom regarded as the start of the world war. Instead, the December 7th, 1941 attack on Pearl Harbor is usually considered the point at which the war became global.

From 1940 onward, FDR had been making a great political effort to directly involve America in the war against Germany, but public opinion was overwhelmingly on the other side, with polls showing that up to 80% of the population were opposed. All of this immediately changed once the Japanese bombs dropped on Hawaii, and suddenly the country was at war.

Given these facts, there were natural suspicions that Roosevelt had deliberately provoked the attack by his executive decisions to freeze Japanese assets, embargo all shipments of vital fuel oil supplies, and rebuff the repeated requests by Tokyo leaders for negotiations. In the 1953 volume edited by Barnes, noted diplomatic historian Charles Tansill summarized his very strong case that FDR sought to use a Japanese attack as his best "back door to war" against Germany, an argument he had made the previous year in a book of that same name. Over the decades, the information contained in private diaries and government documents seems to have almost conclusively established this interpretation, with Secretary of War Henry Stimson indicating that the plan was to "maneuver [Japan] into firing the first shot." In his later memoirs, Prof. Oliver drew upon the intimate knowledge he had acquired during his wartime role in Military Intelligence to even claim that FDR had deliberately tricked the Japanese into believing he planned to launch a surprise attack against their forces, thereby persuading them to strike first in self-defense.



By 1941 the U.S. had broken all the Japanese diplomatic codes and was freely reading their secret communications. Therefore, there has also long existed the widespread if disputed belief that the president was well aware of the planned Japanese attack on our fleet and deliberately failed to warn his local commanders, thereby ensuring that the resulting heavy American losses would produce a vengeful nation united for war. Tansill and a former chief researcher for the Congressional investigating committee made this case in the same 1953 Barnes volume, and the following year a former US admiral published *The Final Secret of Pearl Harbor*, providing similar arguments at greater length. This book also included an introduction by one of America's highest-ranking World War II naval commanders, who fully endorsed the controversial theory.

In 2000, journalist Robert M. Stinnett published a wealth of additional supporting evidence, based upon his eight years of archival research, which was discussed in a recent article. A telling point made by Stinnett is that if Washington had warned the Pearl Harbor commanders, their resulting defensive preparations would have been noticed by the local Japanese spies and relayed to the approaching task force; and with the element of surprise lost, the attack probably would have been aborted, thus frustrating all of FDR's long-standing plans for war. Although various details may be disputed, I find the evidence for Roosevelt's foreknowledge quite compelling.

## The Central Jewish Role in Orchestrating World

## War II

Roosevelt's economic problems had led him to seek a foreign war, but it was probably the overwhelming Jewish hostility to Nazi Germany that pointed him in that particular direction. The confidential report of the Polish ambassador to the U.S. as quoted by John Wear provides a striking description of the political situation in America at the beginning of 1939:

> There is a feeling now prevalent in the United States marked by growing hatred of Fascism, and above all of Chancellor Hitler and everything connected with National Socialism. Propaganda is mostly in the hands of the Jews who control almost 100% [of the] radio, film, daily and periodical press. Although this propaganda is extremely coarse and presents Germany as black as possible– above all religious persecution and concentration camps are exploited–this propaganda is nevertheless extremely effective since the public here is completely ignorant and knows nothing of the situation in Europe.
>
> At the present moment most Americans regard Chancellor Hitler and National Socialism as the greatest evil and greatest peril threatening the world. The situation here provides an excellent platform for public speakers of all kinds, for emigrants from Germany and Czechoslovakia who with a great many words and with most various calumnies incite the public. They praise American liberty which they contrast with the totalitarian states.
>
> It is interesting to note that in this extremely well-planned campaign which is conducted above all against National Socialism, Soviet Russia is almost completely eliminated. Soviet Russia, if mentioned at all, is mentioned in a friendly manner and things are presented in such a way that it would seem that the Soviet Union were cooperating with the bloc of democratic states. Thanks to the clever propaganda the sympathies of the American public are completely on the side of Red Spain.

Given the heavy Jewish involvement in financing Churchill and his allies and also steering the American government and public in the direction of war against Germany, organized Jewish groups probably bore the central responsibility for provoking the world war, and this was surely recognized by most knowledgeable individuals at the time. Indeed, the Forrestal Diaries recorded the very telling statement by our ambassador in London: "Chamberlain, he says, stated that

America and the Jews had forced England into the war."

LATE NEWS

The ongoing struggle between Hitler and international Jewry had been receiving considerable public attention for years. During his political rise, Hitler had hardly concealed his intent to dislodge Germany's tiny Jewish population from the stranglehold they had gained over German media and finance, and instead run the country in the best interests of the 99% German majority, a proposal that provoked the bitter hostility of Jews everywhere. Indeed, immediately after he came into office, a major London newspaper had carried a memorable 1933 headline announcing that the Jews of the world had declared war on Germany, and were organizing an international boycott to starve the Germans into submission.

In recent years, somewhat similar Jewish-organized efforts at international sanctions aimed at bringing recalcitrant nations to their knees have become a regular part of global politics. But these days the Jewish dominance of the U.S. political system has become so overwhelming that instead of private boycotts, such actions are directly enforced by the American government. To some extent, this had already been the case with Iraq during the 1990s, but became far more common after the turn of the new century.

Although our official government investigation concluded that the total financial cost of the 9/11 terrorist attacks had been an absolutely trivial sum, the Neocon-dominated Bush Administration nonetheless used this as an excuse to establish an important new Treasury Department position, the Under Secretary for Terrorism and Financial Intelligence. That office soon began utilizing America's control of the global banking system and dollar-denominated international trade to enforce financial sanctions and wage economic warfare, with these measures typically being directed against individuals, organizations, and nations considered unfriendly towards Israel, notably Iran,

Hezbollah, and Syria.

Perhaps coincidentally, although Jews comprise merely 2% of the American population, all four individuals holding that very powerful post over the last 15 years since its inception—Stuart A. Levey, David S. Cohen, Adam Szubin, Sigal Mandelker—have been Jewish, with the most recent of these being an Israeli citizen. Levey, the first Under Secretary, began his work under President Bush, then continued without a break for years under President Obama, underscoring the entirely bipartisan nature of these activities.

Most foreign policy experts have certainly been aware that Jewish groups and activists played the central role in driving our country into its disastrous 2003 Iraq War, and that many of these same groups and individuals have spent the last dozen years or so working to foment a similar American attack on Iran, though as yet unsuccessfully. This seems quite reminiscent of the late 1930s political situation in Britain and America.

Individuals outraged by the misleading media coverage surrounding the Iraq War but who have always casually accepted the conventional narrative of World War II should consider a thought-experiment I suggested last year:

> When we seek to understand the past, we must be careful to avoid drawing from a narrow selection of sources, especially if one side proved politically victorious in the end and completely dominated the later production of books and other commentary. Prior to the existence of the Internet, this was an especially difficult task, often requiring a considerable amount of scholarly effort, even if only to examine the bound volumes of once popular periodicals. Yet without such diligence, we can fall into very serious error.
>
> The Iraq War and its aftermath was certainly one of the central events in American history during the 2000s. Yet suppose some readers in the distant future had only the collected archives of *The Weekly Standard*, *National Review*, the *WSJ* op-ed page, and *FoxNews* transcripts to furnish their understanding the history of that period, perhaps along with the books written by the contributors to those outlets. I doubt that more than a small fraction of what they would read could be categorized as outright lies. But the massively skewed coverage, the distortions, exaggerations, and especially the breathtaking omissions would surely provide them with an exceptionally unrealistic view of what had actually happened during that important period.

Another striking historical parallel has the fierce demonization of Russian President Vladimir Putin, who provoked the great hostility of Jewish elements when he ousted the handful of Jewish Oligarchs who had seized control of Russian society under the drunken misrule of President Boris Yeltsin and totally impoverished the bulk of the population. This conflict intensified after Jewish investor William F. Browder arranged Congressional passage of the Magnitsky Act to punish Russian leaders for the legal actions they had taken against his huge financial empire in their country. Putin's harshest Neocon critics have often condemned him as "a new Hitler" while some neutral observers have agreed that no foreign leader since the German Chancellor of the 1930s has been so fiercely vilified in the American media. Seen from a different angle, there may indeed be a close correspondence between Putin and Hitler, but not in the way usually suggested.

Knowledgeable individuals have certainly been aware of the crucial Jewish role in orchestrating our military or financial attacks against Iraq, Iran, Syria, and Russia, but it has been exceptionally rare for any prominent public figures or reputable journalists to mention these facts lest they be denounced and vilified by zealous Jewish activists and the media they dominate. For example, a couple of years ago a single suggestive Tweet by famed CIA anti-proliferation operative Valerie Plame provoked such an enormous wave of vituperation that she was forced to resign her position at a prominent non-profit. A close parallel involving a far more famous figure had occurred three generations earlier:

> These facts, now firmly established by decades of scholarship, provide some necessary context to Lindbergh's famously controversial speech at an America First rally in September 1941. At that event, he charged that three groups in particular were "pressing this country toward war[:] the British, the Jewish, and the Roosevelt Administration," and thereby unleashed an enormous firestorm of media attacks and denunciations, including widespread accusations of anti-Semitism and Nazi sympathies. Given the realities of the political situation, Lindbergh's statement constituted a perfect illustration of Michael Kinsley's famous quip that "a gaffe is when a politician tells the truth – some obvious truth he isn't supposed to say." But as a consequence, Lindbergh's once-heroic reputation suffered enormous and permanent damage, with the campaign of vilification echoing for the remaining three decades of his life, and even well beyond. Although he was not entirely purged from public life, his standing was certainly never even remotely the same.

With such examples in mind, we should hardly be surprised that for decades this huge Jewish involvement in orchestrating World War II was carefully omitted from nearly all subsequent historical narratives, even those that sharply challenged the mythology of the official account. The index of Taylor's iconoclastic 1961 work contains absolutely no mention of Jews, and the same is true of the previous books by Chamberlin and Grenfell. In 1953, Harry Elmer Barnes, the dean of historical revisionists, edited his major volume aimed at demolishing the falsehoods of World War II, and once again any discussion of the Jewish role was almost entirely lacking, with only part of one single sentence and Chamberlain's dangling short quote appearing across more than 200,000 words of text. Both Barnes and many of his contributors had already been purged and their book was only released by a tiny publisher in Idaho, but they still sought to avoid certain unmentionables.

Even the arch-revisionist David Hoggan seems to have carefully skirted the topic of Jewish influence. His 30 page index lacks any entry on Jews and his 700 pages of text contain only scattered references. Indeed, although he does quote the explicit private statements of both the Polish ambassador and the British Prime Minister emphasizing the enormous Jewish role in promoting the war, he then rather questionably asserts that these confidential statements of individuals with the best understanding of events should simply be disregarded.

In the popular Harry Potter series, Lord Voldemort, the great nemesis of the young magicians, is often identified as "He Who Must Not Be Named," since the mere vocalization of those few particular syllables might bring doom upon the speaker. Jews have long enjoyed enormous power and influence over the media and political life, while fanatic Jewish activists demonstrate hair-trigger eagerness to denounce and vilify all those suspected of being insufficiently friendly towards their ethnic group. The combination of these two factors has therefore induced such a "Lord Voldemort Effect" regarding Jewish activities in most writers and public figures. Once we recognize this reality, we should become very cautious in analyzing controversial historical issues that might possibly contain a Jewish dimension, and also be particularly wary of arguments from silence.

Those writers willing to break this fearsome Jewish Taboo regarding World War II were quite rare, but one notable exception comes to mind. As I recently wrote:

Some years ago, I came across a totally obscure 1951 book entitled *The Iron Curtain Over America* by John Beaty, a well-regarded university professor. Beaty had spent his wartime years in Military Intelligence, being tasked with preparing the daily briefing reports distributed to all top American officials summarizing available intelligence information acquired during the previous 24 hours, which was obviously a position of considerable responsibility.

As a zealous anti-Communist, he regarded much of America's Jewish population as deeply implicated in subversive activity, therefore constituting a serious threat to traditional American freedoms. In particular, the growing Jewish stranglehold over publishing and the media was making it increasingly difficult for discordant views to reach the American people, with this regime of censorship constituting the "Iron Curtain" described in his title. He blamed Jewish interests for the totally unnecessary war with Hitler's Germany, which had long sought good relations with America, but instead had suffered total destruction for its strong opposition to Europe's Jewish-backed Communist menace.

Then as now, a book taking such controversial positions stood little chance of finding a mainstream New York publisher, but it was soon released by a small Dallas firm, and then became enormously successful, going through some seventeen printings over the next few years. According to Scott McConnell, founding editor of *The American Conservative*, Beaty's book became the second most popular conservative text of the 1950s, ranking only behind Russell Kirk's iconic classic, *The Conservative Mind*.

Books by unknown authors that are released by tiny publishers rarely sell many copies, but the work came to the attention of George E. Stratemeyer, a retired general who had been one of Douglas MacArthur's commanders, and he wrote Beaty a letter of endorsement. Beaty began including that letter in his promotional materials, drawing the ire of the ADL, whose national chairman contacted Stratemeyer, demanding that he repudiate the book, which was described as a "primer for lunatic fringe groups" all across America. Instead, Stratemeyer delivered a blistering reply to the ADL, denouncing it for making "veiled threats" against "free expression and thoughts" and trying to establish Soviet-style repression in the United States. He declared that every "loyal citizen" should read *The Iron Curtain Over America*, whose pages finally revealed the truth about our national predicament, and he began actively promoting the book around

the country while attacking the Jewish attempt to silence him. Numerous other top American generals and admirals soon joined Stratemeyer in publicly endorsing the work, as did a couple of influential members of the U.S. Senate, leading to its enormous national sales.

In contrast to nearly all the other World War II narratives discussed above, whether orthodox or revisionist, the index of Beaty's volume is absolutely overflowing with references to Jews and Jewish activities, containing dozens of separate entries and with the topic mentioned on a substantial fraction of all the pages in his fairly short book. I therefore suspect that any casual modern reader who encountered Beaty's volume would be stunned and dismayed by such extremely pervasive material, and probably dismiss the author as being delusional and "Jew-obsessed"; but I think that Beaty's treatment is probably the far more honest and realistic one. As I noted last year on a related matter:

> …once the historical record has been sufficiently whitewashed or rewritten, any lingering strands of the original reality that survive are often perceived as bizarre delusions or denounced as "conspiracy theories."

Beaty's wartime role at the absolute nexus of American Intelligence certainly gave him a great deal of insight into the pattern of events, and the glowing endorsement of his account by many of our highest-ranking military commanders supports that conclusion. More recently, a decade of of archival research by Prof. Joseph Bendersky, a prominent mainstream historian, revealed that Beaty's views were privately shared by many of our Military Intelligence professionals and top generals of the era, being quite widespread in such circles.

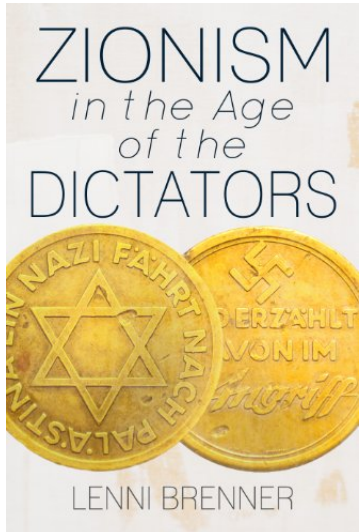
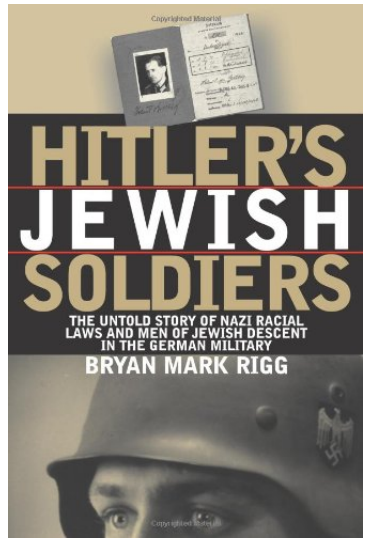
## The "Black Legend" of Adolf Hitler and Nazi Germany

During the late 1960s, historians once again began focusing upon the central role of Jews in the world war. Indeed, over the last few decades, the bitter conflict between Nazi Germany and world Jewry has become such an overwhelming theme of our popular media that

this element may be almost the only aspect of the World War II era that is known to many younger Americans. But the true history is actually far more complex than the simple cartoon that Hitler was bad and he hated the Jews because they were good.



Among other matters, there exists the historical reality of the important Nazi-Zionist economic partnership of the 1930s, which played such a crucial role in establishing the State of Israel. Although these facts are thoroughly documented and even received some major media coverage during the 1980s, notably by the august *Times of London*, in recent decades the story has been so massively suppressed that a couple of years ago a prominent leftist politician was driven out of the British Labour Party merely for alluding to it. David Irving also uncovered the fascinating detail that the two largest German financial donors to the Nazis during their rise to power were both Jewish bankers, one of them being the country's most prominent Zionist leader, though the motives involved were not entirely clear.



HITLER'S
JEWISH
SOLDIERS
THE UNTOLD STORY OF NAZI RACIAL LAWS AND MEN OF JEWISH DESCENT IN THE GERMAN MILITARY
BRYAN MARK RIGG

Another obscured fact is that some 150,000 half- and quarter-Jews served loyally in Hitler's World War II armies, mostly as combat officers, and these included at least 15 half-Jewish generals and admirals, with another dozen quarter-Jews holding those same high ranks. The most notable example was Field Marshal Erhard Milch, Hermann Goering's powerful second-in-command, who played such an important operational role in creating the Luftwaffe. Milch certainly had a Jewish father, and according to some much less substantiated claims, perhaps even a Jewish mother as well, while his sister was married to an SS general.

Meanwhile, although our heavily Jewish-dominated media regularly presents Hitler as the most evil man who ever lived, many of his prominent contemporaries seem to have held a very different opinion. As I recently wrote:

[image]

> By resurrecting a prosperous Germany while nearly all other countries remained mired in the worldwide Great Depression, Hitler drew glowing accolades from individuals all across the ideological spectrum. After an extended 1936 visit, David Lloyd George, Britain's former wartime prime minister, fulsomely praised the chancellor as "the George Washington of Germany," a national hero of the greatest stature. Over the years, I've seen plausible claims here and there that during the 1930s Hitler was widely acknowledged as the world's most popular and successful national leader, and the fact that he was selected as *Time Magazine*'s Man of the Year for 1938 tends to support this belief.

I discovered a particular example of such missing perspectives earlier this year when I decided to read *The Prize*, Daniel Yergin's magisterial and Pulitzer Prize-winning 1991 history of the world oil industry, and came across a few surprising paragraphs buried deep within the 900 pages of dense text. Yergin explained that during the mid-1930s the imperious chairman of Royal Dutch Shell, who had spent decades at the absolute summit of the British business world, became greatly enamored of Hitler and his Nazi government. He believed that an Anglo-German alliance was the best means of maintaining European peace and protecting the continent from the Soviet menace, and even retired to Germany in accordance with his new sympathies.

Since the actual history of this era has been so thoroughly replaced by extreme propaganda, academic specialists who closely investigate particular topics sometimes encounter puzzling anomalies. For example, a bit of very casual Googling brought to my attention an interesting article by a leading biographer of famed Jewish modernist writer Gertrude Stein, who seemed totally mystified why her feminist icon seemed to have been a major admirer of Hitler and an enthusiastic supporter of the pro-German Vichy government of France. The author also notes that Stein was hardly alone in her sentiments, which were generally shared by so many of the leading writers and philosophers of that period.

There is also the very interesting but far less well documented case of Lawrence of Arabia, one of the greatest British military heroes to come out of the First World War and who may have been moving in a rather similar direction just before his 1935 death in a possibly suspicious motorcycle accident. An alleged account of his evolving political views seems extremely detailed and perhaps worth investigating, with the original having been scrubbed from the Internet but still available at Archive.org.

A couple of years ago, the 1945 diary of a 28-year-old John F. Kennedy travelling in post-war Europe was sold at auction, and the contents revealed his rather favorable fascination with Hitler. The youthful JFK predicted that "Hitler will emerge from the hatred that surrounds him now as one of the most significant figures who ever lived" and felt that "He had in him the stuff of which legends are made." These sentiments are particularly notable for having been expressed just after the end of a brutal war against Germany and despite the tremendous volume of hostile propaganda that had accompanied it.

The political enthusiasms of literary intellectuals, young writers, or

even elderly businessmen are hardly the most reliable sources by which to evaluate a particular regime. But earlier this year, I pointed to a fairly comprehensive appraisal of the origins and policies of National Socialist Germany by one of Britain's most prominent historians:

> Not long ago, I came across a very interesting book written by Sir Arthur Bryant, an influential historian whose Wikipedia page describes him as the personal favorite of Winston Churchill and two other British prime ministers. He had worked on *Unfinished Victory* during the late 1930s, then somewhat modified it for publication in early 1940, a few months after the outbreak of World War II had considerably altered the political landscape. But not long afterward, the war became much more bitter and there was a harsh crackdown on discordant voices in British society, so Bryant became alarmed over what he had written and attempted to remove all existing copies from circulation. Therefore the only ones available for sale on Amazon are exorbitantly priced, but fortunately the work is also freely available at Archive.org.
>
> Writing before the "official version" of historical events had been rigidly determined, Bryant describes Germany's very difficult domestic situation between the two world wars, its problematic relationship with its tiny Jewish minority, and the circumstances behind the rise of Hitler, providing a very different perspective on these important events than what we usually read in our standard textbooks.
>
> Among other surprising facts, he notes that although Jews were just 1% of the total population, even five years after Hitler had come to power and implemented various anti-Semitic policies, they still apparently owned "something like a third of the real property" in that country, with the great bulk of these vast holdings having been acquired from desperate, starving Germans in the terrible years of the early 1920s. Thus, much of Germany's 99% German population had recently been dispossessed of the assets they had built up over generations…

Bryant also candidly notes the enormous Jewish presence in the leadership of the Communist movements that had temporarily seized power after World War I, both in major portions of Germany and in nearby Hungary. This was an ominous parallel to the overwhelmingly Jewish Bolsheviks who had gained control of Russia and then butchered or expelled that country's traditional Russian and German ruling elites, and therefore a major source of Nazi fears.

Unlike so many of the other historians previously discussed, after the political climate changed Bryant assiduously worked to expunge his suddenly unfashionable views from the written record, and as a consequence went on to enjoy a long and successful career, topped by the accolades of a grateful British establishment. But I suspect that his long-suppressed 1940 volume, presenting a reasonably favorable view of Hitler and Nazi Germany, is probably more accurate and realistic than the many thousands of propaganda-drenched works by others that soon followed. I have now incorporated it into my HTML Books system, so those so interested can read it and decide for themselves.

## The Enormous Scale of Allied War Crimes

For most present-day Americans, the primary image associated with Hitler and his German regime is the horrendous scale of the war-crimes that they supposedly committed during the global conflict that they are alleged to have unleashed. But in one of his lectures, Irving made the rather telling observation that the relative scale of such World War II crimes and especially their evidentiary base might not necessarily point in the direction of implicating the Germans.

Although Hollywood and those in its thrall have endlessly cited the findings of the Nuremberg Tribunals as the final word on Nazi barbarism, even a cursory examination of those proceedings raises enormous skepticism. As time passed, historians gradually acknowledged that some of the most shocking and lurid pieces of evidence used to secure worldwide condemnation of the defendants—the human lampshades and bars of soap, the shrunken heads—were entirely fraudulent. The Soviets were determined to prosecute the Nazis for the Katyn Forest massacre of the captured Polish officer corps even though the Western Allies were convinced that Stalin had actually been responsible, a belief eventually confirmed by Gorbachev and the newly-opened Soviet archives. If the Germans had actually done so many horrible things, one wonders why the prosecution would have bothered including such fabricated and false charges.

And over the decades, considerable evidence has accumulated that the Gas Chambers and the Jewish Holocaust—the central elements of today's Nazi "Black Legend"—were just as fictional as all those other

items. The Germans were notoriously meticulous record-keepers, embracing orderly bureaucracy like no other people, and nearly all their archives were captured at the end of the war. Under these circumstances, it seems rather odd that there are virtually no traces of the plans or directives associated with the monstrous crimes that their leadership supposedly ordered committed in such massively industrial fashion. Instead, the entirety of the evidence seems to consist of a tiny quantity of rather doubtful documentary material, the dubious interpretations of certain phrases, and various German confessions, often obtained under brutal torture.

Given his crucial wartime role in Military Intelligence, Beaty was particularly harsh in his denunciation of the proceedings, and the numerous top American generals who endorsed his book add considerably to the weight of his verdict:

> He was scathing toward the Nuremberg Trials, which he described as a "major indelible blot" upon America and "a travesty of justice." According to him, the proceedings were dominated by vengeful German Jews, many of whom engaged in falsification of testimony or even had criminal backgrounds. As a result, this "foul fiasco" merely taught Germans that "our government had no sense of justice." Sen. Robert Taft, the Republican leader of the immediate postwar era took a very similar position, which later won him the praise of John F. Kennedy in *Profiles in Courage*. The fact that the chief Soviet prosecutor at Nuremberg had played the same role during the notorious Stalinist show trials of the late 1930s, during which numerous Old Bolsheviks confessed to all sorts of absurd and ridiculous things, hardly enhanced the credibility of the proceedings to many outside observers.

By contrast, Irving notes that if the Allies had instead been in the dock at Nuremberg, the evidence of their guilt would have been absolutely overwhelming. After all, it was Churchill who began the illegal terror-bombing of cities, a strategy deliberately intended to provoke German retaliation and which eventually led to the death of a million or more European civilians. Late in the war, military reversals had even persuaded the British leader to order similarly illegal poison gas attacks against German cities, along with the initiation of even more horrific biological warfare involving anthrax bombs. Irving located these signed directives in the British archives, although Churchill was later persuaded to countermand them before they were carried out. By contrast, German archival material demonstrates that Hitler had repeatedly ruled out any first use of such illegal weapons under any

circumstances, even though Germany's far deadlier arsenal might have turned the tide of the war in its favor.

Although long forgotten today, Freda Utley was a mid-century journalist of some prominence. Born an Englishwoman, she had married a Jewish Communist and moved to Soviet Russia, then fled to America after her husband fell in one of Stalin's purges. Although hardly sympathetic to the defeated Nazis, she strongly shared Beaty's view of the monstrous perversion of justice at Nuremberg and her first-hand account of the months spent in Occupied Germany is eye-opening in its description of the horrific suffering imposed upon the prostrate population even years after the end of the war. Moreover:

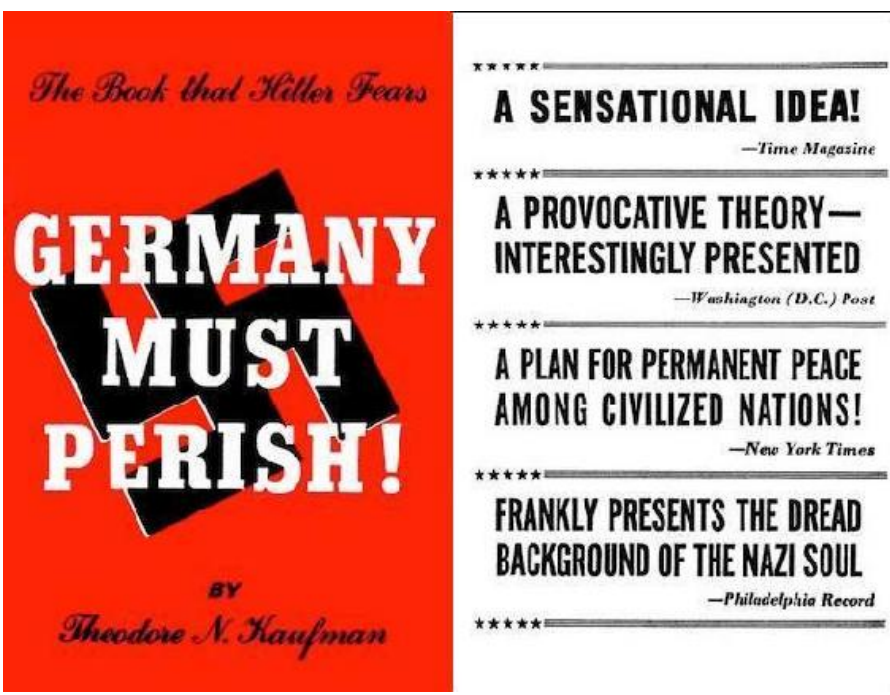
> Her book also gives substantial coverage to the organized expulsions of ethnic Germans from Silesia, the Sudatenland, East Prussia, and various other parts of Central and Eastern Europe where they had peacefully lived for many centuries, with the total number of such expellees generally estimated at 13 to 15 million. Families were sometimes given as little as ten minutes to leave the homes in which they had resided for a century or more, then forced to march off on foot, sometimes for hundreds of miles, towards a distant land they had never seen, with their only possessions being what they could carry in their own hands. In some cases, any surviving menfolk were separated out and shipped off to slave-labor camps, thereby producing an exodus consisting solely of women, children, and the very elderly. All estimates were that at least a couple million perished along the way, from hunger, illness, or exposure.
>
> These days we endlessly read painful discussions of the notorious "Trail of Tears" suffered by the Cherokees in the distant past of the early 19th century, but this rather similar 20th Century event was nearly a thousand-fold larger in size. Despite this huge discrepancy in magnitude and far greater distance in time, I would guess that the former event may command a thousand times the public awareness among ordinary Americans. If so, this would demonstrate that overwhelming media control can easily shift perceived reality by a factor of a million or more.
>
> The population movement certainly seems to have represented the largest ethnic-cleansing in the history of the world, and if the Germany had ever done anything even remotely similar during its years of European victories and conquests, the visually-gripping scenes of such an enormous flood of desperate, trudging refugees would surely have become a centerpiece of numerous World War

> II movies of the last seventy years. But since nothing like that ever happened, Hollywood screenwriters lost a tremendous opportunity.

I think perhaps the most plausible explanation for the widespread promotion of a multitude of largely fictional German war-crimes at Nuremberg was to camouflage and obscure the very real ones actually committed by the Allies.

Other related indicators may be found in the extreme tone of some of the American publications of the period, even those produced well before our country even entered the war. For example:

> But as early as 1940, an American Jew named Theodore Kaufman became so enraged at what he regarded as Hitler's mistreatment of German Jewry that he published a short book evocatively entitled *Germany Must Perish!*, in which he explicitly proposed the total extermination of the German people. And that book apparently received favorable if perhaps not entirely serious discussion in many of our most prestigious media outlets, including the *New York Times*, the *Washington Post*, and *Time Magazine*.



Surely any such similar book published in Hitler's Germany that advocated the extermination of all Jews or Slavs would have been a centerpiece at Nuremberg, and any newspaper reviewers who had treated it favorably would probably have stood in the dock for "crimes against humanity."

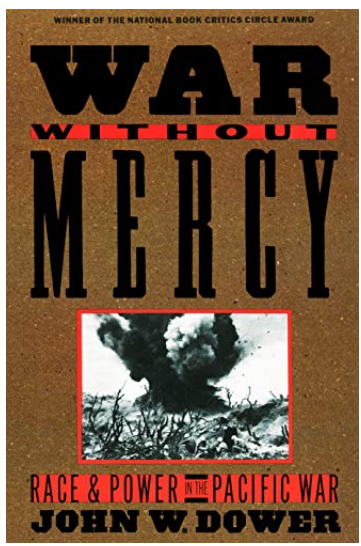
Meanwhile, the terrible nature of the Pacific War fought in the aftermath of Pearl Harbor is suggested by a 1944 issue of *Life* magazine that carried the photo of a young American woman with the skull of a Japanese soldier her boyfriend had sent her as a war souvenir. If any Nazi magazines ever featured similar images, I doubt the Allies would have had any need to fabricate ridiculous stories of human lampshades or soap.

And remarkably enough, that grotesque scene actually provides a reasonably accurate indication of the savage atrocities that were regularly committed during the brutal fighting of the Pacific Theater. These unpleasant facts were fully set forth in *War Without Mercy,* an award-winning 1986 volume by eminent American historian John W. Dower that received glowing accolades by leading scholars and public intellectuals.

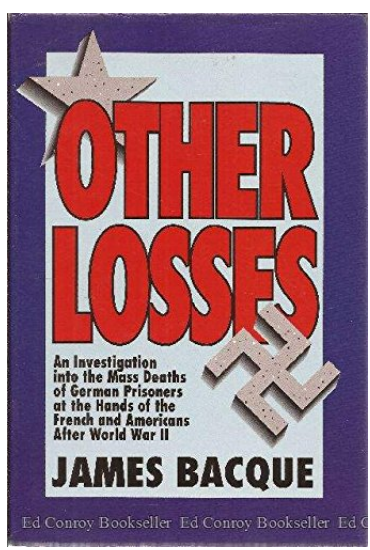


The unfortunate truth is that Americans typically massacred Japanese who sought to surrender or who had even already been taken as prisoners, with the result that only a small slice—during some years merely a tiny sliver—of Japanese troops defeated in battle ever survived. The traditional excuse publicly offered for the virtual

absence of any Japanese POWs was that their *Bushido* code made surrender unthinkable, yet when the Soviets defeated Japanese armies in 1945, they had no difficulty capturing over a million prisoners. Indeed, since interrogating prisoners was important for intelligence purposes, late in the war U.S. commanders began offering rewards such as ice cream to their troops for bringing some surrendering Japanese in alive rather than killing them in the field.

American GIs also regularly committed remarkably savage atrocities. Dead or wounded Japanese frequently had their gold teeth knocked out and taken as war-booty, and their ears were often cut-off and kept as souvenirs, as was also sometimes the case with their skulls. Meanwhile, Dower notes the absence of any evidence suggesting similar behavior on the other side. The American media generally portrayed the Japanese as vermin fit for eradication, and numerous public statements by high-ranking American military leaders explicitly claimed that the bulk of the entire Japanese population would probably need to be exterminated in order to bring the war to a successful conclusion. Comparing such thoroughly-documented facts with the rather tenuous accusations usually leveled against Nazi political or military leaders is quite revealing.

During the late 1980s evidence of other deep wartime secrets suddenly came to light.



OTHER
LOSSES
An Investigation into the Mass Deaths of German Prisoners at the Hands of the French and Americans After World War II
JAMES BACQUE
Ed Conroy Bookseller Ed Conroy Bookseller

While visiting France during 1986 in preparation for an unrelated

book, a Canadian writer named James Bacque stumbled upon clues suggesting that one of the most terrible secrets of post-war Germany had long remained completely hidden, and he soon embarked upon extensive research into the subject, finally publishing *Other Losses* in 1989. Based upon very considerable evidence, including government records, personal interviews, and recorded eyewitness testimony, he argued that after the end of the war, the Americans had starved to death as many as a million German POWs, seemingly as a deliberate act of policy, a war crime that would surely rank among the greatest in history.

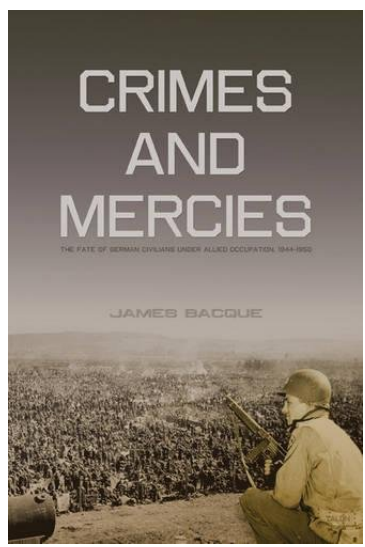
For decades, Western propagandists had relentlessly barraged the Soviets with claims that they were keeping back a million or more missing German POWs as slave-laborers in their Gulag, while the Soviets had endlessly denied these accusations. According to Bacque, the Soviets had been telling the truth all along, and the missing soldiers had been among the enormous numbers who had fled westward near the end of the war, seeking what they assumed would be far better treatment at the hands of the advancing Anglo-American armies. But instead, they were denied all normal legal protections, and confined under horrible conditions where they rapidly perished of hunger, illness, and exposure.

Without attempting to summarize Bacque's extensive accumulation of supporting material, a few of his factual elements are worth mentioning. At the close of hostilities, the American government employed circuitous legal reasoning to argue that the many millions of German troops that they had captured should not be considered prisoners of war and therefore were not covered by the provisions of the Geneva Convention. Soon afterward, attempts by the International Red Cross to provide food shipments to the enormous Allied prison camps were repeatedly rejected, and notices were posted throughout the nearby German towns and villages that any civilian who attempted to smuggle food to the desperate POWs might be shot on sight. These undeniable historical facts do seem to suggest certain dark possibilities.

Although initially released by an obscure publisher, Bacque's book soon became a sensation and an international best-seller. He paints Gen. Dwight Eisenhower as the central culprit behind the tragedy, noting the far lower POW losses in areas outside his control, and suggests that as a highly ambitious political general of German-American ancestry, he may have been under

intense pressure to demonstrate his harshness toward the defeated *Wehrmacht* foe.

Furthermore, once the Cold War ended and the Soviet Archives were open to scholars, their contents seem to have strongly validated Bacque's thesis. He notes that although the archives do contain explicit evidence of such long-denied atrocities as Stalin's Katyn Forest massacre of Poland's officer corps, they show absolutely no signs of any million missing German POWs, who instead had very likely ended their lives in the starvation and illness of Eisenhower's death camps. Bacque points out that the German government has issued severe legal threats against anyone seeking to investigate the likely sites of the mass graves that might hold the remains of those long-dead POWs, and in an updated edition, he also mentions Germany's enactment of harsh new laws meting out heavy prison sentences to anyone who merely questions the official narrative of World War II.



Bacque's discussion of the new evidence of the Kremlin archives constitutes a relatively small portion of his 1997 sequel, *Crimes and Mercies*, which centered around an even more explosive analysis, and also became an international best-seller.

As described above, first-hand observers of post-war Germany in 1947 and 1948 such as Gollanz and Utley, had directly reported on the horrific conditions they discovered, and stated that for years official food rations for the entire population had been comparable to that of the inmates of Nazi concentration camps

and sometimes far lower, leading to the widespread malnutrition and illness they witnessed all around them. They also noted the destruction of most of Germany's pre-war housing stock and the severe overcrowding produced by the influx of so many millions of pitiful ethnic German refugees expelled from other parts of Central and Eastern Europe. But these visitors lacked any access to solid population statistics, and could only speculate upon the enormous human death toll that hunger and illness had already inflicted, and which would surely continue if policies were not quickly changed.

Years of archival research by Bacque attempt to answer this question, and the conclusion he provides is certainly not a pleasant one. Both the Allied military government and the later German civilian authorities seem to have made a concerted effort to hide or obscure the true scale of the calamity visited upon German civilians during the years 1945-1950, and the official mortality statistics found in government reports are simply too fantastical to possibly be correct, although they became the basis for the subsequent histories of that period. Bacque notes that these figures suggest that the death rate during the terrible conditions of 1947, long remembered as the "Hunger Year" (*Hungerjahr*) and vividly described in Gollancz's account, was actually lower than that of the prosperous Germany of the late 1960s. Furthermore, private reports by American officials, mortality rates from individual localities, and other strong evidence demonstrate that these long-accepted aggregate numbers were essentially fictional.

Instead, Bacque attempts to provide more realistic estimates based upon an examination of the population totals of the various German censuses together with the recorded influx of the huge number of German refugees. Based upon this simple analysis, he makes a reasonably strong case that the excess German deaths during that period amounted to at least around 10 million, and possibly many millions more. Furthermore, he provides substantial evidence that the starvation was either deliberate or at least enormously worsened by American government resistance to overseas food relief efforts. Perhaps these numbers should not be so totally surprising given that the official Morgenthau Plan had envisioned the elimination of around 20 million Germans, and as Bacque demonstrates, top American leaders quietly agreed to continue that policy in practice even while they renounced it in theory.

Assuming these numbers are even remotely correct, the implications are quite remarkable. The toll of the human catastrophe experienced in post-war Germany would certainly rank among the greatest in modern peacetime history, far exceeding the deaths that occurred during the Ukrainian Famine of the early 1930s and possibly even approaching the wholly unintentional losses during Mao's Great Leap Forward of 1959-61. Furthermore, the post-war German losses would vastly outrank either of these other unfortunate events in percentage terms and this would remain true even if the Bacque's estimates are considerably reduced. Yet I doubt if even a small fraction of one percent of Americans are today aware of this enormous human calamity. Presumably memories are much stronger in Germany itself, but given the growing legal crackdown on discordant views in that unfortunate country, I suspect that anyone who discusses the topic too energetically risks immediate imprisonment.

To a considerable extent, this historical ignorance has been heavily fostered by our governments, often using underhanded or even nefarious means. Just like in the old decaying USSR, much of the current political legitimacy of today's American government and its various European vassal-states is founded upon a particular narrative history of World War II, and challenging that narrative might produce dire political consequences. Bacque credibly relates some of the apparent efforts to dissuade any major newspaper or magazine from running articles discussing the startling findings of his first book, thereby imposing a "blackout" aimed at absolutely minimizing any media coverage. Such measures seem to have been quite effective, since until eight or nine years ago, I'm not sure I had ever heard a word of these shocking ideas, and I have certainly never seen them seriously discussed in any of the numerous newspapers or magazines that I have carefully read over the last three decades.

Even illegal means were employed to hinder the efforts of this solitary, determined scholar. At times, Bacque's phone-lines were tapped, his mail intercepted, and his research materials surreptitiously copied, while his access to some official archives was blocked. Some of the elderly eyewitnesses who personally corroborated his analysis received threatening notes and had their property vandalized.

In his Foreword to this 1997 book, De Zayas, the eminent international human rights attorney, praised Bacque's ground-

breaking research, and hoped that it would soon lead to a major scholarly debate aimed at reassessing the true facts of these historical events that had taken place a half-century earlier. But in his update to the 2007 edition, he expressed some outrage that no such discussion ever occurred, and instead the German government merely passed a series of harsh laws mandating prison sentences for anyone who substantially disputed the settled narrative of World War II and its immediate aftermath, perhaps by overly focusing on the suffering of German civilians.

Although both of Bacque's books became international best-sellers, the near-complete absence of any secondary media coverage ensured that they never entered public awareness with anything more than a pinprick. Another important factor is the tremendously disproportionate reach of print and electronic media. A best-seller may be read by many tens of thousands of people, but a successful film might reach tens of millions, and so long as Hollywood churns out endless movies denouncing Germany's atrocities but not a single one on the other side, the true facts of that history are hardly likely to gain much traction. I strongly suspect that far more people today believe in the real-life existence of Batman and Spiderman than are even aware of the Bacque Hypothesis.

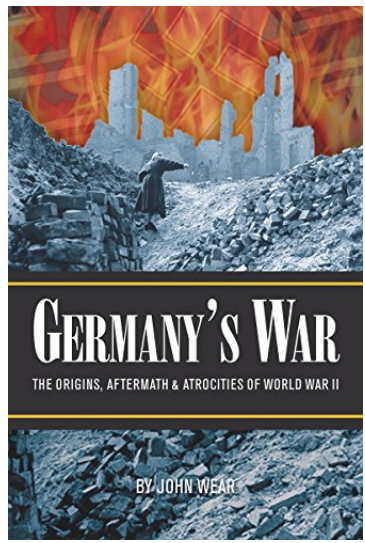
## "He Who Controls the Past Controls the Future"

Many of the elements presented above were drawn from my previous articles published over the last year or so, but I believe there is some value in providing this same material in unified form rather than only separately, even if the total length necessarily becomes quite considerable.

World War II dominates our twentieth century landscape like a colossus, and still casts huge shadows across our modern world. That global conflict has probably been the subject of far more sustained coverage, whether in print or electronic media, than any other event in human history. So if we encounter a small handful of highly anomalous items that seem to directly contradict such an ocean of enormously detailed and long-accepted information, there is a natural

tendency to dismiss these few outliers as implausible or even delusional. But once the total number of such discordant yet seemingly well-documented elements becomes sufficiently large, we must take them much more seriously, and perhaps eventually concede that most of them are probably correct. As was suggested in a quote widely if doubtfully attributed to Stalin, "Quantity has a quality all of its own."



I am hardly the first individual to gradually become aware of this sweeping and cohesive counter-narrative of the Second World War, and a few months ago I happened to read *Germany's War*, published in 2014 by amateur historian John Wear. Drawing from sources that substantially overlap with the ones I have discussed, his conclusions are reasonably similar to my own, but presented in a book length form that includes some 1,200 exact source references. So those interested in a much more detailed exposition of these same issues can read it and decide for themselves, conveniently available in an HTML format on this website.

- Germany's War
  *The Origins, Aftermath and Atrocities of World War II*
  John Wear • 2014 • 167,000 Words

When intellectual freedom is under attack, challenging an officially enshrined mythology may become legally perilous. I have seen claims that thousands of individuals who hold heterodox opinions about various aspects of the history of World War II are today imprisoned across Europe on the basis of those beliefs. If so, that total is probably far higher than the number of ideological dissidents who had suffered

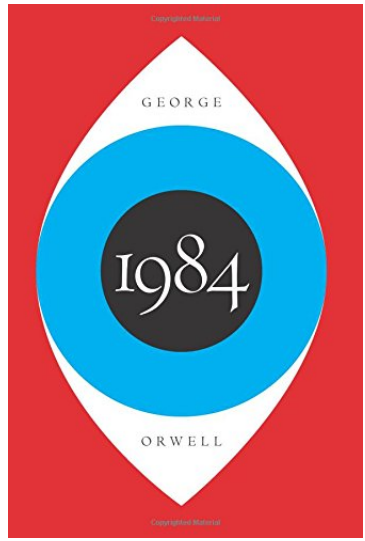
a similar fate in the decaying Soviet Bloc countries of the 1980s.

World War II ended nearly three generations ago, and few of its adult survivors still walk the earth. From one perspective the true facts of that conflict and whether or not they actually contradict our traditional narrative might appear quite irrelevant. Tearing down the statues of some long-dead historical figures and replacing them with the statues of others hardly seems of much practical importance.

But if we gradually conclude that the story that all of us have been told during our entire lifetimes is substantially false and perhaps largely inverted, the implications for our understanding of the world are enormous. Most of the surprising material presented here is hardly hidden or kept under lock-and-key. Nearly all the books are easily available at Amazon or even freely readable on the Internet, many of the authors have received critical and scholarly acclaim, and in some cases their works have sold in the millions. Yet this important material has been almost entirely ignored or dismissed by the popular media that shapes the common beliefs of our society. So we must necessarily begin to wonder what other massive falsehoods may have been similarly promoted by that media, perhaps involving incidents of the recent past or even the present day. And those latter events do have enormous practical significance. As I pointed out several years ago in my original American Pravda article:

> Aside from the evidence of our own senses, almost everything we know about the past or the news of today comes from bits of ink on paper or colored pixels on a screen, and fortunately over the last decade or two the growth of the Internet has vastly widened the range of information available to us in that latter category. Even if the overwhelming majority of the unorthodox claims provided by such non-traditional web-based sources is incorrect, at least there now exists the possibility of extracting vital nuggets of truth from vast mountains of falsehood.

We must also recognize that many of the fundamental ideas that dominate our present-day world were founded upon a particular understanding of that wartime history, and if there seems good reason to believe that narrative is substantially false, perhaps we should begin questioning the framework of beliefs erected upon it.



George Orwell fought in the Spanish Civil War during the 1930s and discovered that the true facts in Spain were radically different from what he had been led to believe by the British media of his day. In 1948 these past experiences together with the rapidly congealing "official history" of the Second World War may have been uppermost in his mind when he published his classic novel 1984, which famously declared that "Who controls the past controls the future; who controls the present controls the past."

Indeed, as I noted last year this observation has never been more true than when we consider some of the historical assumptions that govern the politics of today's world, and the likelihood that they are entirely misleading:

> Back in those late Cold War days, the death toll of innocent civilians from the Bolshevik Revolution and the first two decades of the Soviet Regime was generally reckoned at running well into the tens of millions when we include the casualties of the Russian Civil War, the government-induced famines, the Gulag, and the executions. I've heard that these numbers have been substantially revised downwards to perhaps as little as twenty million or so, but no matter. Although determined Soviet apologists may dispute such very large figures, they have always been part of the standard narrative history taught within the West.
>
> Meanwhile, all historians know perfectly well that the Bolshevik leaders were overwhelmingly Jewish, with three of the five revolutionaries Lenin named as his plausible successors coming from that background. Although only around 4% of Russia's

population was Jewish, a few years ago Vladimir Putin stated that Jews constituted perhaps 80-85% of the early Soviet government, an estimate fully consistent with the contemporaneous claims of Winston Churchill, *Times of London* correspondent Robert Wilton, and the officers of American Military Intelligence. Recent books by Alexander Solzhenitsyn, Yuri Slezkine, and others have all painted a very similar picture. And prior to World War II, Jews remained enormously over-represented in the Communist leadership, especially dominating the Gulag administration and the top ranks of the dreaded NKVD.

Both of these simple facts have been widely accepted in America throughout my entire lifetime. But combine them together with the relatively tiny size of worldwide Jewry, around 16 million prior to World War II, and the inescapable conclusion is that in per capita terms Jews were the greatest mass-murderers of the twentieth century, holding that unfortunate distinction by an enormous margin and with no other nationality coming even remotely close. And yet, by the astonishing alchemy of Hollywood, the greatest killers of the last one hundred years have somehow been transmuted into being seen as the greatest victims, a transformation so seemingly implausible that future generations will surely be left gasping in awe.

Today's American Neocons are just as heavily Jewish as were the Bolsheviks of a hundred years ago, and they have greatly benefited from the political immunity provided by this totally bizarre inversion of historical reality. Partly as a consequence of their media-fabricated victimhood status, they have managed to seize control over much of our political system, especially our foreign policy, and have spent the last few years doing their utmost to foment an absolutely insane war with nuclear-armed Russia. If they do manage to achieve that unfortunate goal, they will surely outdo the very impressive human body-count racked up by their ethnic ancestors, perhaps even by an order-of-magnitude or more.

# Mossad Assassinations

*The JFK Assassination and the 9/11 Attacks?*

January 27, 2020 • 27,300 Words

## From the Peace of Westphalia to the Law of the Jungle

The January 2nd American assassination of Gen. Qassem Soleimani of Iran was an event of enormous moment.

Gen. Soleimani had been the highest-ranking military figure in his nation of 80 million, and with a storied career of 30 years, one of the most universally popular and highly regarded. Most analysts ranked him second in influence only to Ayatollah Ali Khamenei, Iran's elderly Supreme Leader, and there were widespread reports that he was being urged to run for the presidency in the 2021 elections.

The circumstances of his peacetime death were also quite remarkable. His vehicle was incinerated by the missile of an American Reaper drone near Iraq's Baghdad international airport just after he had arrived there on a regular commercial flight for peace negotiations originally suggested by the American government.

Our major media hardly ignored the gravity of this sudden, unexpected killing of so high-ranking a political and military figure, and gave it enormous attention. A day or so later, the front page of my morning *New York Times* was almost entirely filled with coverage of the event and its implications, along with several inside pages devoted to the same topic. Later that same week, America's national newspaper of record allocated more than one-third of all the pages of its front section to the same shocking story.

But even such copious coverage by teams of veteran journalists failed to provide the incident with its proper context and implications. Last year, the Trump Administration had declared the Iranian Revolutionary Guard "a terrorist organization," drawing widespread criticism and even ridicule from national security experts appalled at the notion of classifying a major branch of Iran's armed forces as "terrorists." Gen. Soleimani was a top commander in that body, and this apparently provided the legal fig-leaf for his assassination in

broad daylight while on a diplomatic peace mission.

But note that Congress has been considering legislation declaring Russia an official state sponsor of terrorism, and Stephen Cohen, the eminent Russia scholar, has argued that no foreign leader since the end of World War II has been so massively demonized by the American media as Russian President Vladimir Putin. For years, numerous agitated pundits have denounced Putin as "the new Hitler," and some prominent figures have even called for his overthrow or death. So we are now only a step or two removed from undertaking a public campaign to assassinate the leader of a country whose nuclear arsenal could quickly annihilate the bulk of the American population. Cohen has repeatedly warned that the current danger of global nuclear war may exceed that which we faced during the days of the 1962 Cuban Missile Crisis, and can we entirely dismiss his concerns?

Even if we focus solely upon Gen. Solemaini's killing and entirely disregard its dangerous implications, there seem few modern precedents for the official public assassination of a top-ranking political figure by the forces of another major country. In groping for past examples, the only ones that come to mind occurred almost three generations ago during World War II, when Czech agents assisted by the Allies assassinated Reinhard Heydrich in Prague in 1941 and the US military later shot down the plane of Japanese admiral Isoroku Yamamoto in 1943. But these events occurred in the heat of a brutal global war, and the Allied leadership hardly portrayed them as official government assassinations. Historian David Irving reveals that when one of Adolf Hitler's aides suggested that an attempt be made to assassinate Soviet leaders in that same conflict, the German Fuhrer immediately forbade such practices as obvious violations of the laws of war.

The 1914 terrorist assassination of Archduke Franz Ferdinand, heir to the throne of Austria-Hungary, was certainly organized by fanatical elements of Serbian Intelligence, but the Serbian government fiercely denied its own complicity, and no major European power was ever directly implicated in the plot. The aftermath of the killing soon led to the outbreak of World War I, and although many millions died in the trenches over the next few years, it would have been completely unthinkable for one of the major belligerents to consider assassinating the leadership of another.

A century earlier, the Napoleonic Wars had raged across the entire

continent of Europe for most of a generation, but I don't recall reading of any governmental assassination plots during that era, let alone in the quite gentlemanly wars of the preceding 18th century when Frederick the Great and Maria Theresa disputed ownership of the wealthy province of Silesia by military means. I am hardly a specialist in modern European history, but after the 1648 Peace of Westphalia ended the Thirty Years War and regularized the rules of warfare, no assassination as high-profile as that of Gen. Soleimani comes to mind.

The bloody Wars of Religion during previous centuries did see their share of assassination schemes. For example, I think that Philip II of Spain supposedly encouraged various plots to assassinate Queen Elizabeth I of England on grounds that she was a murderous heretic, and their repeated failure helped persuade him to launch the ill-fated Spanish Armada; but being a pious Catholic, he probably would have balked at using the ruse of peace-negotiations to lure Elizabeth to her doom. In any event, that was more than four centuries ago, so America has now placed itself in rather uncharted waters.

Different peoples possess different political traditions, and this may play a major role in influencing the behavior of the countries they establish. Bolivia and Paraguay were created in the early 18th century as shards from the decaying Spanish Empire, and according to Wikipedia they have experienced nearly three dozen successful coups in their history, the bulk of these prior to 1950, while Mexico has had a half-dozen. By contrast, the U.S. and Canada were founded as Anglo-Saxon settler colonies, and neither history records even a failed attempt.

During our Revolutionary War, George Washington, Thomas Jefferson, and our other Founding Fathers fully recognized that if their effort failed, they would all be hanged as rebels by the British. However, I have never heard that they feared falling to an assassin's blade, nor that King George III ever considered using such an underhanded means of attack. During the first century and more of our nation's history, nearly all our presidents and other top political leaders traced their ancestry back to the British Isles, and political assassinations were exceptionally rare, with Abraham Lincoln's death being one of the very few that comes to mind.

At the height of the Cold War, our CIA did involve itself in various secret assassination plots against Cuba's Communist dictator Fidel Castro and other foreign leaders considered hostile to US interests. But

when these facts later came out in the 1970s, they evoked such enormous outrage from the public and the media, that three consecutive American presidents—Gerald R. Ford, Jimmy Carter, and Ronald Reagan—all issued successive Executive Orders absolutely prohibiting assassinations by the CIA or any other agent of the US government.

Although some cynics might claim that these public declarations represented mere window-dressing, a March 2018 book review in the *New York Times* strongly suggests otherwise. Kenneth M. Pollack spent years as a CIA analyst and National Security Council staffer, then went on to publish a number of influential books on foreign policy and military strategy over the last two decades. He had originally joined the CIA in 1988, and opens his review by declaring:

> One of the very first things I was taught when I joined the CIA was that we do not conduct assassinations. It was drilled into new recruits over and over again.

Yet Pollack notes with dismay that over the last quarter-century, these once solid prohibitions have been steadily eaten away, with the process rapidly accelerating after the 9/11 attacks of 2001. The laws on our books may not have changed, but

> Today, it seems that all that is left of this policy is a euphemism.
>
> We don't call them assassinations anymore. Now, they are ﷺtargeted killings,ﷺ most often performed by drone strike, and they have become America's go-to weapon in the war on terror.

The Bush Administration had conducted 47 of these assassinations-by-another-name, while his successor Barack Obama, a constitutional scholar and Nobel Peace Prize winner, had raised his own total to 542. Not without justification, Pollack wonders whether assassination has become “a very effective drug, but [one that] treats only the symptom and so offers no cure.”

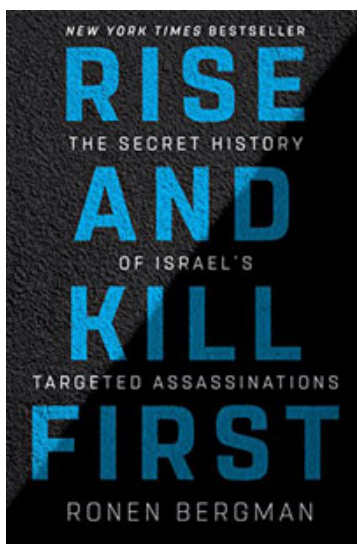
Thus over the last couple of decades American policy has followed a disturbing trajectory in its use of assassination as a tool of foreign policy, first restricting its application only to the most extreme circumstances, next targeting small numbers of high-profile “terrorists” hiding in rough terrain, then escalating those same killings to the many hundreds. And now under President Trump, the fateful step has been taken of America claiming the right to assassinate any world leader not to our liking whom we unilaterally declare worthy of

death.

Pollack had made his career as a Clinton Democrat, and is best known for his 2002 book *The Threatening Storm* that strongly endorsed President Bush's proposed invasion of Iraq and was enormously influential in producing bipartisan support for that ill-fated policy. I have no doubt that he is a committed supporter of Israel, and he probably falls into a category that I would loosely describe as "Left Neocon."

But while reviewing a history of Israel's own long use of assassination as a mainstay of its national security policy, he seems deeply disturbed that America might now be following along that same terrible path. Less than two years later, our sudden assassination of a top Iranian leader demonstrates that his fears may have been greatly understated.

## "Rise and Kill First"



The book reviewed by Pollack was *Rise and Kill First* by *New York Times* reporter Ronen Bergman, a weighty study of the Mossad, Israel's foreign intelligence service, together with its sister agencies. The author devoted six years of research to the project, which was based upon a thousand personal interviews and access to an enormous number of official documents previously unavailable. As suggested by the title, his primary focus was Israel's long history of assassinations, and across his 750 pages and thousand-odd source references he recounts the details of an enormous number of such incidents.

That sort of topic is obviously fraught with controversy, but Bergman's volume carries glowing cover-blurbs from Pulitzer Prize-winning authors on espionage matters, and the official cooperation he received is indicated by similar endorsements from both a former Mossad chief and Ehud Barak, a past Prime Minister of Israel who himself had once led assassination squads. Over the last couple of decades, former CIA officer Robert Baer has become one of our most prominent authors in this same field, and he praises the book as "hands down" the best he has ever read on intelligence, Israel, or the Middle East. The reviews across our elite media were equally laudatory.

Although I had seen some discussions of the book when it appeared, I only got around to reading it a few months ago. And while I was deeply impressed by the thorough and meticulous journalism, I found the pages rather grim and depressing reading, with their endless accounts of Israeli agents killing their real or perceived enemies in operations that sometimes involved kidnappings and brutal torture, or resulted in considerable loss of life to innocent bystanders. Although the overwhelming majority of the attacks described took place in the various countries of the Middle East or the occupied Palestinian territories of the West Bank and Gaza, others ranged across the world, including Europe. The narrative history began in the 1920s, decades before the actual creation of the Jewish state or its Mossad organization, and extended down to the present day.

The sheer quantity of such foreign assassinations was really quite remarkable, with the knowledgeable reviewer in the *New York Times* suggesting that the Israeli total over the last half-century or so seemed far greater than that of any other nation. I might even go farther: if we excluded domestic killings, I wouldn't be surprised if Israel's body-count greatly exceeded the combined total for that of all other major countries in the world. I think all the lurid revelations of lethal CIA or KGB Cold War assassination plots that I have seen discussed in newspaper articles might fit comfortably into just a chapter or two of Bergman's extremely long book.

National militaries have always been nervous about deploying biological weapons, knowing full well that once released, the deadly microbes might easily spread back across the border and inflict great suffering upon the civilians of the country that deployed them. Similarly, intelligence operatives who have spent their long careers so heavily focused upon planning, organizing, and implementing what amount to officially-sanctioned murders may develop ways of thinking that become a danger both to each other and to the larger society they serve, and some examples of this possibility leak out here and there in

Bergman's comprehensive narrative.

In the so-called "Askelon Incident" of 1984, a couple of captured Palestinians were beaten to death in public by the notoriously ruthless head of the Shin Bet domestic security agency and his subordinates. Under normal circumstances, this deed would have carried no consequences, but the incident happened to be captured by the camera by a nearby Israeli photo-journalist, who managed to avoid confiscation of his film. His resulting scoop sparked an international media scandal, even reaching the pages of the *New York Times*, and this forced a governmental investigation aimed at criminal prosecution. To protect themselves, the Shin Bet leadership infiltrated the inquiry and organized an effort to fabricate evidence pinning the murders upon ordinary Israeli soldiers and a leading general, all of whom were completely innocent. A senior Shin Bet officer who expressed misgivings about this plot apparently came close to being murdered by his colleagues until he agreed to falsify his official testimony. Organizations that increasingly operate like mafia crime families may eventually adopt similar cultural norms.

Israeli operatives sometimes even contemplated the elimination of their own top-ranking leaders whose policies they viewed as sufficiently counter-productive. For decades, Gen. Ariel Sharon had been one of Israel's greatest military heroes and someone of extreme right-wing sentiments. As Defense Minister in 1982, he orchestrated the Israeli invasion of Lebanon, which soon turned into a major political debacle, seriously damaging Israel's international standing by inflicting great destruction upon that neighboring country and its capital city of Beirut. As Sharon stubbornly continued his military strategy and the problems grew more severe, a group of disgruntled officers decided that the best means of cutting Israel's losses was to assassinate Sharon, though that proposal was never carried out.

An even more striking example occurred a decade later. For many years, Palestinian leader Yasir Arafat had been the leading object of Israeli antipathy, so much so that at one point Israel made plans to shoot down an international civilian jetliner in order to assassinate him. But after the end of the Cold War, pressure from America and Europe led Prime Minister Yitzhak Rabin to sign the 1993 Oslo Peace Accords with his Palestinian foe. Although the Israeli leader received worldwide praise and shared a Nobel Peace Prize for his peacemaking efforts, powerful segments of the Israeli public and its political class regarded the act as a betrayal, with some extreme nationalists and religious zealots demanding that he be killed for his treason. A couple of years later, he was indeed shot dead by a lone gunman from those

ideological circles, becoming the first Middle Eastern leader in decades to suffer that fate. Although his killer was mentally unbalanced and stubbornly insisted that he acted alone, he had had a long history of intelligence associations, and Bergman delicately notes that the gunman slipped past Rabin's numerous bodyguards "with astonishing ease" in order to fire his three fatal shots at close range.

Many observers drew parallels between Rabin's assassination and that of our own president in Dallas three decades earlier, and the latter's heir and namesake, John F. Kennedy, Jr., developed a strong personal interest in the tragic event. In March 1997, his glossy political magazine *George* published an article by the Israeli assassin's mother, implicating her own country's security services in the crime, a theory also promoted by the late Israeli-Canadian writer Barry Chamish. These accusations sparked a furious international debate, but after Kennedy himself died in an unusual plane crash a couple of years later and his magazine quickly folded, the controversy soon subsided. The *George* archives are not online nor easily available, so I cannot easily judge the credibility of the charges.

Having himself narrowly avoided assassination by Israeli operatives, Sharon gradually regained his political influence, and did so without compromising his hard-line views, even boastfully describing himself as a "Judeo-Nazi" to an appalled journalist. A few years after Rabin's death, he provoked major Palestinian protests, then used the resulting violence to win election as Prime Minister, and once in office, his very harsh methods led to a widespread uprising in Occupied Palestine. But Sharon merely redoubled his repression, and after world attention was diverted by 9/11 attacks and the American invasion of Iraq, he began assassinating numerous top Palestinian political and religious leaders in attacks that sometimes inflicted heavy civilian casualties.

The central object of Sharon's anger was Palestine President Yasir Arafat, who suddenly took ill and died, thereby joining his erstwhile negotiating partner Rabin in permanent repose. Arafat's wife claimed that he had been poisoned and produced some medical evidence to support this charge, while longtime Israeli political figure Uri Avnery published numerous articles substantiating those accusations. Bergman simply reports the categorical Israeli denials while noting that "the timing of Arafat's death was quite peculiar," then emphasizes that even if he knew the truth, he couldn't publish it since his entire book was written under strict Israeli censorship.

This last point seems an extremely important one, and although it only appears just that one time in the body of the text, the disclaimer obviously applies to the entirety of the long volume and should always be kept in the back of our minds. Bergman's book runs some 350,000 words and even if every single sentence were written with the most scrupulous honesty, we must recognize the huge difference between "the Truth" and "the Whole Truth."

Another item also raised my suspicions. Thirty years ago, a disaffected Mossad officer named Victor Ostrovsky left that organization and wrote *By Way of Deception*, a highly critical book recounting numerous alleged operations known to him, especially those contrary to American and Western interests. The Israeli government and its pro-Israel advocates launched an unprecedented legal campaign to block publication, but this produced a major backlash and media uproar, with the heavy publicity landing the book as #1 on the *New York Times* bestseller list. I finally got around to reading his book about a decade ago and was shocked by many of the remarkable claims, while being reliably informed that CIA personnel had judged his material as probably accurate when they reviewed it.

Although much of Ostrovsky's information was impossible to independently confirm, for more than a quarter-century his international bestseller and its 1994 sequel *The Other Side of Deception* have heavily shaped our understanding of Mossad and its activities, so I naturally expected to see a detailed discussion, whether supportive or critical, in Bergman's exhaustive parallel work. Instead, there was only a single reference to Ostrovsky buried in a footnote on p. 684. We are told of Mossad's utter horror at the numerous deep secrets that Ostrovsky was preparing to reveal, which led its top leadership to formulate a plan to assassinate him. Ostrovsky only survived because Prime Minister Yitzhak Shamir, who had formerly spent decades as the Mossad assassination chief, vetoed the proposal on the grounds that "We don't kill Jews." Although this reference is brief and almost hidden, I regard it as providing considerable support for Ostrovsky's general credibility.

Having thus acquired serious doubts about the completeness of Bergman's seemingly comprehensive narrative history, I noted a curious fact. I have no specialized expertise in intelligence operations in general nor those of Mossad in particular, so I found it quite remarkable that the overwhelming majority of all the higher-profile incidents recounted by Bergman were already familiar to me merely from the decades I had spent closely reading the *New York Times* every morning. Is it really plausible that six years of exhaustive research

and so many personal interviews would have uncovered so few major operations that had not already been known and reported in the international media? Bergman obviously provides a wealth of detail previously limited to insiders, along with numerous unreported assassinations of relatively minor individuals, but it seems strange that he came up with so few major new revelations.

Indeed, some major gaps in his coverage are quite apparent to anyone who has even somewhat investigated the topic, and these begin in the early chapters of his volume, which include coverage of the Zionist prehistory in Palestine prior to the establishment of the Jewish state.

Bergman would have severely damaged his credibility if he had failed to include the infamous 1940s Zionist assassinations of Britain's Lord Moyne or U.N. Peace Negotiator Count Folke Bernadotte. But he unaccountably fails to mention that in 1937 the more right-wing Zionist faction whose political heirs have dominated Israel in recent decades assassinated Chaim Arlosoroff, the highest-ranking Zionist figure in Palestine. Moreover, he omits a number of similar incidents, including some of those targeting top Western leaders. As I wrote last year:

> Indeed, the inclination of the more right-wing Zionist factions toward assassination, terrorism, and other forms of essentially criminal behavior was really quite remarkable. For example, in 1943 Shamir had arranged the assassination of his factional rival, a year after the two men had escaped together from imprisonment for a bank robbery in which bystanders had been killed, and he claimed he had acted to avert the planned assassination of David Ben-Gurion, the top Zionist leader and Israel's future founding-premier. Shamir and his faction certainly continued this sort of behavior into the 1940s, successfully assassinating Lord Moyne, the British Minister for the Middle East, and Count Folke Bernadotte, the UN Peace Negotiator, though they failed in their other attempts to kill American President Harry Truman and British Foreign Minister Ernest Bevin, and their plans to assassinate Winston Churchill apparently never moved past the discussion stage. His group also pioneered the use of terrorist car-bombs and other explosive attacks against innocent civilian targets, all long before any Arabs or Muslims had ever thought of using similar tactics; and Begin's larger and more "moderate" Zionist faction did much the same.

As far as I know, the early Zionists had a record of political terrorism almost unmatched in world history, and in 1974 Prime Minister

Menachem Begin once even boasted to a television interviewer of having been the founding father of terrorism across the world.

In the aftermath of World War II, Zionists were bitterly hostile towards all Germans, and Bergman describes the campaign of kidnappings and murders they soon unleashed, both in parts of Europe and in Palestine, which claimed as many as two hundred lives. A small ethnic German community had lived peacefully in the Holy Land for many generations, but after some of its leading figures were killed, the rest permanently fled the country, and their abandoned property was seized by Zionist organizations, a pattern which would soon be replicated on a vastly larger scale with regard to the Palestinian Arabs.

These facts were new to me, and Bergman seemingly treats this wave of vengeance-killings with considerable sympathy, noting that many of the victims had actively supported the German war effort. But oddly enough, he fails to mention that throughout the 1930s, the main Zionist movement had itself maintained a strong economic partnership with Hitler's Germany, whose financial support was crucial to the establishment of the Jewish state. Moreover, after the war began a small right-wing Zionist faction led by a future prime minister of Israel actually attempted to enlist in the Axis military alliance, offering to undertake a campaign of espionage and terrorism against the British military in support of the Nazi war effort. These undeniable historical facts have obviously been a source of immense embarrassment to Zionist partisans, and over the last few decades they have done their utmost to expunge them from public awareness, so as a native-born Israeli now in his mid-40s, Bergman may simply be unaware of this reality.

## "Who Killed Zia?"

Bergman's long book contains thirty-five chapters of which only the first two cover the period prior to the creation of Israel, and if his notable omissions were limited to those, they would constitute a mere blemish on an otherwise reliable historical narrative. But a considerable number of major lacunae seem evident across the decades that follow, though they may be less the fault of the author himself than the tight Israeli censorship he faced or the realities of the American publishing industry. By the year 2018, pro-Israeli influence over America and other Western countries had reached such enormous proportions that Israel would risk little international damage by admitting to numerous illegal assassinations of various prominent

figures in the Arab world or the Middle East. But other sorts of past deeds might still be considered far too damaging to yet acknowledge.

In 1991 renowned investigative journalist Seymour Hersh published *The Samson Option*, describing Israel's secret nuclear weapons development program of the early 1960s, which was regarded as an absolute national priority by Prime Minister David Ben-Gurion, There are widespread claims that it was the threatened use of that arsenal that later blackmailed the Nixon Administration into its all-out effort to rescue Israel from the brink of military defeat during the 1973 war, a decision that provoked the Arab Oil Embargo and led to many years of economic hardship for the West.

The Islamic world quickly recognized the strategic imbalance produced by their lack of nuclear deterrent capability, and various efforts were made to redress that balance, which Tel Aviv did its utmost to frustrate. Bergman covers in great detail the widespread campaigns of espionage, sabotage, and assassination by which the Israelis successfully forestalled the Iraqi nuclear program of Saddam Hussein, finally culminating in the long-distance 1981 air raid that destroyed his Osirik reactor complex. The author also covers the destruction of a Syrian nuclear reactor in 2007 and Mossad's assassination campaign that claimed the lives of several leading Iranian physicists a few years later. But all these events were reported at the time in our major newspapers, so no new ground is being broken. Meanwhile, an important story not widely known is entirely missing.

About seven months ago, my morning *New York Times* carried a glowing 1,500 word tribute to former U.S. ambassador John Gunther Dean, dead at age 93, giving that eminent diplomat the sort of lengthy obituary usually reserved these days for a rap-star slain in a gun-battle with his drug-dealer. Dean's father had been a leader of his local Jewish community in Germany, and after the family left for America on the eve of World War II, Dean became a naturalized citizen in 1944. He went on to have a very distinguished diplomatic career, notably serving during the Fall of Cambodia, and under normal circumstances, the piece would have meant no more to me than it did to nearly all its other readers. But I had spent much of the first decade of the 2000s digitizing the complete archives of hundreds of our leading periodicals, and every now and then a particularly intriguing title led me to read the article in question. Such was the case with "Who Killed Zia?" which appeared in 2005.

Throughout the 1980s, Pakistan had been the lynchpin of America's

opposition to the Soviet occupation of Afghanistan, with its military dictator Zia ul-Haq being one of our most important regional allies. Then in 1988, he and most of his top leadership died in a mysterious plane crash, which also claimed the lives of the U.S. ambassador and an American general.

Although the deaths might have been accidental, Zia's wide assortment of bitter enemies led most observers to assume foul play, and there was some evidence that a nerve gas agent, possibly released from a crate of mangos, had been used to incapacitate the crew and thereby cause the crash.

At the time, Dean had reached the pinnacle of his career, serving as our ambassador in neighboring India, while the U.S. ambassador killed in the crash, Arnold Raphel, had been his closest personal friend, also Jewish. By 2005, Dean was elderly and long-retired, and he finally decided to break his seventeen years of silence and reveal the strange circumstances surrounding the event, saying that he was convinced that the Israeli Mossad had been responsible.

A few years before his death, Zia had boldly declared that the production of an "Islamic atomic bomb" was a top Pakistani priority. Although his primary motive was the need to balance India's small nuclear arsenal, he promised to share such powerful weapons with other Muslim countries, including those in the Middle East. Dean describes the tremendous alarm Israel expressed at this possibility, and how pro-Israel members of Congress began a fierce lobbying campaign to stop Zia's efforts. According to journalist Eric Margolis, a leading expert on South Asia, Israel repeatedly tried to enlist India in launching a joint all-out attack against Pakistan's nuclear facilities, but after carefully considering the possibility, the Indian government declined.

This left Israel in a quandary. Zia was a proud and powerful military dictator and his very close ties with the U.S. greatly strengthened his diplomatic leverage. Moreover, Pakistan was 2,000 miles from Israel and possessed a strong military, so that any sort of long-distance bombing raid similar to the one used against the Iraqi nuclear program was impossible. That left assassination as the remaining option.

Given Dean's awareness of the diplomatic atmosphere prior to Zia's death, he immediately suspected an Israeli hand, and his past personal experiences supported that possibility. Eight years earlier, while posted in Lebanon, the Israelis had sought to enlist his personal

support in their local projects, drawing upon his sympathy as a fellow Jew. But when he rejected those overtures and declared that his primary loyalty was to America, an attempt was made to assassinate him, with the munitions used being eventually traced back to Israel.

Although Dean was tempted to immediately disclose his strong suspicions regarding the annihilation of the Pakistani government to the international media, he decided instead to pursue proper diplomatic channels, and immediately departed for Washington to share his views with his State Department superiors and other top Administration officials. But upon reaching DC, he was quickly declared mentally incompetent, prevented from returning to his India posting, and soon forced to resign. His four decade long career in government service ended summarily at that point. Meanwhile, the US government refused to assist Pakistan's efforts to properly investigate the fatal crash and instead tried to convince a skeptical world that Pakistan's entire top leadership had died because of a simple mechanical failure in their American aircraft.

This remarkable account would surely seem like the plot of an implausible Hollywood movie, but the sources were extremely reputable. The author of the 5,000 word article was Barbara Crossette, the former *New York Times* bureau chief for South Asia, who had held that post at the time of Zia's death, while the piece appeared in *World Policy Journal*, the prestigious quarterly of The New School in New York City. The publisher was academic Stephen Schlesinger, son of famed historian Arthur J. Schlesinger, Jr.

One might naturally expect that such explosive charges from so solid a source might provoke considerable press attention, but Margolis noted that the story was instead totally ignored and boycotted by the entire North American media. Schlesinger had spent a decade at the helm of his periodical, but a couple of issues later he had vanished from the masthead and his employment at the New School had come to an end. The article is no longer available on the *World Policy Journal* website, but the text can still be accessed via Archive.org, allowing those so interested to read it and decide for themselves.

The complete historical blackout of that incident has continued down to the present day. Dean's detailed *Times* obituary portrayed his long and distinguished career in highly flattering terms, yet failed to devote even a single sentence to the bizarre circumstances under which it ended.

At the time I originally read that article a dozen or so years ago, I had

mixed feelings about the likelihood of Dean's provocative hypothesis. Top national leaders in South Asia do die by assassination rather regularly, but the means employed are almost always quite crude, usually involving one or more gunman firing at close range or perhaps a suicide-bomber. By contrast, the highly sophisticated methods apparently used to eliminate the Pakistani government seemed to suggest a very different sort of state actor. Bergman's book catalogs the enormous number and variety of Mossad's assassination technologies.

Given the important nature of Dean's accusations and the highly reputable venue in which they had appeared, Bergman must certainly have been aware of the story, so I wondered what arguments his Mossad sources might provide to rebut or debunk them. Instead, I discovered that the incident appears nowhere in Bergman's exhaustive volume, perhaps reflecting the author's reluctance to assist in deceiving his readers.

I also noticed that Bergman made absolutely no mention of the earlier assassination attempt against Dean when he was serving as our ambassador in Lebanon, even though the serial numbers of the anti-tank rockets fired at his armored limousine were traced to a batch sold to Israel. However, sharp-eyed journalist Philip Weiss did notice that the shadowy organization which officially claimed credit for the attack was revealed by Bergman to have been a Israel-created front group used for numerous car-bombings and other terrorist attacks. This seems to confirm Israel's responsibility in the assassination plot.

Let us assume that this analysis is correct and that there is a good likelihood that Mossad was indeed behind Zia's death. The broader implications are considerable.

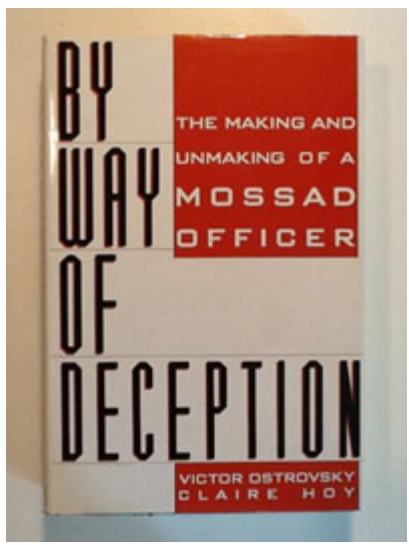
Pakistan was one of the world's largest countries in 1988, having a population that was already over 100 million and growing rapidly, while also possessing a powerful military. One of America's main Cold War projects had been to defeat the Soviets in Afghanistan, and Pakistan had played the central role in that effort, ranking its leadership as one of our most important global allies. The sudden assassination of President Zia and most of his pro-American government, along with our own ambassador, thus represented a huge potential blow to U.S. interests. Yet when one of our top diplomats reported Mossad as the likely culprit, the whistleblower was immediately purged and a major cover-up begun, with no whisper of the story ever reaching our media or our citizenry, even after he repeated the charges years later in a prestigious publication.

Bergman's comprehensive book contains no hint of the story, and none of the knowledgeable reviewers seem to have noted this lapse.

If an event of such magnitude could be totally ignored by our entire media and omitted from Bergman's book, many other important incidents may also have escaped notice.

## "By Way of Deception"

A good starting point for such investigation might be Ostrovsky's works, given the desperate concern of the Mossad leadership at the secrets he revealed in his manuscript and their hopes of shutting his mouth by killing him. So I decided to reread his work after a decade or so and with Bergman's material now reasonably fresh in my mind.



Ostrovsky's 1990 book runs just a fraction of the length of Bergman's volume and is written in a far more casual style while totally lacking any of the latter's copious source references. Much of the text is simply a personal narrative, and although both he and Bergman had Mossad as their subject, his overwhelming focus was on espionage issues and the techniques of spycraft rather than the details of particular assassinations, although a certain number of the latter were included. On an entirely impressionistic level, the style of the Mossad operations described seemed quite similar to those presented by Bergman, so much so that if various incidents were switched between the two books, I doubt that anyone could easily tell the difference.

In assessing Ostrovsky's credibility, a couple of minor items caught my eye. Early on, he states that at the age of 14 he placed second in Israel in target shooting and at 18 he was commissioned as the youngest officer in the Israeli military. These seem like significant, factual claims, which if true would help to explain the repeated efforts by Mossad to recruit him, while if false would surely have been used by Israel's partisans to discredit him as a liar. I have seen no indication that his statements were ever disputed.

Mossad assassinations were a relatively minor focus of Ostrovsky's 1990 book, but it is interesting to compare those handful of examples to the many hundreds of lethal incidents covered by Bergman. Some of the differences in detail and coverage seem to follow a pattern.

For example, Ostrovsky's opening chapter described the subtle means by which Israel pierced the security of Saddam Hussein's nuclear weapons project of the late 1970s, successfully sabotaging his equipment, assassinating his scientists, and eventually destroying the completed reactor in a daring 1981 bombing raid. As part of this effort, they lured one of his top physicists to Paris, and after failing to recruit the scientist, killed him instead. Bergman devotes a page or two to that same incident, but fails to mention that the French prostitute who had unwittingly been part of their scheme was also killed the following month after she became fearful at what had happened and contacted the police. One wonders if numerous other collateral killings of Europeans and Americans accidentally caught up in these deadly events may also have been carefully airbrushed out of Bergman's Mossad-sourced narrative.

An even more obvious example comes much later in Ostrovsky's book, when he describes how Mossad became alarmed upon discovering that Arafat was attempting to open peace negotiations with Israel in 1981, and soon assassinated the ranking PLO official assigned to that task. This incident is missing from Bergman's book, despite its comprehensive catalog of far less significant Mossad victims.

One of the most notorious assassinations on American soil occurred in 1976, when a car-bomb explosion in the heart of Washington D.C. took the lives of exiled former Chilean Foreign Minister Orlando Letelier and his young American assistant. The Chilean secret service were soon found responsible, and a major international scandal erupted, especially since the Chileans had already begun liquidating numerous other perceived opponents throughout Latin America. Ostrovsky explains how Mossad had trained the Chileans in such assassination techniques as part of a complex arms sale agreement,

but Bergman makes no mention of this history.

One of the leading Mossad figures in Bergman's narrative is Mike Harari, who spent some fifteen years holding senior positions in its assassination division, and according to the index his name appears on more than 50 different pages. The author generally portrays Harari in a gauzy light, while admitting his central role in the infamous Lillehammer Affair, in which his agents killed a totally innocent Moroccan waiter living in a Norwegian town through a case of mistaken identity, a murder that resulted in the conviction and imprisonment of several Mossad agents and severe damage to Israel's international reputation. By contrast, Ostrovsky portrays Harari as a deeply corrupt individual, who after his retirement became heavily involved in international drug-dealing and served as a top henchman of notorious Panamanian dictator Manuel Noriega. After Noriega fell, the new American-backed government gleefully announced Harari's arrest, but the ex-Mossad officer somehow managed to escape back to Israel, while his former boss received a thirty year sentence in American federal prison.

Widespread financial and sexual impropriety within the Mossad hierarchy was a recurrent theme throughout Ostrovsky's narrative, and his stories seem fairly credible. Israel had been founded on strict socialistic principles and these still held sway during the 1980s, so that government employees were usually paid a mere pittance. For example, Mossad case officers earned between $500 and $1,500 per month depending upon their rank, while controlling vastly larger operational budgets and making decisions potentially worth millions to interested parties, a situation that obviously might lead to serious temptations. Ostrovsky notes that although one of his superiors had spent his whole career working for the government on that sort of meager salary, he had somehow managed to acquire a huge personal estate, complete with its own small forest. My own impression is that although intelligence operatives in America may often launch lucrative private careers after they retire, any agents who became conspicuously wealthy while still working for the CIA would be facing serious legal risk.

Ostrovsky was also disturbed by the other sorts of impropriety he claims to have encountered. He and his fellow trainees allegedly discovered that their top leadership sometimes staged late-night sexual orgies in the secure areas of the official training facilities, while adultery was rampant within Mossad, especially involving supervising officers and the wives of the agents they had in the field. Moderate former Prime Minister Yitzhak Rabin was widely disliked in the

organization and one Mossad officer regularly bragged that he had personally brought down Rabin's government in 1976 by publicizing a minor violation of financial regulations. This foreshadows Bergman's far more serious suggestion of the very suspicious circumstances behind Rabin's assassination two decades later.

Ostrovsky emphasized the remarkable nature of Mossad as an organization, especially when compared to its late Cold War peers serving the two superpowers. The KGB had 250,000 worldwide employees and the CIA tens of thousands, but Mossad's entire staff barely numbered 1,200, including secretaries and cleaning personnel. While the KGB deployed an army of 15,000 case officers, Mossad operated with merely 30 to 35.

This astonishing efficiency was made possible by Mossad's heavy reliance on a huge network of loyal Jewish volunteer "helpers" or *sayanim* scattered all across the world, who could be called upon at a moment's notice to assist in an espionage or assassination operation, immediately lend large sums of money, or provide safe houses, offices, or equipment. London alone contained some 7,000 of these individuals, with the worldwide total surely numbering in the many tens or even hundreds of thousands. Only full-blooded Jews were considered eligible for this role, and Ostrovsky expresses considerable misgivings about a system that seemed so strongly to confirm every traditional accusation that Jews functioned as a "state within a state," with so many of them being disloyal to the country in which they held their citizenship. Meanwhile, the term *sayanim* appears nowhere in Bergman's 27 page index, and there is almost no mention of their use in his text, although Ostrovsky plausibly argues that the system was absolutely central to Mossad's operational efficiency.

Ostrovsky also starkly portrays the utter contempt that many Mossad officers expressed toward their purported allies in the other Western intelligence services, trying to cheat their supposed partners at every turn and taking as much as they could get while giving as little as possible in return. He describes what seems like a remarkable degree of outright hatred, almost xenophobia, towards all non-Jews and their leaders, however friendly. For example, Margaret Thatcher was widely regarded as one of the most pro-Jewish and pro-Israel prime ministers in British history, filling her cabinet with members of that tiny 0.5% minority and regularly praising plucky little Israel as a rare Middle Eastern democracy. Yet the Mossad members deeply hated her, usually referred to her as "the bitch," and were convinced that

she was an anti-Semite.

If European Gentiles were regular objects of hatred, peoples from other, less developed parts of the world were often ridiculed in harshly racialist terms, with Israel's Third World allies sometimes casually described as "monkeylike" and "not long out of the trees."

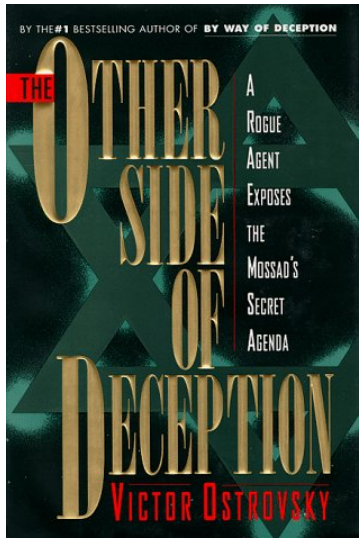
Occasionally, such extreme arrogance risked diplomatic disaster as was suggested by an amusing vignette. During the 1980s, there was a bitter civil war in Sri Lanka between the Sinhalese and the Tamils, which also drew in a military contingent from neighboring India. At one point, Mossad was simultaneously training special forces contingents from all three of these mutually-hostile forces at the same time and in the same facility, so that they nearly encountered each other, which surely would have produced a huge diplomatic black eye for Israel.

The author describes his increasing disillusionment with an organization that he claimed was subject to rampant internal factionalism and dishonesty. He was also increasingly concerned about the extreme right-wing sentiments that seemed to pervade so much of Mossad, leading him to wonder if it wasn't becoming a serious threat to Israeli democracy and the very survival of the country. According to his account, he was unfairly made the scapegoat for a failed mission and believing his life at risk, he fled Israel with his wife and returned to his birthplace of Canada.

After deciding to write his book, Ostrovsky recruited as his co-author Claire Hoy, a prominent Canadian political journalist, and despite tremendous pressure from Israel and its partisans, their project succeeded, with the book becoming a huge international best-seller, spending nine weeks as #1 on the *New York Times* list and soon having over a million copies in print.

Although Hoy had spent 25 years as a highly successful writer and this book project was by far his greatest publishing triumph, not long afterwards he was financially bankrupt and the butt of widespread media ridicule, having suffered the sort of personal misfortune that so often seems to visit those who are critical of Israel or Jewish activities. Perhaps as a consequence, when Ostrovsky published his 1994 sequel, *The Other Side of Deception*, no co-author was listed.

## "The Other Side of Deception"



BY THE #1 BESTSELLING AUTHOR OF BY WAY OF DECEPTION
THE OTHER SIDE OF DECEPTION
A ROGUE AGENT EXPOSES THE MOSSAD'S SECRET AGENDA
VICTOR OSTROVSKY

The contents of Ostrovsky's first book had mostly been rather mundane, lacking any shocking revelations. He merely described the inner workings of Mossad and recounted some of its major operations, thereby piercing the veil of secrecy that had long shrouded one of the world's most effective intelligence services. But having established his reputation with an international bestseller, the author felt confident enough to include numerous bombshells in his 1994 sequel, so that individual readers must decide for themselves whether these were factual or merely a product of his wild imagination. Bergman's comprehensive bibliography lists some 350 titles, but although Ostrovsky's first book is included, his second is not.

Portions of Ostrovsky's original narrative had certainly struck me as rather vague and odd. Why had he supposedly been scapegoated for a failed mission and drummed out of the service? And since he had left Mossad in early 1986 but only began work on his book two years later, I wondered what he had been doing during the intervening period. I also found it difficult to understand how a rather junior officer had obtained such a wealth of detailed information about Mossad operations in which he himself had not been personally involved. There seemed many missing pieces to the story.

These explanations were all supplied in the opening portions of his sequel, though they are obviously impossible to verify. According to the author, his departure had occurred as a byproduct of an ongoing internal struggle at Mossad, in which a moderate dissident faction intended to use him to undermine the credibility of the organization and thereby weaken its dominant leadership, whose policies they opposed.

Reading this second book eight or nine years ago, one of the earliest claims seemed totally outlandish. Apparently, the director of Mossad had traditionally been an outsider appointed by the prime minister, and that policy had long rankled many of its senior figures, who preferred to see one of their own put in charge. In 1982, their furious lobbying for such an internal promotion had once again been ignored, and instead a celebrated Israeli general had been named, who soon made plans to clean house in support of different policies. But instead of accepting this situation, some disgruntled Mossad elements arranged his assassination in Lebanon just before he was scheduled to officially take office. Some evidence of the successful plot immediately came to light and was later confirmed, igniting a subterranean factional conflict involving both Mossad personnel and some members of the military, a struggle that ultimately drew in Ostrovsky.

This story came towards the beginning of the book, and struck me as so wildly implausible that I became deeply suspicious of everything that followed. But after reading Bergman's authoritative volume, I am now not so sure. After all, we know that around the same time, a different intelligence faction had seriously considered assassinating Israel's defense minister, and there are strong suspicions that security operatives orchestrated the later assassination of Prime Minister Rabin. So perhaps the elimination of a disfavored Mossad director-designate is not so totally absurd. And Wikipedia does indeed confirm that Gen. Yekutiel Adam, Israel's Deputy Chief of Staff, was named Mossad Director in mid-1982 but then killed in Lebanon just a couple of weeks before he was scheduled to take office, thereby becoming the highest-ranking Israeli ever to die on the battlefield.

According to Ostrovsky and his factional allies, powerful elements within Mossad were transforming it into a dangerous, rogue organization, which threatened Israeli democracy and blocked any possibility of peace with the Palestinians. These individuals might even act in direct opposition to the top Mossad leadership, whom they often regarded as overly weak and compromising.

Early in 1982, some of the more moderate Mossad elements backed by the outgoing director had tasked one of their officers in Paris to open diplomatic channels with the Palestinians, and he did so via an American attache whom he enlisted in the effort. But when the harder-line faction discovered this plan, they frustrated the project by assassinating both the Mossad agent and his unlucky American collaborator, while throwing the blame upon some extremist Palestinian group. I obviously can't verify the truth of this remarkable

story, but the *New York Times* archive does confirm Ostrovsky's account of the mysterious 1982 killings of Yakov Barsimantov and Charles Robert Ray, puzzling incidents that left experts searching for a motive.

Ostrovsky claims to have been deeply shocked and disbelieving when he was initially informed of this history of hard-line Mossad elements assassinating both Israeli officials and their own colleagues over policy differences, but he was gradually persuaded of the reality. So as a private citizen now living in Canada, he agreed to undertake a campaign to disrupt Mossad's existing intelligence operations, hoping to sufficiently discredit the organization that the dominant faction would lose influence or at least have their dangerous activities curtailed by the Israeli government. Although he would receive some assistance by the moderate elements that had recruited him, the project was obviously an extremely dangerous one, with his life very much at risk if his actions were discovered.

Presenting himself as a disgruntled former Mossad officer who was seeking revenge against his past employer, he spent much of the next year or two approaching the intelligence services of Britain, France, Jordan, and Egypt, offering to assist them in uncovering the Israeli espionage networks in their countries in exchange for substantial financial payments. No similarly knowledgeable Mossad defector had ever previously come forward, and although some of these services were initially suspicious, he eventually won their trust, while the information he provided was quite valuable in breaking up various local Israeli spy-rings, most of which had previously been unsuspected. Meanwhile, his Mossad confederates kept him informed of any signs that his activities had been detected.

The detailed account of Ostrovsky's anti-Mossad counter-intelligence campaign occupies well over half the book, and I have no easy means of determining whether his stories are real or fantasy, or perhaps some mixture of the two. The author does provide copies of his 1986 plane tickets to Amman, Jordan and Cairo, Egypt, where supposedly he was debriefed at length by the local security services, and in 1988 a major international scandal did erupt when the British very publicly closed down a large number of Mossad safe-houses and expelled numerous Israeli agents. Personally, I found most of Ostrovsky's account reasonably credible, but perhaps individuals who possess actual professional expertise in intelligence operations might come to a different conclusion.

Although two years of these attacks against Mossad intelligence networks had inflicted serious damage, the overall political results were much less than desired. The existing leadership still held a firm grip on the organization and the Israeli government gave no sign of taking action. So Ostrovsky finally concluded that a different approach might be more effective, and he decided to write a book about Mossad and its inner workings.

His internal allies were initially quite skeptical, but he eventually won them over, and they fully participated in the writing project. Some of these individuals had spent many years at Mossad, even rising to a senior level, and they were the source of the extremely detailed material on particular operations in the 1990 book, which had seemed far beyond the knowledge of a very junior officer such as Ostrovsky.

Mossad's attempt to legally suppress the book was a terrible blunder and generated the massive publicity that made it an international bestseller. Outside observers were mystified that the Israelis had adopted such a counter-productive media strategy, but according to Ostrovsky, his internal allies had helped persuade the Mossad leadership to take that approach. They also tried to keep him abreast of any Mossad plans to abduct or assassinate him.

During the production of the 1990 book, Ostrovsky and his allies had discussed numerous past operations, but only a fraction of these were ultimately included in the text. So when the author decided to produce his sequel, he had a wealth of historical material to draw upon, which included several bombshells.

The first of these came with regard to Israel's major role in the illegal sales of American military equipment to Iran during the bitter Iran-Iraq war of the 1980s, a story that eventually exploded into the headlines as the notorious "Iran-Contra Scandal," although our media did its utmost to hide Israel's central involvement in the affair.

The arms trade with Iran was an extremely lucrative one for Israel, soon expanded to the training of military pilots. The deep ideological antipathy that the Islamic Republic held for the Jewish state required that this business be conducted via third parties, so a smuggling route was established through the small German state of Schleswig-Holstein. However, when an effort was later made to enlist the support of the state's top elected official, he rejected the proposal. The Mossad leaders were fearful that he might interfere in the business, so they successfully fabricated a scandal to unseat him and installed a more pliable German politician in his place. Unfortunately,

the disgraced official raised a fuss and demanded public hearings to clear his name, so Mossad agents lured him to Geneva, and after he rejected a large bribe to keep quiet, killed him, disguising the death so that police ruled it a suicide.

During my original reading, this very lengthy and detailed incident, which ran over 4,000 words, seemed quite doubtful to me. I'd never previously heard of Uwe Barschel, but he was described as a close personal friend of German Chancellor Helmut Kohl, and I found it totally implausible that Mossad had so casually removed a popular and influential European elected official from office, then afterward murdered him. My deep suspicions regarding the rest of Ostrovsky's book were further magnified.

However, in recently revisiting the incident, I discovered that seven months after the book appeared, the *Washington Post* reported that the Barschel case had been reopened, with German, Spanish, and Swiss police investigations finding strong indications of a murder committed exactly along the lines previously suggested by Ostrovsky. Once again, the surprising claims of the Mossad defector had apparently checked out, and I now became much more willing to believe that at least most of his subsequent revelations were probably correct. And there were quite a long list of those.

(As an aside, Ostrovsky noted one of the crucial sources of Mossad's growing internal influence in Germany. The threat of domestic German terrorism led the German government to regularly send large numbers of its security and police officials to Israel for training, and these individuals became ideal targets for intelligence recruitment, continuing to collaborate with their Israeli handlers long after they had returned home and resumed their careers. Thus, although the topmost ranks of those organizations were generally loyal to their country, the mid-ranks gradually became honeycombed with Mossad assets, who could be used for various projects. This raises obvious concerns about America's post-9/11 policy of sending such large numbers of our own police officials to Israel for similar training, as well as the tendency for nearly all newly elected members of Congress to travel there as well.)

I vaguely recalled the early 1980s controversy surrounding UN Secretary-General Kurt Waldheim, who was discovered to have lied about his World War II military service, and left office under a dark cloud, with his name becoming synonymous with long-hidden Nazi war-crimes. Yet according to Ostrovsky, the entire scandal was fabricated by Mossad, which placed incriminating documents obtained

from other files into that of Waldheim. The UN leader had become increasingly critical of Israel's military attacks on South Lebanon, so the falsified evidence was used to launch a smear campaign in the media that destroyed him.

And if Ostrovsky can be credited, for many decades Israel itself had engaged in activities that would have occupied center-stage at the Nuremberg Trials. According to his account, from the late 1960s onward, Mossad had maintained a small laboratory facility at Nes Ziyyona just south of Tel Aviv for the lethal testing of nuclear, chemical, and bacteriological compounds upon hapless Palestinians selected for elimination. This ongoing process of deadly testing allowed Israel to perfect its assassination technologies while also upgrading its powerful arsenal of unconventional weapons that would be available in the event of war. Although during the 1970s, the American media endlessly focused on the terrible depravity of the CIA, I don't ever recall hearing any accusations along these lines.

At one point, Ostrovsky had been surprised to discover that Mossad agents were accompanying Israeli doctors on their medical missions to South Africa, where they treated impoverished Africans at an outpatient clinic in Soweto. The explanation he received was a grim one, namely that private Israeli companies were using the unknowing blacks as human guinea-pigs for the testing of medical compounds in ways that could not legally have been done in Israel itself. I obviously have no means of verifying this claim, but I had sometimes wondered how Israel eventually came to dominate so much of world's generic drug industry, which naturally relies upon the cheapest and most efficient means of testing and production.

Also quite interesting was the story he told of the rise and fall of British press tycoon Robert Maxwell, a Czech immigrant of Jewish background. According to his account, Maxwell had closely collaborated with Mossad throughout his career, and the intelligence service had been crucial in facilitating his rise to power, lending him money early on and deploying their allies in labor unions and the banking industry to weakened his media acquisition targets. Once Maxwell's empire had been created, he repaid his benefactors in ways both legal and illegal, supporting Israel's policies in his newspapers while also providing Mossad with a slush fund, secretly financing their off-the-books European operations with cash from his corporate pension account. Those latter outlays were normally meant to serve as temporary loans, but in 1991 Mossad was slow in returning the funds and he grew financially desperate as his fragile empire tottered. When he hinted at the dangerous secrets he might be forced to reveal

unless he were paid, Mossad killed him instead and disguised it as suicide.

Once again, Ostrovsky's claims cannot be verified, but the dead publisher was given a hero's funeral in Israel, with the serving Prime Minister deeply praising his important services to the Jewish state while three of his predecessors were also in attendance, and Maxwell was buried with full honors in the Mount of Olives. Most recently, his daughter Ghislaine reached the headlines as the closest associate of notorious blackmailer Jeffrey Epstein, and the woman is widely believed to have been a Mossad agent, now possibly hiding in Israel.

But Ostrovsky's most potentially dramatic story occurred in late 1991 and filled one of his last short chapters. In the aftermath of America's great military victory over Iraq in the Gulf War, President George H.W. Bush decided to invest some of his considerable political capital in finally forcing peace in the Middle East between Arabs and Israelis. Right-wing Prime Minister Yitzhak Shamir was bitterly opposed to any of the proposed concessions, so Bush began placing financial pressure upon the Jewish state, blocking loan guarantees despite the efforts of America's powerful Israel Lobby. Within certain circles, he was soon vilified as a diabolical enemy of the Jews.

Ostrovsky explains that when faced with strong opposition by an American president, pro-Israel groups have traditionally cultivated his Vice President as a backdoor means of regaining their influence. For example, when President Kennedy fiercely opposed Israel's nuclear weapons development program in the early 1960s, the Israel Lobby focused their efforts upon Vice President Lyndon Johnson, and this strategy was rewarded when the latter doubled aid to Israel soon after taking office. Similarly, in 1991 they emphasized their friendship with Vice President Dan Quayle, an easy task since his chief of staff and top advisor was William Kristol, a leading Jewish Neocon.

However, an extreme faction in Mossad settled upon a much more direct means of solving Israel's political problems and decided to assassinate President Bush at his international peace conference in Madrid while throwing the blame upon three Palestinian militants. On October 1, 1991, Ostrovsky received a frantic phone call from his leading Mossad collaborator informing him of the plan and desperately seeking his assistance in thwarting it. He initially reacted with total disbelief, finding it difficult to accept that even Mossad hard-liners would consider such a reckless act, but he soon agreed to

do whatever he could to publicize the plot and somehow bring it to the attention of the Bush Administration without being dismissed as a mere “conspiracy theorist.”

Since Ostrovsky was now a prominent author, he was frequently invited to speak on Middle East issues to elite groups, and at his next opportunity, he emphasized the intense hostility of Israeli right-wingers to Bush’s proposals, and strongly suggested that the president’s life was in danger. As it happened, a member of the small audience brought those concerns to the attention of former Congressman Pete McCloskey, an old friend of the president, who soon discussed the situation with Ostrovsky by phone, then flew to Ottawa for a lengthy personal meeting to assess the credibility of the threat. Concluding that the danger was serious and real, McCloskey immediately began using his DC connections to approach members of the Secret Service, finally persuading them to contact Ostrovsky, who explained his inside sources of information. The story was soon leaked to the media, generating extensive coverage by influential columnist Jack Anderson and others, and the resulting publicity caused the assassination plot to be abandoned.

Once again I was quite skeptical after reading this account, so I decided to contact a few people I knew, and they informed me that the Bush Administration had indeed taken Ostrovsky’s warnings about the alleged Mossad assassination plot very seriously at the time, which seemingly confirmed much of the author’s story.

Following his publishing triumph and his success in foiling the alleged plot against the life of President Bush in late 1991, Ostrovsky largely lost touch with his internal Mossad allies, and instead focused on his own private life and new writing career in Canada. Furthermore, the June 1992 Israeli elections brought to power the much more moderate government of Prime Minister Rabin, which seemed to greatly reduce the need for any further anti-Mossad efforts. But government shifts may sometimes have unexpected consequences, especially in the lethal world of intelligence operations, where personal relationships are often sacrificed to expediency.

After the publication of his 1990 book, Ostrovsky had become fearful of being abducted or killed, so as a consequence he had avoided crossing the Atlantic and visiting Europe. But in 1993, his former Mossad allies began urging him to travel to Holland and Belgium to promote the release of new translations of his international bestseller.

They firmly assured him that the political changes in Israel meant that he would now be perfectly safe, and he finally agreed to take the trip despite considerable misgivings. But although he took some reasonable security precautions, an odd incident in Brussels convinced him that he had narrowly escaped a Mossad kidnapping. Growing alarmed, he called his senior Mossad contact at home, but instead of getting any reassurance, he received a strangely cold and unfriendly response, which included a reference to the notorious case of a individual who had once betrayed Mossad and then been killed together with his wife and three children.

Rightly or wrongly, Ostrovsky concluded that the fall of Israel's hard-line government had apparently given the more moderate Mossad faction a chance of gaining control of their organization. Tempted by such power, they now regarded him as a dangerous and expendable loose end, someone who might eventually reveal their own past involvement in anti-Mossad intelligence activities as well as the highly damaging book project.

Believing his former allies now wanted to eliminate him, he quickly began work on his sequel, which would put the full story into the public record, thereby greatly reducing any benefits of shutting his mouth. I also noticed that his new book repeatedly mentioned his secret possession of a comprehensive collection of the names and photos of Mossad's international operatives and whether true or not, that possibility might serve as a life-insurance policy by greatly increasing the risks if Israel took any action against him.

This short description of events closed Ostrovsky's second book, explaining why the volume had been written and contained so much sensitive material that had been excluded from the previous one.

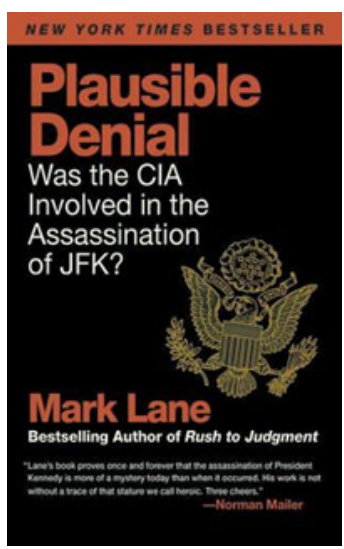
## "Final Judgment" on the JFK Assassination

Ostrovsky's sequel was released late in 1994 by HarperCollins, a leading publisher. But despite its explosive contents, this time Israel and its allies had learned their lesson, and they greeted the work with near-total silence rather than hysterical attacks, so it received relatively little attention and sold only a fraction of the previous number of copies. Among mainstream publications, I could only locate one short and rather negative capsule review in *Foreign Affairs*.

However, another book published at the beginning of that same year on related issues suffered from a far more complete public blackout

that has now still endured for over a quarter-century, and this was not merely because of its obscure origins. Despite the severe handicap of such a near-total media boycott, the work went on to become an underground bestseller, eventually having over 40,000 copies in print, widely read and perhaps discussed in certain circles, but almost never publicly mentioned. *Final Judgment* by the late Michael Collins Piper set forth the explosive hypothesis that Mossad had played a central role in the most famous assassination of the twentieth century, the 1963 killing of President John F. Kennedy.

While Ostrovsky's books drew upon his personal knowledge of Israel's secret intelligence service, Piper was a journalist and researcher who had spent his entire career at Liberty Lobby, a small activist organization based in DC. Being sharply critical of Israeli policies and Zionist influence in America, the group was usually portrayed by the media as part of the far right anti-Semitic populist fringe, and almost entirely ignored by all mainstream outlets. Its weekly tabloid *Spotlight*, which usually focused on controversial topics, had once reached a remarkable circulation of well over 300,000 in the unsettled times of the late 1970s, but then declined substantially in readership during the more placid and optimistic Reagan Era that followed.



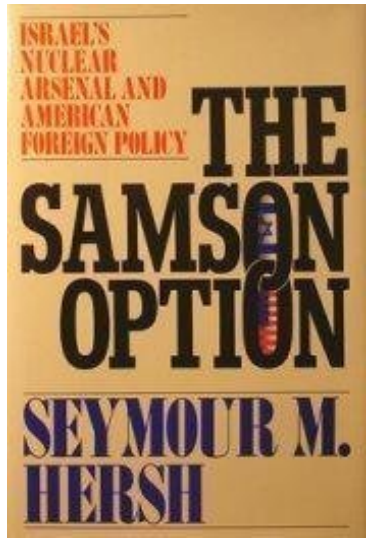
NEW YORK TIMES BESTSELLER
Plausible Denial
Was the CIA Involved in the Assassination of JFK?
Mark Lane
Bestselling Author of Rush to Judgment
"Lane's book proves once and forever that the assassination of President Kennedy is more of a mystery today than when it occurred. His work is not without a trace of that stature we call heroic. Three cheers."
—Norman Mailer

Liberty Lobby had never much delved into JFK assassination issues, but in 1978 it published an article on the subject by Victor Marchetti, a prominent former CIA official, and as a result was soon sued for defamation by E. Howard Hunt of Watergate fame, with the lawsuit threatening its survival. In 1982 this ongoing legal battle attracted the involvement of Mark Lane, an experienced attorney of a leftist

Jewish background who had been the founding father of JFK conspiracy investigations. Lane won the case at trial in 1985 and thereafter remained a close ally of the organization.

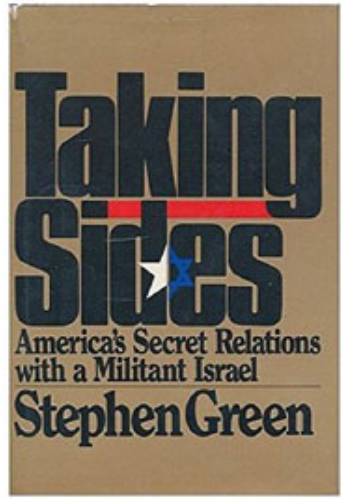
Piper gradually became friendly with Lane and by the early 1990s he himself had grown interested in the JFK assassination. In January 1994, he published his major work, *Final Judgment*, which presented an enormous body of circumstantial evidence backing his theory that Mossad had been heavily involved in the JFK assassination. I summarized and discussed the Piper Hypothesis in my own 2018 article:

> For decades following the 1963 assassination, virtually no suspicions had ever been directed towards Israel, and as a consequence none of the hundreds or thousands of assassination conspiracy books that appeared during the 1960s, 1970s, and 1980s had hinted at any role for the Mossad, though nearly every other possible culprit, ranging from the Vatican to the Illuminati, came under scrutiny. Kennedy had received over 80% of the Jewish vote in his 1960 election, American Jews featured very prominently in his White House, and he was greatly lionized by Jewish media figures, celebrities, and intellectuals ranging from New York City to Hollywood to the Ivy League. Moreover, individuals with a Jewish background such as Mark Lane and Edward Epstein had been among the leading early proponents of an assassination conspiracy, with their controversial theories championed by influential Jewish cultural celebrities such as Mort Sahl and Norman Mailer. Given that the Kennedy Administration was widely perceived as pro-Israel, there seemed no possible motive for any Mossad involvement, and bizarre, totally unsubstantiated accusations of such a monumental nature directed against the Jewish state were hardly likely to gain much traction in an overwhelmingly pro-Israel publishing industry.



However, in the early 1990s highly regarded journalists and researchers began exposing the circumstances surrounding the development of Israel's nuclear weapons arsenal. Seymour Hersh's 1991 book *The Samson Option: Israel's Nuclear Arsenal and American Foreign Policy* described the extreme efforts of the Kennedy Administration to force Israel to allow international inspections of its allegedly non-military nuclear reactor at Dimona, and thereby prevent its use in producing nuclear weapons. *Dangerous Liaisons: The Inside Story of the U.S.-Israeli Covert Relationship* by Andrew and Leslie Cockburn appeared in the same year, and covered similar ground.

Although entirely hidden from public awareness at the time, the early 1960s political conflict between the American and Israeli governments over nuclear weapons development had represented a top foreign policy priority of the Kennedy Administration, which had made nuclear non-proliferation one of its central international initiatives. It is notable that John McCone, Kennedy's choice as CIA Director, had previously served on the Atomic Energy Commission under Eisenhower, being the individual who leaked the fact that Israel was building a nuclear reactor to produce plutonium.

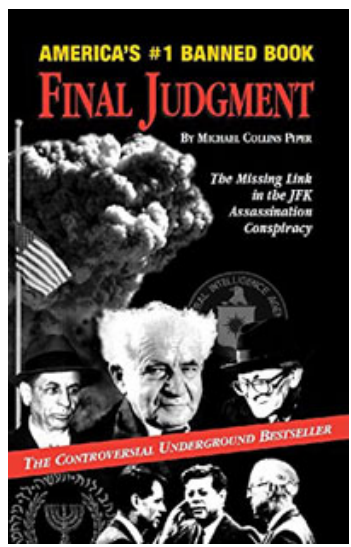


The pressure and financial aid threats secretly applied to Israel by the Kennedy Administration eventually became so severe that they led to the resignation of Israel's founding Prime Minister David Ben-Gurion in June 1963. But all these efforts were almost entirely halted or reversed once Kennedy was replaced by Johnson in November of that same year. Piper notes that Stephen Green's 1984 book *Taking Sides: America's Secret Relations With a Militant Israel* had previously documented that U.S. Middle East Policy completely reversed itself following Kennedy's assassination, but this important finding had attracted little attention at the time.

Skeptics of a plausible institutional basis for a JFK assassination conspiracy have often noted the extreme continuity in both foreign and domestic policies between the Kennedy and Johnson Administrations, arguing that this casts severe doubt on any such possible motive. Although this analysis seems largely correct, America's behavior towards Israel and its nuclear weapons program stands as a very notable exception to this pattern.

An additional major area of concern for Israeli officials may have involved the efforts of the Kennedy Administration to sharply restrict the activities of pro-Israel political lobbies. During his 1960 presidential campaign, Kennedy had met in New York City with a group of wealthy Israel advocates, led by financier Abraham Feinberg, and they had offered enormous financial support in exchange for a controlling influence in Middle Eastern policy. Kennedy managed to fob them off with vague assurances, but he considered the incident so troubling that the next morning

he sought out journalist Charles Bartlett, one of his closest friends, and expressed his outrage that American foreign policy might fall under the control of partisans of a foreign power, promising that if he became president, he would rectify that situation. And indeed, once he had installed his brother Robert as Attorney General, the latter initiated a major legal effort to force pro-Israel groups to register themselves as foreign agents, which would have drastically reduced their power and influence. But after JFK's death, this project was quickly abandoned, and as part of the settlement, the leading pro-Israel lobby merely agreed to reconstitute itself as AIPAC.



AMERICA'S #1 BANNED BOOK
FINAL JUDGMENT
By Michael Collins Piper
The Missing Link in the JFK Assassination Conspiracy
The Controversial Underground Bestseller

*Final Judgment* went through a number of reprintings following its original 1994 appearance, and by the sixth edition released in 2004, had grown to over 650 pages, including numerous long appendices and over 1100 footnotes, the overwhelming majority of these referencing fully mainstream sources. The body of the text was merely serviceable in organization and polish, reflecting the total boycott by all publishers, mainstream or alternative, but I found the contents themselves remarkable and generally quite compelling. Despite the most extreme blackout by all media outlets, the book sold more than 40,000 copies over the years, making it something of an underground bestseller, and surely bringing it to the attention of everyone in the JFK assassination research community, though apparently almost none of them were willing to mention its existence. I suspect these other writers realized that even any mere acknowledgement of the existence of the book, if only to ridicule or dismiss it, might prove

fatal to their media and publishing career. Piper himself died in 2015, aged 54, suffering from the health problems and heavy-drinking often associated with grim poverty, and other journalists may have been reluctant to risk that same dismal fate.

As an example of this strange situation, the bibliography of Talbot's 2005 book contains almost 140 entries, some rather obscure, but has no space for *Final Judgment*, nor does his very comprehensive index include any entry for "Jews" or "Israel." Indeed, at one point he very delicately characterizes Sen. Robert Kennedy's entirely Jewish senior staff by stating "There was not a Catholic among them." His 2015 sequel is equally circumspect, and although the index does contain numerous entries pertaining to Jews, all these references are in regards to World War II and the Nazis, including his discussion of the alleged Nazi ties of Allen Dulles, his principal *bête noire*. Stone's book, while fearlessly convicting President Lyndon Johnson of the JFK assassination, also strangely excludes "Jews" and "Israel" from the long index and *Final Judgment* from the bibliography, and Douglass's book follows this same pattern.

Furthermore, the extreme concerns that the Piper Hypothesis seems to have provoked among JFK assassination researchers may explain a strange anomaly. Although Mark Lane was himself of Jewish origins and left-wing roots, after his victory for Liberty Lobby in the Hunt libel trial, he spent many years associated with that organization in a legal capacity, and apparently became quite friendly with Piper, one of its leading writers. According to Piper, Lane told him that *Final Judgment* made "a solid case" for a major Mossad role in the assassination, and he viewed the theory as fully complementary to his own focus on CIA involvement. I suspect that concerns about these associations may explain why Lane was almost completely airbrushed out of the Douglass and 2007 Talbot books, and discussed in the second Talbot book only when his work was absolutely essential to Talbot's own analysis. By contrast, *New York Times* staff writers are hardly likely to be as versed in the lesser-known aspects of the JFK assassination research community, and being ignorant of this hidden controversy, they gave Lane the long and glowing obituary that his career fully warranted.

When weighing the possible suspects for a given crime, considering their past pattern of behavior is often a helpful

approach. As discussed above, I can think of no historical example in which organized crime initiated a serious assassination attempt against any American political figure even moderately prominent on the national stage. And despite a few suspicions here and there, the same applies to the CIA.

By contrast, the Israeli Mossad and the Zionist groups that preceded the establishment of the Jewish state seem to have had a very long track record of assassinations, including those of high-ranking political figures who might normally be regarded as inviolate. Lord Moyne, the British Minister of State for the Middle East, was assassinated in 1944 and Count Folke Bernadotte, the UN Peace Negotiator sent to help resolve the first Arab-Israel war, suffered the same fate in September 1948. Not even an American president was entirely free of such risks, and Piper notes that the memoirs of Harry Truman's daughter Margaret reveal that Zionist militants had tried to assassinate her father using a letter laced with toxic chemicals in 1947 when they believed he was dragging his heels in supporting Israel, although that failed attempt was never made public. The Zionist faction responsible for all of these incidents was led by Yitzhak Shamir, who later became a leader of Mossad and director of its assassination program during the 1960s, before eventually becoming Prime Minister of Israel in 1986.

There are other notable elements that tend to support the Piper Hypothesis. Once we accept the existence of a JFK assassination conspiracy, the one individual who is virtually certain to have been a participant was Jack Ruby, and his organized crime ties were almost entirely to the huge but rarely-mentioned Jewish wing of that enterprise, presided over by Meyer Lansky, an extremely fervent supporter of Israel. Ruby himself had particularly strong connections with Lansky lieutenant Mickey Cohen, who dominated the Los Angeles underworld and had been personally involved in gun-running to Israel prior to the 1948 war. Indeed, according to Dallas rabbi Hillel Silverman, Ruby had privately explained his killing of Oswald by saying "I did it for the Jewish people."

An intriguing aspect to Oliver Stone's landmark *JFK* film should also be mentioned. Arnon Milchan, the wealthy Hollywood producer who backed the project, was not only an Israeli citizen, but had also reportedly played a central role in the enormous espionage project to divert American technology and materials to Israel's nuclear weapons project, the exact undertaking that the

Kennedy Administration had made such efforts to block. Milchan has even sometimes been described as "the Israeli James Bond." And although the film ran a full three hours in length, *JFK* scrupulously avoided presenting any of the details that Piper later regarded as initial clues to an Israeli dimension, instead seeming to finger America's fanatic home-grown anti-Communist movement and the Cold War leadership of the military-industrial complex as the guilty parties.

Summarizing over 300,000 words of Piper's history and analysis in just a few paragraphs is obviously an impossible undertaking, but the above discussion provides a reasonable taste of the enormous mass of circumstantial evidence mustered in favor of the Piper Hypothesis.

In many respects, JFK Assassination Studies has become its own academic discipline, and my credentials are quite limited. I have read perhaps a dozen books in the subject, and have also tried to approach the issues with the clean slate and fresh eyes of an outsider, but any serious expert would surely have digested scores or even hundreds of the volumes in the field. While the overall analysis of *Final Judgment* struck me as quite persuasive, a good fraction of the names and references were unfamiliar, and I simply do not have the background to assess their credibility, nor whether the description of the material presented is accurate.

Under normal circumstances, I would turn to the reviews or critiques produced by other authors, and comparing them against Piper's claims, then decide which argument seemed the stronger. But although *Final Judgment* was published a quarter-century ago, the near-absolute blanket of silence surrounding the Piper Hypothesis, especially from the more influential and credible researchers, renders this impossible.

However, Piper's inability to secure any regular publisher and the widespread efforts to smother his theory out of existence, have had an ironic consequence. Since the book went out of print years ago, I had a relatively easy time securing the rights to include it in my collection of controversial HTML Books, and I have now done so, thereby allowing everyone on the Internet to conveniently read the entire text and decide for themselves, while easily checking the multitude of references or searching for particular words or phrases.

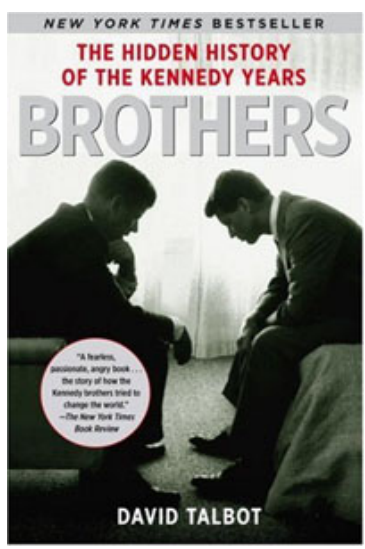
- Final Judgment
  *The Missing Link in the JFK Assassination Conspiracy*
  Michael Collins Piper • 2005 • 310,000 Words

This edition actually incorporates several much shorter works, originally published separately. One of these, consisting of an extended Q&A, describes the genesis of the idea and answers numerous questions surrounding it, and for some readers might represent a better starting point.

- Default Judgment
  *Questions, Answers & Reflections About the Crime of the Century*
  Michael Collins Piper • 2005 • 48,000 Words

There are also numerous extended Piper interviews or presentations easily available on YouTube, and when I watched two or three of them a couple of years ago, I thought he effectively summarized many of his main arguments, but I cannot remember which ones they were.

Some additional evidence tends to support Piper's arguments for likely Mossad involvement in the death of our president.



David Talbot's influential 2007 book *Brothers* revealed that Robert F. Kennedy had been convinced almost from the first that his brother had been struck down in a conspiracy, but he held his tongue, telling

his circle of friends that he stood little chance of tracking down and punishing the guilty parties until he himself reached the White House. By June 1968, he seemed on the threshold of achieving that goal, but was felled by an assassin's bullet just moments after winning the crucial California presidential primary. The logical assumption is that his death was engineered by the same elements as that of his elder brother, who were now acting to protect themselves from the consequences of their earlier crime.

A young Palestinian named Sirhan Sirhan had fired a pistol at the scene and was quickly arrested and convicted for the murder. But Talbot emphasizes that the coroner's report revealed that the fatal bullet came from a completely different direction, while the acoustical record proves that far more shots were fired than the capacity of the alleged killer's gun. Such hard evidence seems to demonstrate a conspiracy.

Sirhan himself seemed dazed and confused, later claiming to have no memory of events, and Talbot mentions that various assassination researchers have long argued that he was merely a convenient patsy in the plot, perhaps acting under some form of hypnosis or conditioning. Nearly all these writers are usually reluctant to note that the selection of a Palestinian as scapegoat in the killing seems to point in a certain obvious direction, but Bergman's recent book also includes a major new revelation. At exactly the same moment that Sirhan was being wrestled to the floor of the Ambassador Hotel ballroom in Los Angeles, another young Palestinian was undergoing intensive rounds of hypnotic conditioning at the hands of Mossad in Israel, being programmed to assassinate PLO leader Yasir Arafat; and although that effort ultimately failed, such a coincidence seems to stretch the bounds of plausibility.

Three decades later, JFK's heir and namesake had developed a growing public profile as publisher of his popular political magazine *George*, which attracted considerable international controversy when he published a long article claiming that the assassination of Israeli Prime Minister Rabin had been orchestrated by hard-liners within Israel's own security services. There were also strong indications that JFK Jr. might soon enter politics, perhaps running for the US Senate as a stepping-stone to the White House.

Instead, he died in an unusual 1999 light plane crash, and a later edition of Piper's book outlined some of the suspicious circumstances,

which the author believed suggested an Israeli hand. For years Piper had made efforts to bring his explosive book to the attention of JFK's son, and he thought that he might have finally succeeded. Israeli-Canadian author Barry Chamish also believed that it was JFK Jr.'s discovery of the Piper Hypothesis that had led the younger Kennedy to promote the Rabin assassination conspiracy theory in his magazine.

Last year, French researcher Laurent Guyénot published an exhaustive analysis of JFK Jr.'s death, arguing that he was probably killed by Israel. My own reading of the material he presents is rather different, and although there are a number of somewhat suspicious items, I think that the evidence of foul play—let alone Mossad involvement—is rather thin, leading me to conclude that the plane crash was probably just the tragic accident portrayed by the media. But the aftermath of the death did highlight an important ideological divide.

For six decades, members of the Kennedy family have been wildly popular among ordinary American Jews, probably attracting greater political enthusiasm than almost any other public figures. But this undeniable reality has masked an entirely different perspective found within a particular section of that same community.

John Podhoretz, a leading scion of the militantly pro-Israel Neocons, was opinion editor of *The New York Post* at the time of the fatal plane crash, and he immediately published an astonishing column entitled "A Conversation in Hell" in which he positively reveled at the death of the young Kennedy. He portrayed patriarch Joseph Kennedy as an unspeakable anti-Semite who had sold his soul to the Devil for his own worldly success and that of his family, then suggested that all the subsequent assassinations and other early deaths of Kennedys merely constituted the fine print of that Satanic bargain. So brutally harsh a piece surely indicates that those bitter sentiments were hardly uncommon within Podhoretz's small ultra-Zionist social circle, which probably overlapped with similar right-wing elements in Israel. So this reaction demonstrates that the exact same political figures who were most deeply beloved by the overwhelming majority of American Jews may have also been regarded as mortal enemies by an influential segment of the Jewish state and its corps of Mossad assassins.

When I published my original 2018 article on the JFK assassination, I naturally noted the widespread use of assassination by Zionist groups, a pattern that had long predated the creation of the Jewish state, and I cited some of the supportive evidence contained in the two Ostrovsky books. But at the time, I still had considerable doubts about Ostrovsky's credibility, especially regarding the shocking claims in his

second book, and I had not yet read Bergman's volume, which had just been published a few months earlier. So although there seemed considerable evidence for the Piper Hypothesis, I regarded it as far from conclusive.

However, I have now digested Bergman's book, which documents the enormous volume of international Mossad assassinations, and I have also concluded that Ostrovsky's claims were far more solid than I had previously assumed. As a result my opinion has substantially shifted. Instead of merely being a solid possibility, I believe there is actually a strong likelihood that Mossad together with its American collaborators played a central role in the Kennedy assassinations of the 1960s, leading me to fully affirm the Piper Hypothesis. Guyénot has relied upon many of the same sources and has come to roughly similar conclusions.

## The Strange Death of James Forrestal, and Other Fatalities

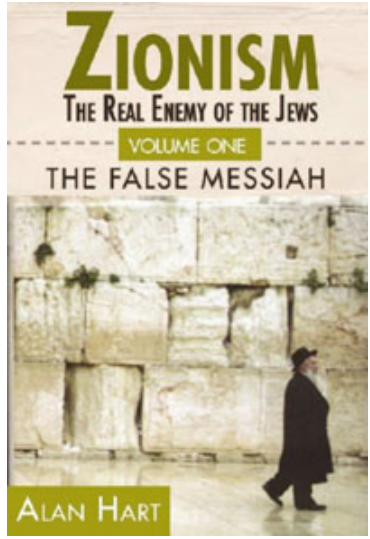
Once we recognize that Israel's Mossad was probably responsible for the assassination of President John F. Kennedy, our understanding of post-war American history may require substantial reevaluation.

The JFK assassination was possibly the most famous event of the second half of the twentieth century, and it inspired a vast outpouring of media coverage and journalistic investigation that seemingly explored every nook and crany of the story. Yet for the first three decades after the killing in Dallas, virtually no whisper of suspicion was ever directed at Israel, and during the quarter-century since Piper published his ground-breaking 1994 book, scarcely any of his analysis has leaked into the English-language media. If a story of such enormity has remained so well hidden for so long, perhaps it was neither the first nor the last.

If the Kennedy brothers did indeed perish due to a conflict over our Middle Eastern policy, they were certainly not the first prominent Western leaders to suffer that fate, especially when we consider the bitter political battles a generation earlier over the establishment of Israel. All our standard history books describe the mid-1940s Zionist assassinations of Lord Moyne of Britain and U.N. Peace Negotiator Count Folke Bernodotte, though they rarely mention the failed attempts on the lives of President Harry S. Truman and Britain Foreign Secretary Ernest Bevin around the same time.

But another leading American public figure also died during that period under rather strange circumstances, and although his demise is always mentioned, the crucial political context is excluded, as I discussed at length in a 2018 article:

> Sometimes our standard history textbooks provide two seemingly unrelated stories, which become far more important only once we discover that they are actually parts of a single connected whole. The strange death of James Forrestal certainly falls into this category.
>
> During the 1930s Forrestal had reached the pinacle of Wall Street, serving as CEO of Dillon, Read, one of the most prestigious investment banks. With World War II looming, Roosevelt drew him into government service in 1940, partly because his strong Republican credentials helped emphasize the bipartisan nature of the war effort, and he soon became Undersecretary of the Navy. Upon the death of his elderly superior in 1944, Forrestal was elevated to the Cabinet as Navy Secretary, and after the contentious battle over the reorganization of our military departments, he became America's first Secretary of Defense in 1947, holding authority over the Army, Navy, Air Force, and Marines. Along with Secretary of State Gen. George Marshall, Forrestal probably ranked as the most influential member of Truman's Cabinet. However, just a few months after Truman's 1948 reelection, we are told that Forrestal became paranoid and depressed, resigned his powerful position, and weeks later committed suicide by jumping from an 18th story window at Bethesda Naval Hospital. Knowing almost nothing about Forrestal or his background, I always nodded my head over this odd historical event.
>
> Meanwhile, an entirely different page or chapter of my history textbooks usually carried the dramatic story of the bitter political conflict that wracked the Truman Administration over the recognition of the State of Israel, which had taken place the previous year. I read that George Marshall argued such a step would be totally disastrous for American interests by potentially alienating many hundreds of millions of Arabs and Muslims, who held the enormous oil wealth of the Middle East, and felt so strongly about the matter that he threatened to resign. However, Truman, heavily influenced by the personal lobbying of his old Jewish haberdashery business partner Eddie Jacobson, ultimately decided upon recognition, and Marshall stayed in the government.



However, almost a decade ago, I somehow stumbled across an interesting book by Alan Hart, a journalist and author who had served as a longtime BBC Middle East Correspondent, in which I discovered that these two different stories were part of a seamless whole. By his account, although Marshall had indeed strongly opposed recognition of Israel, it had actually been Forrestal who spearheaded that effort in Truman's Cabinet and was most identified with that position, resulting in numerous harsh attacks in the media and his later departure from the Truman Cabinet. Hart also raised very considerable doubts about whether Forrestal's subsequent death had actually been suicide, citing an obscure website for a detailed analysis of that last issue.

It is a commonplace that the Internet has democratized the distribution of information, allowing those who create knowledge to connect with those who consume it without the need for a gate-keeping intermediary. I have encountered few better examples of the unleashed potential of this new system than "Who Killed Forrestal?", an exhaustive analysis by a certain David Martin, who describes himself as an economist and political blogger. Running many tens of thousands of words, his series of articles on the fate of America's first Secretary of Defense provides an exhaustive discussion of all the source materials, including the small handful of published books describing Forrestal's life and strange death, supplemented by contemporaneous newspaper articles and numerous relevant government documents obtained by personal FOIA requests. The verdict of murder followed by a massive governmental cover-up

seems solidly established.

As mentioned, Forrestal's role as the Truman Administration's principal opponent of Israel's creation had made him the subject of an almost unprecedented campaign of personal media vilification in both print and radio, spearheaded by the country's two most powerful columnists of the right and the left, Walter Winchell and Drew Pearson, only the former being Jewish, but both heavily connected with the ADL and extremely pro-Zionist, with their attacks and accusations even continuing after his resignation and death.

Once we move past the wild exaggerations of Forrestal's alleged psychological problems promoted by these very hostile media pundits and their many allies, much of Forrestal's supposed paranoia apparently consisted of his belief that he was being followed around Washington, D.C., his phones may have been tapped, and his life might be in danger at the hands of Zionist agents. And perhaps such concerns were not so entirely unreasonable given certain contemporaneous events.

Indeed, State Department official Robert Lovett, a relatively minor and low-profile opponent of Zionist interests, reported receiving numerous threatening phone calls late at night around the same time, which greatly concerned him. Martin also cites subsequent books by Zionist partisans who boasted of the effective use their side had made of blackmail, apparently obtained by wire-tapping, to ensure sufficient political support for Israel's creation.

Meanwhile, behind the scenes, powerful financial forces may have been gathering to ensure that President Truman ignored the unified recommendations of all his diplomatic and national security advisors. Years later, both Gore Vidal and Alexander Cockburn would separately report that it eventually became common knowledge in DC political circles that during the desperate days of Truman's underdog 1948 reelection campaign, he had secretly accepted a cash payment of $2 million from wealthy Zionists in exchange for recognizing Israel, a sum perhaps comparable to $20 million or more in present-day dollars.

Republican Thomas Dewey had been heavily favored to win the 1948 presidential election, and after Truman's surprising upset, Forrestal's political position was certainly not helped when

Pearson claimed in a newspaper column that Forrestal had secretly met with Dewey during the campaign, making arrangements to be kept on in a Dewey Administration.

Suffering political defeat regarding Middle East policy and facing ceaseless media attacks, Forrestal resigned his Cabinet post under pressure. Almost immediately afterwards, he was checked into the Bethesda Naval Hospital for observation, supposedly suffering from severe fatigue and exhaustion, and he remained there for seven weeks, with his access to visitors sharply restricted. He was finally scheduled to be released on May 22, 1949, but just hours before his brother Henry came to pick him up, his body was found below the window of his 18th floor room, with a knotted cord wound tightly around his neck. Based upon an official press release, the newspapers all reported his unfortunate suicide, suggesting that he had first tried to hang himself, but failing that approach, had leapt out his window instead. A half page of copied Greek verse was found in his room, and in the heydey of Freudian psychoanalyical thinking, this was regarded as the subconscious trigger for his sudden death impulse, being treated as almost the equivalent of an actual suicide note. My own history textbooks simplified this complex story to merely say "suicide," which is what I read and never questioned.

Martin raises numerous very serious doubts with this official verdict. Among other things, published interviews with Forrestal's surviving brother and friends reveal that none of them believed Forrestal had taken his own life, and that they had all been prevented from seeing him until near the very end of his entire period of confinement. Indeed, the brother recounted that just the day before, Forrestal had been in fine spirits, saying that upon his release, he planned to use some of his very considerable personal wealth to buy a newspaper and begin revealing to the American people many of the suppressed facts concerning America's entry into World War II, of which he had direct knowledge, supplemented by the extremely extensive personal diary that he had kept for many years. Upon Forrestal's confinement, that diary, running thousands of pages, had been seized by the government, and after his death was apparently published only in heavily edited and expurgated form, though it nonetheless still became a historical sensation.

The government documents unearthed by Martin raise additional doubts about the story presented in all the standard history books. Forrestal's medical files seem to lack any official autopsy

report, there is visible evidence of broken glass in his room, suggesting a violent struggle, and most remarkably, the page of copied Greek verse—always cited as the main indication of Forrestal's final suicidal intent—was actually not written in Forrestal's own hand.

Aside from newspaper accounts and government documents, much of Martin's analysis, including the extensive personal interviews of Forrestal's friends and relatives, is based upon a short book entitled *The Death of James Forrestal*, published in 1966 by one Cornell Simpson, almost certainly a pseudonym. Simpson states that his investigative research had been conducted just a few years after Forrestal's death and although his book was originally scheduled for release his publisher grew concerned over the extremely controversial nature of the material included and cancelled the project. According to Simpson, years later he decided to take his unchanged manuscript off the shelf and have it published by Western Islands press, which turns out to have been an imprint of the John Birch Society, the notoriously conspiratorial rightwing organization then near the height of its national influence. For these reasons, certain aspects of the book are of considerable interest even beyond the contents directly relating to Forrestal.

The first part of the book consists of a detailed presentation of the actual evidence regarding Forrestal's highly suspicious death, including the numerous interviews with his friends and relatives, while the second portion focuses on the nefarious plots of the world-wide Communist movement, a Birch Society staple. Allegedly, Forrestal's staunch anti-Communism had been what targeted him for destruction by Communist agents, and there is virtually no reference to any controversy regarding his enormous public battle over Israel's establishment, although that was certainly the primary factor behind his political downfall. Martin notes these strange inconsistencies, and even wonders whether certain aspects of the book and its release may have been intended to deflect attention from this Zionist dimension towards some nefarious Communist plot.

Consider, for example, David Niles, whose name has lapsed into total obscurity, but who had been one of the very few senior FDR aides retained by his successor, and according to observers, Niles eventually became one of the most powerful figures behind the scenes of the Truman Administration. Various accounts suggest he played a leading role in Forrestal's removal, and Simpson's

book supports this, suggesting that he was Communist agent of some sort. However, although the Venona Papers reveal that Niles had sometimes cooperated with Soviet agents in their espionage activities, he apparently did so either for money or for some other considerations, and was certainly not part of their own intelligence network. Instead, both Martin and Hart provide an enormous amount of evidence that Niles's loyalty was overwhelmingly to Zionism, and indeed by 1950 his espionage activities on behalf of Israel became so extremely blatant that Gen. Omar Bradley, Chairman of the Joint Chiefs of Staff, threatened to immediately resign unless Niles was fired, forcing Truman's hand.

Forrestal was a wealthy and pugnacious Irish Catholic, and I think there is very considerable evidence that his death was the result of factors quite similar to those that probably claimed the life of an even more prominent Irish Catholic in Dallas 14 years later.

There are some other possible fatalities that follow this pattern, though the evidence in those cases is far less strong. Piper's 1994 opus is focused primarily on the JFK assassination, but over half his 650 pages are given over to long series of appendices dealing with somewhat related topics. One of these discusses the strange deaths of a couple of former high-ranking CIA officials, suggesting they might have involved foul play.

Former CIA Director William Colby had apparently long been regarded as highly skeptical of the nature of America's relationship with Israel, and therefore was characterized by pro-Israel members of the media as a notorious "Arabist." Indeed, while serving as director in 1974, he had finally ended the career of longtime CIA counter-intelligence chief James Angleton, whose extreme affinity with Israel and its Mossad had sometimes raised serious doubts about his true loyalties. Piper says that by 1996 Colby had grown sufficiently concerned about Israel's infiltration and manipulation of the US government and its intelligence community that he arranged a meeting with high-level Arab officials in DC, suggesting that they all work together to counter this disturbing situation. A few weeks later, Colby disappeared and his drowned body was eventually found, with the official verdict being that he supposedly perished near his home in a canoeing accident, although his former Arab interlocutors alleged foul play.

Piper goes on to also describe the earlier death of John Paisley, the former longtime deputy director of the CIA's Office of Strategic Research, and also a strong critic of the influence of Israel and its close Neocon allies in American national security policy. In late 1978, Paisley's body was found floating in the Chesapeake Bay with a bullet in the head, and although the death was officially ruled a suicide, Piper claims that few believed the story. According to him, Richard Clement, who had headed the Interagency Committee on Counterterrorism during the Reagan Administration, explained in 1996:

> The Israelis had no compunction about "terminating" key American intelligence officials who threatened to blow the whistle on them. Those of us familiar with the case of Paisley know that he was killed by Mossad. But no one, not even in Congress, wants to stand up and say so publicly.

Piper notes the bitter political battles that other Washington national security experts, such as former CIA Deputy Director Adm. Bobby Ray Inman, had experienced over the years with elements of the Israel Lobby in Congress and the media. After Inman was nominated by President Clinton to lead the Defense Department, a firestorm of criticism by pro-Israel partisans forced his withdrawal.

I have made no effort to investigate the material cited by Piper in his short discussion. These examples were previously unknown to me, and all of the evidence he provides seems purely circumstantial, hardly making a case that rises above mere suspicion. But I do regard the author as a reasonably solid investigative journalist and researcher, whose views should be taken seriously. Therefore, those so interested can read his 5,000 word Appendix Six and decide for themselves.

## The 9/11 Attacks – What Happened?

Although somewhat related, political assassinations and terrorist attacks are distinct topics, and Bergman's comprehensive volume explicitly focuses on the former, so we cannot fault him for providing only slight coverage of the latter. But the historical pattern of Israeli activity, especially with regard to false-flag attacks, is really quite remarkable, as I noted in a 2018 article:

> One of history's largest terrorist attacks prior to 9/11 was the 1946 bombing of the King David Hotel in Jerusalem by Zionist militants dressed as Arabs, which killed 91 people and largely

> destroyed the structure. In the famous Lavon Affair of 1954, Israeli agents launched a wave of terrorist attacks against Western targets in Egypt, intending to have those blamed on anti-Western Arab groups. There are strong claims that in 1950 Israeli Mossad agents began a series of false-flag terrorist bombings against Jewish targets in Baghdad, successfully using those violent methods to help persuade Iraq's thousand-year-old Jewish community to emigrate to the Jewish state. In 1967, Israel launched a deliberate air and sea attack against the *U.S.S. Liberty*, intending to leave no survivors, killing or wounding over 200 American servicemen before word of the attack reached our Sixth Fleet and the Israelis withdrew.
>
> The enormous extent of pro-Israel influence in world political and media circles meant that none of these brutal attacks ever drew serious retaliation, and in nearly all cases, they were quickly thrown down the memory hole, so that today probably no more than one in a hundred Americans is even aware of them. Furthermore, most of these incidents came to light due to chance circumstances, so we may easily suspect that many other attacks of a similar nature have never become part of the historical record.

Of these famous incidents, Bergman only includes mention of the King David Hotel bombing. But much later in his narrative, he describes the huge wave of false-flag terrorist attacks unleashed in 1981 by Israeli Defense Minister Ariel Sharon, who recruited a former high-ranking Mossad official to manage the project.

Under Israeli direction, large car bombs began exploding in the Palestinian neighborhoods of Beirut and other Lebanese cities, killing or injuring enormous numbers of civilians. A single attack in October inflicted nearly 400 casualties, and by December, there were eighteen bombings per month, with their effectiveness greatly enhanced by the use of innovative new Israeli drone technology. Official responsibility for all the attacks was claimed by a previously unknown Lebanese organization, but the intent was to provoke the PLO into military retaliation against Israel, thereby justifying Sharon's planned invasion of the neighboring country.

Since the PLO stubbornly refused to take the bait, plans were put into motion for the huge bombing of an entire Beirut sports stadium using tons of explosives during a January 1st political ceremony, with the death and destruction expected to be "of unprecedented proportions, even in terms of Lebanon." But Sharon's political enemies learned of

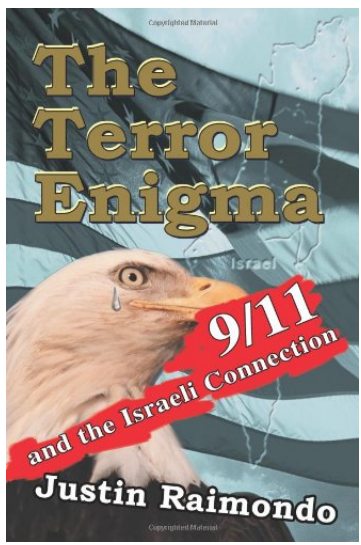
the plot and emphasized that many foreign diplomats including the Soviet ambassador were expected to be present and probably would be killed, so after a bitter debate, Prime Minister Begin ordered the attack aborted. A future Mossad chief mentions the major headaches they then faced in removing the large quantity of explosives that they had already planted within the structure.

I think that this thoroughly documented history of major Israeli false-flag terrorist attacks, including those against American and other Western targets, should be carefully kept in mind when we consider the 9/11 attacks, whose aftermath has massively transformed our society and cost us so many trillions of dollars. I analyzed the strange circumstances of the attacks and their likely nature at considerable length in my 2018 article:

> Oddly enough, for many years after 9/11, I paid very little attention to the details of the attacks themselves. I was entirely preoccupied with building my content-archiving software system, and with the little time I could spare for public policy matters, I was totally focused to the ongoing Iraq War disaster, as well as my terrible fears that Bush might at any moment suddenly extend the conflict to Iran. Despite Neocon lies shamelessly echoed by our corrupt media, neither Iraq nor Iran had had anything whatsoever to do with the 9/11 attacks, so those events gradually faded in my consciousness, and I suspect the same was true for most other Americans. Al Qaeda had largely disappeared and Bin Laden was supposedly hiding in a cave somewhere. Despite endless Homeland Security "threat alerts," there had been no further Islamic terrorism on American soil, and relatively little anywhere else outside of the Iraq charnel house. So the precise details of the 9/11 plots had become almost irrelevant to me.
>
> Others I knew seemed to feel the same way. Virtually all the exchanges I had with my old friend Bill Odom, the three-star general who had run the NSA for Ronald Reagan, had concerned the Iraq War and risk it might spread to Iran, as well as the bitter anger he felt toward Bush's perversion of his beloved NSA into an extra-constitutional tool of domestic espionage. When the *New York Times* broke the story of the massive extent of domestic NSA spying, Gen. Odom declared that President Bush should be impeached and NSA Director Michael Hayden court-martialed. But in all the years prior to his untimely passing in 2008, I don't recall the 9/11 attacks themselves even once coming up as a topic

in our discussions.

Admittedly, I'd occasionally heard of some considerable oddities regarding the 9/11 attacks here and there, and these certainly raised some suspicions. Most days I would glance at the *Antiwar.com* front page, and it seemed that some Israeli Mossad agents had been caught while filming the plane attacks in NYC, while a much larger Mossad "art student" spy operation around the country had also been broken up around the same time. Apparently, *FoxNews* had even broadcast a multi-part series on the latter topic before that expose was scuttled and "disappeared" under ADL pressure.



Although I wasn't entirely sure about the credibility of those claims, it did seem plausible that Mossad had known of the attacks in advance and allowed them to proceed, recognizing the huge benefits that Israel would derive from the anti-Arab backlash. I think I was vaguely aware that *Antiwar.com* editorial director Justin Raimondo had published *The Terror Enigma*, a short book about some of those strange facts, bearing the provocative subtitle "9/11 and the Israeli Connection," but I never considered reading it. In 2007, *Counterpunch* itself published a fascinating follow-up story about the arrest of that group of Israeli Mossad agents in NYC, who were caught filming and apparently celebrating the plane attacks on that fateful day, and the Mossad activity seemed to be far larger than I had previously realized. But all these details remained a little fuzzy in my mind next to my overriding

concerns about wars in Iraq and Iran.

However, by the end of 2008 my focus had begun to change. Bush was leaving office without having started an Iranian war, and America had successfully dodged the bullet of an even more dangerous John McCain administration. I assumed that Barack Obama would be a terrible president and he proved worse than my expectations, but I still breathed a huge sigh of relief every day that he was in the White House.

Moreover, around that same time I'd stumbled across an astonishing detail of the 9/11 attacks that demonstrated the remarkable depths of my own ignorance. In a *Counterpunch* article, I'd discovered that immediately following the attacks, the supposed terrorist mastermind Osama bin Laden had publicly denied any involvement, even declaring that no good Muslim would have committed such deeds.

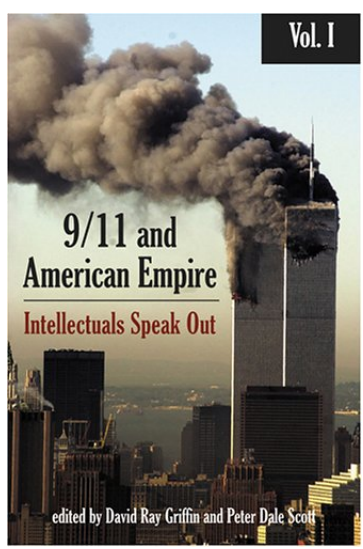
Once I checked around a little and fully confirmed that fact, I was flabbergasted. 9/11 was not only the most successful terrorist attack in the history of the world, but may have been greater in its physical magnitude than all past terrorist operations combined. The entire purpose of terrorism is to allow a small organization to show the world that it can inflict serious losses upon a powerful state, and I had never previously heard of any terrorist leader denying his role in a successful operation, let alone the greatest in history. Something seemed extremely wrong in the media-generated narrative that I had previously accepted. I began to wonder if I had been as deluded as the tens of millions of Americans in 2003 and 2004 who naively believed that Saddam had been the mastermind behind the September 11th attacks. We live in a world of illusions generated by our media, and I suddenly felt that I had noticed a tear in the paper-mache mountains displayed in the background of a Hollywood sound-stage. If Osama was probably not the author of 9/11, what other huge falsehoods had I blindly accepted?

A couple of years later, I came across a very interesting column by Eric Margolis, a prominent Canadian foreign policy journalist purged from the broadcast media for his strong opposition to the Iraq War. He had long published a weekly column in the *Toronto Sun* and when that tenure ended, he used his closing appearance to run a double-length piece expressing his very strong doubts

about the official 9/11 story, even noting that the former director of Pakistani Intelligence insisted that Israel had been behind the attacks.

I eventually discovered that in 2003 former German Cabinet Minister Andreas von Bülow had published a best-selling book strongly suggesting that the CIA rather than Bin Laden was behind the attacks, while in 2007 former Italian President Francesco Cossiga had similarly argued that the CIA and the Israeli Mossad had been responsible, claiming that fact was well known among Western intelligence agencies.

Over the years, all these discordant claims had gradually raised my suspicions about the official 9/11 story to rather strong levels, but it was only very recently that I finally found the time to begin to seriously investigate the subject and read eight or ten of the main 9/11 Truther books, mostly those by Prof. David Ray Griffin, the widely acknowledged leader in that field. And his books, together with the writings of his numerous colleagues and allies, revealed all sorts of very telling details, most of which had previously been unknown to me. I was also greatly impressed by the sheer number of seemingly reputable individuals of no apparent ideological bent who had become adherents of the 9/11 Truth movement over the years.



When utterly astonishing claims of an extremely controversial nature are made over a period of many years by numerous seemingly reputable academics and other experts, and they are

entirely ignored or suppressed but never effectively rebutted, reasonable conclusions seem to point in an obvious direction. Based on my very recent readings in this topic, the total number of huge flaws in the official 9/11 story has now grown extremely long, probably numbering in the many dozens. Most of these individual items seem reasonably likely and if we decide that even just two or three of them are correct, we must totally reject the official narrative that so many of us have believed for so long.

Now I am merely just an amateur in the complex intelligence craft of extracting nuggets of truth from a mountain of manufactured falsehood. Although the arguments of the 9/11 Truth Movement seem quite persuasive to me, I would obviously have felt much more comfortable if they were seconded by an experienced professional, such as a top CIA analyst. A few years ago, I was shocked to discover that was indeed the case.

William Christison had spent 29 years at the CIA, rising to become one of its senior figures as Director of its Office of Regional and Political Analysis, with 200 research analysts serving under him. In August 2006, he published a remarkable 2,700 word article explaining why he no longer believed the official 9/11 story and felt sure that the 9/11 Commission Report constituted a cover-up, with the truth being quite different. The following year, he provided a forceful endorsement to one of Griffin's books, writing that "[There's] a strong body of evidence showing the official U.S. Government story of what happened on September 11, 2001 to be almost certainly a monstrous series of lies." And Christison's extreme 9/11 skepticism was seconded by that of many other highly regarded former US intelligence professionals.

We might expect that if a former CIA intelligence officer of Christison's rank were to denounce the official 9/11 report as a fraud and a cover-up, such a story would constitute front-page news. But it was never reported anywhere in our mainstream media, and I only stumbled upon it a decade later.

Even our supposed "alternative" media outlets were nearly as silent. Throughout the 2000s, Christison and his wife Kathleen, also a former CIA analyst, had been regular contributors to *Counterpunch*, publishing many dozens of articles there and certainly being its most highly credentialed writers on intelligence and national security matters. But editor Alexander Cockburn refused to publish any of their 9/11 skepticism, so it

never came to my attention at the time. Indeed, when I mentioned Christison's views to current *Counterpunch* editor Jeffrey St. Clair a couple of years ago, he was stunned to discover that the friend he had regarded so very highly had actually become a "9/11 Truther." When media organs serve as ideological gatekeepers, a condition of widespread ignorance becomes unavoidable.

With so many gaping holes in the official story of the events of seventeen years ago, each of us is free to choose to focus on those we personally consider most persuasive, and I have several of my own. Danish Chemistry professor Niels Harrit was one of the scientists who analyzed the debris of the destroyed buildings and detected the residual presence of nano-thermite, a military-grade explosive compound, and I found him quite credible during his hour-long interview on *Red Ice Radio*. The notion that an undamaged hijacker passport was found on an NYC street after the massive, fiery destruction of the skyscrapers is totally absurd, as was the claim that the top hijacker conveniently lost his luggage at one of the airports and it was found to contain a large mass of incriminating information. The testimonies of the dozens of firefighters who heard explosions just before the collapse of the buildings seems totally inexplicable under the official account. The sudden total collapse of Building Seven, never hit by any jetliners is also extremely implausible.

## The 9/11 Attacks – Who Did It?

Let us now suppose that the overwhelming weight of evidence is correct, and concur with high-ranking former CIA intelligence analysts, distinguished academics, and experienced professionals that the 9/11 attacks were not what they appeared to be. We recognize the extreme implausibility that three huge skyscrapers in New York City suddenly collapsed at free-fall velocity into their own footprints after just two of them were hit by airplanes, and also that a large civilian jetliner probably did not strike the Pentagon leaving behind absolutely no wreckage and only a small hole. What actually did happen, and more importantly, who was responsible?

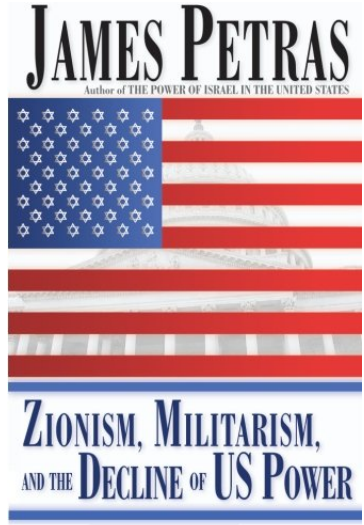
The first question is obviously impossible to answer without an honest and thorough official investigation of the evidence. Until that occurs, we should not be surprised that numerous, somewhat conflicting hypotheses have been advanced and debated within

the confines of the 9/11 Truth community. But the second question is probably the more important and relevant one, and I think it has always represented a source of extreme vulnerability to 9/11 Truthers.

The most typical approach, as generally followed in the numerous Griffin books, is to avoid the issue entirely and focus solely on the gaping flaws in the official narrative. This is a perfectly acceptable position but leaves all sorts of serious doubts. What organized group would have been sufficiently powerful and daring to carry off an attack of such vast scale against the central heart of the world's sole superpower? And how were they possibly able to orchestrate such a massively effective media and political cover-up, even enlisting the participation of the U.S. government itself?

The much smaller fraction of 9/11 Truthers who choose to address this "whodunit" question seem to be overwhelmingly concentrated among rank-and-file grassroots activists rather than the prestigious experts, and they usually answer "inside job!" Their widespread belief seems to be that the top political leadership of the Bush Administration, probably including Vice President Dick Cheney and Defense Secretary Donald Rumsfeld, had organized the terrorist attacks, either with or without the knowledge of their ignorant nominal superior, President George W. Bush. The suggested motives included justifying military attacks against various countries, supporting the financial interests of the powerful oil industry and military-industrial complex, and enabling the destruction of traditional American civil liberties. Since the vast majority of politically-active Truthers seem to come from the far left of the ideological spectrum, they regard these notions as logical and almost self-evident.

Although not explicitly endorsing those Truther conspiracies, filmmaker Michael Moore's leftist box office hit *Fahrenheit 9/11* seemed to raise such similar suspicions. His small budget documentary earned an astonishing $220 million by suggesting that the very close business ties between the Bush family, Cheney, the oil companies, and the Saudis were responsible for the Iraq War aftermath of the terrorist attacks, as well as the domestic crackdown on civil liberties, which was part-and-parcel of the right-wing Republican agenda.a



Unfortunately, this apparently plausible picture seems to have almost no basis in reality. During the drive to the Iraq War, I read *Times* articles interviewing numerous top oil men in Texas who expressed total puzzlement at why America was planning to attack Saddam, saying that they could only assume that President Bush knew something that they themselves did not. Saudi Arabian leaders were adamantly opposed to an American attack on Iraq, and made every effort to prevent it. Prior to his joining the Bush Administration, Cheney had served as CEO of Halliburton, an oil services giant, and his firm had heavily lobbied for the lifting of U.S. economic sanctions against Iraq. Prof. James Petras, a scholar of strong Marxist leanings, published an excellent 2008 book entitled *Zionism, Militarism, and the Decline of US Power* in which he conclusively demonstrated that Zionist interests rather than those of the oil industry had dominated the Bush Administration in the wake of the 9/11 attacks, and promoted the Iraq War.

As for the Michael Moore film, I remember at the time sharing a laugh with a (Jewish) friend of mine, both of us finding it ridiculous that a government so overwhelmingly permeated by fanatically pro-Israel Neocons was being portrayed as being in thrall to the Saudis. Not only did the plotline of Moore's film demonstrate the fearsome power of Jewish Hollywood, but its huge success suggested that most of the American public had apparently never heard of the Neocons.

Bush critics properly ridiculed the president for his tongue-tied statement that the 9/11 terrorists had attacked America "for its

freedoms" and Truthers have reasonably branded as implausible the claims that the massive attacks were organized by a cave-dwelling Islamic preacher. But the suggestion that they were led and organized by the top figures of the Bush Administration seems even more preposterous.

Cheney and Rumsfeld had both spent decades as stalwarts of the moderate pro-business wing of the Republican Party, each serving in top government positions and also as CEOs of major corporations. The notion that they capped their careers by joining a new Republican administration in early 2001 and almost immediately set about organizing a gigantic false-flag terrorist attack upon the proudest towers of our largest city together with our own national military headquarters, intending to kill many thousands of Americans in the process, is too ridiculous to even be part of a leftist political satire.

Let's step back a bit. In the entire history of the world, I can think of no documented case in which the top political leadership of a country has launched a major false-flag attack upon its own centers of power and finance and tried to kill large numbers of its own people. The America of 2001 was a peaceful and prosperous country run by relatively bland political leaders focused upon the traditional Republican goals of enacting tax-cuts for the rich and reducing environmental regulations. Too many Truther activists have apparently drawn their understanding of the world from the caricatures of leftist comic-books in which corporate Republicans are all diabolical Dr. Evils, seeking to kill Americans out of sheer malevolence, and Alexander Cockburn was absolutely correct to ridicule them at least on that particular score.

Consider also the simple practicalities of the situation. The gigantic nature of the 9/11 attacks as postulated by the Truth movement would have clearly required enormous planning and probably involved the work of many dozens or even hundreds of skilled agents. Ordering CIA operatives or special military units to organize secret attacks against civilian targets in Venezuela or Yemen is one thing, but directing them to mount attacks against the Pentagon and the heart of New York City would be fraught with stupendous risk.

Bush had lost the popular vote in November 2000 and had only reached the White House because of a few dangling chads in

Florida and the controversial decision of a deeply divided Supreme Court. As a consequence, most of the American media regarded his new administration with enormous hostility. If the first act of such a newly-sworn presidential team had been ordering the CIA or the military to prepare attacks against New York City and the Pentagon, surely those orders would have been regarded as issued by a group of lunatics, and immediately leaked to the hostile national press.

The whole scenario of top American leaders being the masterminds behind 9/11 is beyond ridiculous, and those 9/11 Truthers who make or imply such claims—doing so without a single shred of solid evidence—have unfortunately played a major role in discrediting their entire movement. In fact, the common meaning of the "inside job" scenario is so patently absurd and self-defeating that one might even suspect that the claim was encouraged by those seeking to discredit the entire 9/11 Truth movement as a consequence.

The focus on Cheney and Rumsfeld seems particularly ill-directed. Although I've never met nor had any dealings with either of those individuals, I was quite actively involved in DC politics during the 1990s, and can say with some assurance that prior to 9/11, neither of them were regarded as Neocons. Instead, they were the archetypical examples of moderate business-type mainstream Republicans, stretching all the way back to their years at the top of the Ford Administration during the mid-1970s.

Skeptics of this claim may note that they signed the 1997 declaration issued by the Project for the New American Century (PNAC), a leading Neocon foreign policy manifesto organized by Bill Kristol, but I would regard that as something of a red herring. In DC circles, individuals are always recruiting their friends to sign various declarations, which may or may not be indicative of anything, and I remember Kristol trying to get me to sign the PNAC statement as well. Since my private views on that issue were absolutely 100% contrary to the Neocon position, which I regarded as foreign policy lunacy, I deflected his request and very politely turned him down. But I was quite friendly with him at the time, so if I had been someone without strong opinions in that area, I probably would have agreed.

This raises a larger point. By 2000, the Neocons had gained almost total control of all the major conservative/Republican

media outlets and the foreign policy wings of nearly all the similarly aligned thinktanks in DC, successfully purging most of their traditional opponents. So although Cheney and Rumsfeld were not themselves Neocons, they were swimming in a Neocon sea, with a very large fraction of all the information they received coming from such sources and with their top aides such as "Scooter" Libby, Paul Wolfowitz, and Douglas Feith being Neocons. Rumsfeld was already somewhat elderly while Cheney had suffered several heart-attacks starting at age 37, so under those circumstances it may have been relatively easy for them to be shifted toward certain policy positions.

Indeed, the entire demonization of Cheney and Rumsfeld in anti-Iraq War circles has seemed somewhat suspicious to me. I always wondered whether the heavily Jewish liberal media had focused its wrath upon those two individuals in order to deflect culpability from the Jewish Neocons who were the obvious originators of that disastrous policy; and the same may be true of the 9/11 Truthers, who probably feared accusations of anti-Semitism. Regarding that former issue, a prominent Israeli columnist was characteristically blunt on the matter in 2003, strongly suggesting that 25 Neocon intellectuals, nearly all of them Jewish, were primarily responsible for the war. Under normal circumstances, the president himself would have surely been portrayed as the evil mastermind behind the 9/11 plot, but "W" was too widely known for his ignorance for such accusations to be credible.

It does seem entirely plausible that Cheney, Rumsfeld, and other top Bush leaders may have been manipulated into taking certain actions that inadvertently fostered the 9/11 plot, while a few lower-level Bush appointees might have been more directly involved, perhaps even as outright conspirators. But I do not think this is the usual meaning of the "inside job" accusation.

So where do we now stand? It seems very likely that the 9/11 attacks were the work of an organization far more powerful and professionally-skilled than a rag-tag band of nineteen random Arabs armed with box-cutters, but also that the attacks were very unlikely to have been the work of the American government itself. So who actually attacked our country on that fateful day seventeen years ago, killing thousands of our fellow citizens?

Effective intelligence operations are concealed in a hall of mirrors, often extremely difficult for outsiders to penetrate, and false-flag terrorist attacks certainly fall into this category. But if we apply a different metaphor, the complexities of such events may be seen as a Gordian Knot, almost impossible to disentangle, but vulnerable to the sword-stroke of asking the simple question "Who benefited?"

America and most of the world certainly did not, and the disastrous legacies of that fateful day have transformed our own society and wrecked many other countries. The endless American wars soon unleashed have already cost us many trillions of dollars and set our nation on the road to bankruptcy while killing or displacing many millions of innocent Middle Easterners. Most recently, that resulting flood of desperate refugees has begun engulfing Europe, and the peace and prosperity of that ancient continent is now under severe threat.

Our traditional civil liberties and constitutional protections have been drastically eroded, with our society having taken long steps toward becoming an outright police state. American citizens now passively accept unimaginable infringements on their personal freedoms, all originally begun under the guise of preventing terrorism.

I find it difficult to think of any country in the world that clearly gained as a result of the 9/11 attacks and America's military reaction, with one single, solitary exception.

During 2000 and most of 2001, America was a peaceful prosperous country, but a certain small Middle Eastern nation had found itself in an increasingly desperate situation. Israel then seemed to be fighting for its life against the massive waves of domestic terrorism that constituted the Second Palestinian Intifada.

Ariel Sharon was widely believed to have deliberately provoked that uprising in September 2000 by marching to the Temple Mount backed by a thousand armed police, and the resulting violence and polarization of Israeli society had successfully installed him as Prime Minister in early 2001. But once in office, his brutal measures failed to end the wave of continuing attacks, which increasingly took the form of suicide-bombings against civilian targets. Many believed that the violence might soon trigger a huge outflow of Israeli citizens, perhaps producing a

death-spiral for the Jewish state. Iraq, Iran, Libya, and other major Muslim powers were supporting the Palestinians with money, rhetoric, and sometimes weaponry, and Israeli society seemed close to crumbling. I remember hearing from some of my DC friends that numerous Israeli policy experts were suddenly seeking berths at Neocon thinktanks so that they could relocate to America.

Sharon was a notoriously bloody and reckless leader, with a long history of undertaking strategic gambles of astonishing boldness, sometimes betting everything on a single roll of the dice. He had spent decades seeking the Prime Ministership, but having finally obtained it, he now had his back to the wall, with no obvious source of rescue in sight.

The 9/11 attacks changed everything. Suddenly the world's sole superpower was fully mobilized against Arab and Muslim terrorist movements, especially those connected with the Middle East. Sharon's close Neocon political allies in America used the unexpected crisis as an opportunity to seize control of America's foreign policy and national security apparatus, with an NSA staffer later reporting that Israeli generals freely roamed the halls of the Pentagon without any security controls. Meanwhile, the excuse of preventing domestic terrorism was used to implement newly centralized American police controls that were soon employed to harass or even shut down various anti-Zionist political organizations. One of the Israeli Mossad agents arrested by the police in New York City as he and his fellows were celebrating the 9/11 attacks and producing a souvenir film of the burning World Trade Center towers told the officers that "We are Israelis…Your problems are our problems." And so they immediately became.

General Wesley Clark reported that soon after the 9/11 attacks he was informed that a secret military plan had somehow come into being under which America would attack and destroy seven major Muslim countries over the next few years, including Iraq, Iran, Syria, and Libya, which coincidentally were all of Israel's strongest regional adversaries and the leading supporters of the Palestinians. As America began to expend enormous oceans of blood and treasure attacking all of Israel's enemies after 9/11, Israel itself no longer needed to do so. Partly as a consequence, almost no other nation in the world has so enormously improved its strategic and economic situation during the last seventeen years, even while a large fraction of the American population has

become completely impoverished during that same period and our national debt has grown to insurmountable levels. A parasite can often grow fat even as its host suffers and declines.

I have emphasized that for many years after the 9/11 attacks I paid little attention to the details and had only the vaguest notion that there even existed an organized 9/11 Truth movement. But if someone had ever convinced me that the terrorist attacks had been false-flag operations and someone other than Osama had been responsible, my immediate guess would have been Israel and its Mossad.

Certainly no other nation in the world can remotely match Israel's track-record of remarkably bold high-level assassinations and false-flag attacks, terrorist and otherwise, against other countries, even including America and its military. Furthermore, the enormous dominance of Jewish and pro-Israel elements in the American establishment media and increasingly that of many other major countries in the West has long ensured that even when the solid evidence of such attacks was discovered, very few ordinary Americans would ever hear those facts.

Once we accept that the 9/11 attacks were probably a false-flag operation, a central clue to the likely perpetrators has been their extraordinary success in ensuring that such a wealth of enormously suspicious evidence has been totally ignored by virtually the entire American media, whether liberal or conservative, left-wing or right-wing.

In the particular case at hand, the considerable number of zealously pro-Israel Neocons situated just beneath the public surface of the Bush Administration in 2001 could have greatly facilitated both the successful organization of the attacks and their effective cover-up and concealment, with Libby, Wolfowitz, Feith, and Richard Perle being merely the most obvious names. Whether such individuals were knowing conspirators or merely had personal ties allowing them to be exploited in furthering the plot is entirely unclear.

Most of this information must surely have long been apparent to knowledgeable observers, and I strongly suspect that many individuals who had paid much greater attention than myself to the details of the 9/11 attacks may have quickly formed a

tentative conclusion along these same lines. But for obvious social and political reasons, there is a great reluctance to publicly point the finger of blame towards Israel on a matter of such enormous magnitude. Hence, except for a few fringe activists here and there, such dark suspicions remained private.

Meanwhile, the leaders of the 9/11 Truth movement probably feared they would be destroyed by media accusations of deranged anti-Semitism if they had ever expressed even a hint of such ideas. This political strategy may have been necessary, but by failing to name any plausible culprit, they created a vacuum that was soon filled by "useful idiots" who shouted "inside job!" while pointing an accusing finger toward Cheney and Rumsfeld, and thereby did so much to discredit the entire 9/11 Truth movement.

This unfortunate conspiracy of silence finally ended in 2009 when Dr. Alan Sabrosky, former Director of Studies at the US Army War College, stepped forward and publicly declared that the Israeli Mossad had very likely been responsible for the 9/11 attacks, writing a series of columns on the subject, and eventually presenting his views in a number of media interviews, along with additional analyses.

Obviously, such explosive charges never reached the pages of my morning *Times*, but they did receive considerable if transitory coverage in portions of the alternative media, and I remember seeing the links very prominently featured at *Antiwar.com* and widely discussed elsewhere. I had never previously heard of Sabrosky, so I consulted my archiving system and immediately discovered that he had a perfectly respectable record of publication on military affairs in mainstream foreign policy periodicals and had also held a series of academic appointments at prestigious institutions. Reading one or two of his articles on 9/11, I felt he made a rather persuasive case for Mossad involvement, with some of his information already known to me but much of it not.

Since I was very busy with my software work and had never spent any time investigating 9/11 or reading any of the books on the topic, my belief in his claims back then was obviously quite tentative. But now that I have finally looked into the topic in much greater detail and done a great deal of reading, I think it seems quite likely that his 2009 analysis was entirely correct.

I would particularly recommend his long 2011 interview on Iranian Press TV, which I first watched just a couple of days ago. He came across as highly credible and forthright in his claims:

I have had long conversations over the last two weeks with contacts at the Army War College and the headquarters, Marine Corps and I've made it absolutely clear in both cases that it is 10
rtain
that 9/11 was a Mossa
ation
Period
The Zionists are playing this as an all-or-nothing exercise
If they lose this one, they're done..
Alan Sabrosky
US Army War College Retired

He also provided a pugnacious conclusion in a much longer 2010 radio interview:

Sabrosky focused much of his attention upon a particular segment of a Dutch documentary film on the 9/11 attacks produced several years earlier. In that fascinating interview, a professional demolition expert named Danny Jowenko who was largely ignorant of the 9/11 attacks immediately identified the filmed collapse of WTC Building 7 as a controlled-demolition, and the remarkable clip was broadcast worldwide on *Press TV* and widely discussed across the Internet.

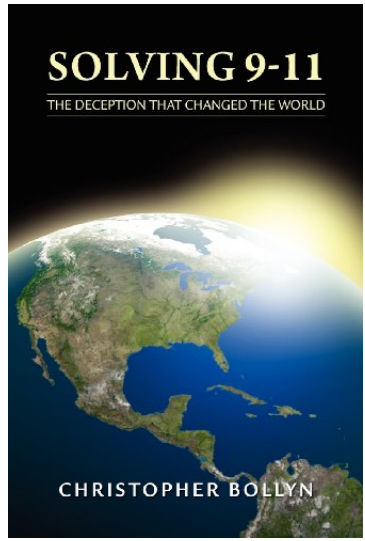
And by a very strange coincidence, just three days after Jowenko's broadcast video interview had received such heavy attention, he had the misfortune to die in a frontal collision with a tree in Holland. I'd suspect that the community of professional demolition experts is a small one, and Jowenko's surviving industry colleagues may have quickly concluded that serious misfortune might visit those who rendered controversial expert opinions on the collapse of the three World Trade Center towers.

Meanwhile, the ADL soon mounted a huge and largely successful effort to have *Press TV* banned in the West for promoting "anti-Semitic conspiracy theories," even persuading YouTube to entirely eliminate the huge video archive of those past shows, notably including Sabrosky's long interview.

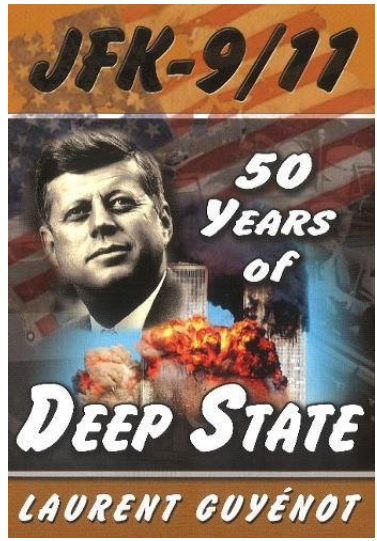
Most recently, Sabrosky provided an hour-long presentation at this June's Deep Truth video panel conference, during which he expressed considerable pessimism about America's political predicament, and suggested that the Zionist control over our politics and media had grown even stronger over the last decade.

His discussion was soon rebroadcast by *Guns & Butter*, a prominent progressive radio program, which as a consequence was soon purged from its home station after seventeen years of great national popularity and strong listener support.

The late Alan Hart, a very distinguished British broadcast journalist and foreign correspondent, also broke his silence in 2010 and similarly pointed to the Israelis as the likely culprits behind the 9/11 attacks. Those interested may wish to listen to his extended interview.

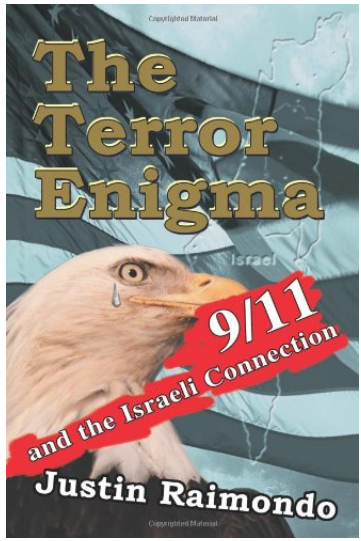


Journalist Christopher Bollyn was one of the first writers to explore the possible Israeli links to the 9/11 attacks, and the details contained in his long series of newspaper articles are often quoted by other researchers. In 2012, he gathered together this material and published it in the form of a book entitled *Solving 9-11*, thereby making his information on the possible role of the Israeli Mossad available to a much wider audience, with a version being available online. Unfortunately his printed volume severely suffers from the typical lack of resources available to the writers on the political fringe, with poor organization and frequent repetition of the same points due to its origins in a set of individual articles, and this may diminish its credibility among some readers. So those who purchase it should be forewarned about these serious stylistic weaknesses.



Probably a much better compendium of the very extensive evidence pointing to the Israeli hand behind the 9/11 attacks has been more recently provided by French writer Laurent Guyénot, both in his 2017 book *JFK-9/11: 50 Years of the Deep State* and also his 8,500 word article "9/11 was an Israeli Job", published concurrently with this one and providing a far greater wealth of detail than is contained here. While I would not necessarily endorse all of his claims and arguments, his overall analysis seems fully consistent with my own.

These writers have provided a great deal of material in support of the Israeli Mossad Hypothesis, but I would focus attention on just one important point. We would normally expect that terrorist attacks resulting in the complete destruction of three gigantic office buildings in New York City and an aerial assault on the Pentagon would be an operation of enormous size and scale, involving very considerable organizational infrastructure and manpower. In the aftermath of the attacks, the US government undertook great efforts to locate and arrest the surviving Islamic conspirators, but scarcely managed to find a single one. Apparently, they had all died in the attacks themselves or otherwise simply vanished into thin air.



But without making much effort at all, the American government did quickly round up and arrest some 200 Israeli Mossad agents, many of whom had been based in exactly the same geographical locations as the purported 19 Arab hijackers. Furthermore, NYC police arrested some of these agents while they were publicly celebrating the 9/11 attacks, and others were caught driving vans in the New York area containing explosives or their residual traces. Most of these Mossad agents refused to answer any questions, and many of those who did failed polygraph tests, but under massive political pressure all were eventually released and deported back to Israel. A couple of years ago, much of this information was very effectively presented in a short video available on YouTube.

There is another fascinating tidbit that I have very rarely seen

mentioned. Just a month after the 9/11 attacks, two Israelis were caught sneaking weapons and explosives into the Mexican Parliament building, a story that naturally produced several banner-headlines in leading Mexican newspapers at the time but which was greeted by total silence in the American media. Eventually, under massive political pressure, all charges were dropped and the Israeli agents were deported back home. This remarkable incident was only reported on a small Hispanic-activist website, and discussed in a few other places. Some years ago I easily found the scanned front pages of the Mexican newspapers reporting those dramatic events on the Internet, but I can no longer easily locate them. The details are obviously somewhat fragmentary and possibly garbled, but certainly quite intriguing.

One might speculate that if supposed Islamic terrorists had followed up their 9/11 attacks by attacking and destroying the Mexican parliament building a month later, Latin American support for America's military invasions in the Middle East would have been greatly magnified. Furthermore, any scenes of such massive destruction in the Mexican capital by Arab terrorists would surely have been broadcast non-stop on *Univision*, America's dominant Spanish-language network, fully solidifying Hispanic support for President Bush's military endeavors.

Although my growing suspicions about the 9/11 attacks stretch back a decade or more, my serious investigation of the topic is quite recent, so I am certainly a newcomer to the field. But sometimes an outsider can notice things that may escape the attention of those who have spent so many years deeply immersed in a given topic.

From my perspective, a huge fraction of the 9/11 Truth community spends far too much of its time absorbed in the particular details of the attacks, debating the precise method by which the World Trade Center towers in New York were brought down or what actually struck the Pentagon. But these sorts of issues seem of little ultimate significance.

I would argue that the only important aspect of such technical issues is whether the overall evidence is sufficiently strong to establish the falsehood of the official 9/11 narrative and also demonstrate that the attacks must have been the work of a highly

sophisticated organization with access to advanced military technology rather than a rag-tag band of 19 Arabs armed with box-cutters. Beyond that, none of those details matter.

In that regard, I believe that the volume of factual material collected by determined researchers over the last seventeen years has easily met that requirement, perhaps even ten or twenty times over. For example, even agreeing upon a single particular item such as the clear presence of nano-thermite, a military-grade explosive compound, would immediately satisfy those two criteria. So I see little point in endless debates over whether nano-thermite was used, or nano-thermite plus something else, or just something else entirely. And such complex technical debates may serve to obscure the larger picture, while confusing and intimidating any casually-interested onlookers, thereby being quite counter-productive to the overall goals of the 9/11 Truth movement.

Once we have concluded that the culprits were part of a highly sophisticated organization, we can then focus on the *Who* and the *Why*, which surely would be of greater importance than the particular details of the *How*. Yet currently all the endless debate over the *How* tends to crowd out the *Who* and the *Why*, and I wonder whether this unfortunate situation might even be intentional.

Perhaps one reason is that once sincere 9/11 Truthers do focus on those more important questions, the vast weight of the evidence clearly points in a single direction, implicating Israel and its Mossad intelligence service, with the case being overwhelmingly strong in motive, means, and opportunity. And leveling accusations of blame at Israel and its domestic collaborators for the greatest attack ever launched against America on our own soil entails enormous social and political risks.

But such difficulties must be weighed against the reality of three thousand American civilian lives and the subsequent seventeen years of our multi-trillion-dollar wars, which have produced tens of thousands of dead or wounded American servicemen and the death or displacement of many millions of innocent Middle Easterners.

The members of the 9/11 Truth movement must therefore ask themselves whether or not “Truth” is indeed the central goal of their efforts.

## Important Historical Realities, Long Hidden in Plain Sight

Many of the events discussed above were among the most important in modern American history, and the evidence supporting the controversial analysis provided seems quite substantial. Numerous contemporary observers would certainly have been aware of at least some of the key information, so serious media investigations should have been launched that would have soon unearthed much of the remaining material. Yet nothing like that happened at the time, and even today the vast majority of Americans remain totally ignorant of these long-established facts.

This paradox is explained by the overwhelming political and media influence of the ethnic and ideological partisans of Israel, which ensured that certain questions were not asked nor crucial points raised. Throughout the second half of the twentieth century, our understanding of the world was overwhelmingly shaped by our centralized electronic media, which was almost entirely in Jewish hands during this period, with all three television networks and eight of nine major Hollywood studios being owned or controlled by such individuals, along with most of our leading newspapers and publishing houses. As I wrote a couple of years ago:

> We naively tend to assume that our media accurately reflects the events of our world and its history, but instead what we all too often see are only the tremendously distorted images of a circus fun-house mirror, with small items sometimes transformed into large ones, and large ones into small. The contours of historical reality may be warped into almost unrecognizable shapes, with some important elements completely disappearing from the record and others appearing out of nowhere. I've often suggested that the media creates our reality, but given such glaring omissions and distortions, the reality produced is often largely fictional.

Only the rise of the decentralized Internet over the last couple of decades has allowed the widespread and unfiltered distribution of the information needed for serious investigation of these important incidents. Without the Internet virtually none of the material I have discussed at such length would ever have become known to me. Ostrovsky may have ranked as a #1 *New York Times* bestselling author with a million copies of his books in print, but before the Internet I never would have heard of him.

Once we pierce the concealing veil of media obfuscation and distortion, some realities of the post-war era become clear. The extent to which the agents of the Jewish state and its Zionist predecessor organizations have engaged in the most rampant international crime and violations of the accepted rules of warfare is really quite extraordinary, perhaps having few parallels in modern world history. Their use of political assassination as a central tool of their statecraft even recalls the notorious activities of the Old Man of the Mountains of the 13th century Middle East, whose deadly techniques gave us the very word “assassin.”

To some extent, the steadily rising trajectory of Israel’s international misbehavior may be a natural result of the total impunity its leaders have long enjoyed, almost never suffering any adverse consequences from their actions. A petty thief may graduate into burglary and then armed-robbery and murder if he comes to believe that he is entirely immune from any judicial sanction.

During the 1940s, Zionist leaders organized massive terrorist attacks against Western targets and assassinated high-ranking British and United Nations officials, but never paid any serious political price. Their likely killing of America’s first defense secretary and their earlier attempt upon the life of our president were entirely covered up by our complicit media. In the mid-1950s, the leadership of newly-established Israel embarked upon a series of false-flag terrorist attacks against American targets during the Lavon Affair, and even when their agents were caught and their plot revealed, they received no punishment. Given such a track-record, perhaps we should not be surprised that they then became sufficiently emboldened to probably orchestrate the assassination of President John F. Kennedy, whose successful elimination gave them unprecedented influence over the world’s leading superpower.

During the notorious Tonkin Gulf Incident of 1964, a U.S. ship involved in hostile activities off the coast of Vietnam was attacked by North Vietnamese torpedo boats. Our vessel suffered little damage and no casualties, but the American military retaliation unleashed a decade of warfare, eventually resulting in the destruction of most of that country and perhaps two million Vietnamese deaths.

By contrast, when the U.S.S. Liberty was deliberately attacked in international waters by Israeli forces in 1967, an attack that killed or wounded more than 200 American servicemen, the only response of

that same American government was massive suppression of the facts, followed by an increase in financial support to the Jewish state. The decades that followed saw numerous major attacks by Israel and its Mossad against American officials and our intelligence service, eventually crowned in 1991 by yet another assassination plot against an insufficiently pliable American president. But our only reaction during this period was steadily-increasing political subservience. Given such a pattern of response, the huge 2001 gamble that the Israeli government finally may have taken by organizing the massive 9/11 false-flag terrorist attacks against our country becomes much more understandable.

Although more than seven decades of almost complete impunity has certainly been a necessary factor behind Israel's remarkable willingness to rely so heavily upon assassination and terrorism in achieving its geopolitical objectives, religious and ideological factors may also play a significant role. In 1943, future Israeli Prime Minister Yitzhak Shamir made a rather telling assertion in his official Zionist publication:

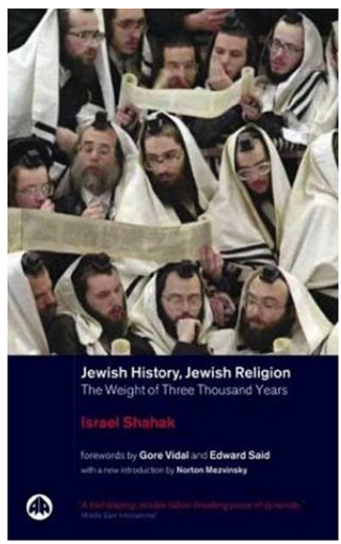
> ﷺNeither Jewish ethics nor Jewish tradition can disqualify terrorism as a means of combat. We are very far from having any moral qualms as far as our national war goes. We have before us the command of the Torah, whose morality surpasses that of any other body of laws in the world: ﷺYe shall blot them out to the last man.'ﷺ

Neither Shamir nor any other early Zionist leader adhered to traditional Judaism, but anyone who investigates the true tenets of that particular religious faith would have to admit that his claims were correct. As I wrote in 2018:

> If these ritualistic issues constituted the central features of traditional religious Judaism, we might regard it as a rather colorful and eccentric survival of ancient times. But unfortunately, there is also a far darker side, primarily involving the relationship between Jews and non-Jews, with the highly derogatory term *goyim* frequently used to describe the latter. To put it bluntly, Jews have divine souls and *goyim* do not, being merely beasts in the shape of men. Indeed, the primary reason for the existence of non-Jews is to serve as the slaves of Jews, with some very high-ranking rabbis occasionally stating this well-known fact. In 2010, Israel's top Sephardic rabbi used his weekly

sermon to declare that the only reason for the existence of non-Jews is to serve Jews and do work for them. The enslavement or extermination of all non-Jews seems an ultimate implied goal of the religion.

Jewish lives have infinite value, and non-Jewish ones none at all, which has obvious policy implications. For example, in a published article a prominent Israeli rabbi explained that if a Jew needed a liver, it would be perfectly fine, and indeed obligatory, to kill an innocent Gentile and take his. Perhaps we should not be too surprised that today Israel is widely regarded as one of the world centers of organ-trafficking.



Jewish History, Jewish Religion
The Weight of Three Thousand Years
Israel Shahak
forewords by Gore Vidal and Edward Said
with a new introduction by Norton Mezvinsky

My encounter a decade ago with Shahak's candid description of the true doctrines of traditional Judaism was certainly one of the most world-altering revelations of my entire life. But as I gradually digested the full implications, all sorts of puzzles and disconnected facts suddenly became much more clear. There were also some remarkable ironies, and not long afterward I joked to a (Jewish) friend of mine that I'd suddenly discovered that Nazism could best be described as "Judaism for Wimps" or perhaps Judaism as practiced by Mother Teresa of Calcutta.

It is important to keep in mind that nearly all of Israel's top leaders have been strongly secular in their views, with none of them being followers of traditional Judaism. Indeed, many of the early Zionists were rather hostile to religion, which they despised due to their Marxist beliefs. However, I have noted that these underlying religious

doctrines may still exert considerable real-world influence:

> Obviously the Talmud is hardly regular reading among ordinary Jews these days, and I would suspect that except for the strongly Orthodox and perhaps most rabbis, barely a sliver are aware of its highly controversial teachings. But it is important to keep in mind that until just a few generations ago, almost all European Jews were deeply Orthodox, and even today I would guess that the overwhelming majority of Jewish adults had Orthodox grandparents. Highly distinctive cultural patterns and social attitudes can easily seep into a considerably wider population, especially one that remains ignorant of the origin of those sentiments, a condition enhancing their unrecognized influence. A religion based upon the principal of "Love Thy Neighbor" may or may not be workable in practice, but a religion based upon "Hate Thy Neighbor" may be expected to have long-term cultural ripple effects that extend far beyond the direct community of the deeply pious. If nearly all Jews for a thousand or two thousand years were taught to feel a seething hatred toward all non-Jews and also developed an enormous infrastructure of cultural dishonesty to mask that attitude, it is difficult to believe that such an unfortunate history has had absolutely no consequences for our present-day world, or that of the relatively recent past.

Countries practicing a variety of different religious and cultural beliefs have sometimes undertaken military attacks involving massive civilian casualties or employed assassination as a tactic. But such methods are considered abhorrent and immoral by a society founded upon universalist principles, and although these ethical scruples may sometimes be overwhelmed by political expediency, they might act as a partial restriction against the widespread adoption of those practices.

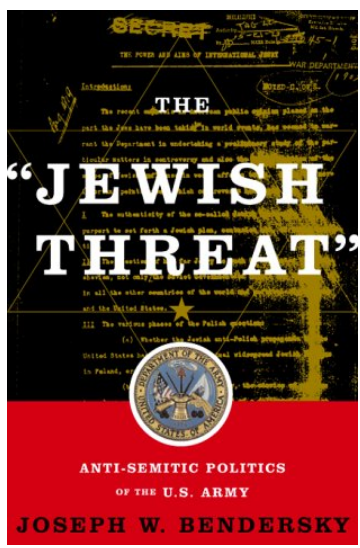
By contrast, actions that lead to the suffering or death of unlimited numbers of innocent Gentiles carry absolutely no moral opprobrium within the religious framework of traditional Judaism, with the only constraints being the risk of detection and retaliatory punishment. Only a fraction of today's Israeli population may explicitly reason in such extremely harsh terms, but the underlying religious doctrine implicitly permeates the entire ideology of the Jewish state.

## The Past Perspective of American Military Intelligence

The major historical events discussed in this long article have shaped our present-day world, and the 9/11 attacks in particular may have set America on the road to national bankruptcy while leading to the loss of many of our traditional civil liberties. Although I think that my interpretation of these various assassinations and terrorist attacks is probably correct, I do not doubt that most present-day Americans would find my controversial analysis shocking and probably respond with extreme skepticism.

Yet oddly enough, if this same material were presented to those individuals who had led America's nascent national security apparatus in the early decades of the twentieth century, I think they would have regarded this historical narrative as very disheartening but hardly surprising.

Last year I happened to read a fascinating volume published in 2000 by historian Joseph Bendersky, a specialist in Holocaust Studies, and discussed his remarkable findings in a lengthy article:

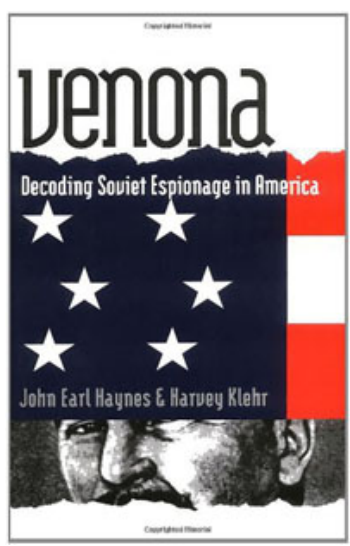


Bendersky devoted ten full years of research to his book, exhaustively mining the archives of American Military Intelligence as well as the personal papers and correspondence of more than 100 senior military figures and intelligence officers. *The "Jewish Threat"* runs over 500 pages, including some 1350 footnotes, with the listed archival sources alone occupying seven full pages. His subtitle is "Anti-Semitic Politics of the U.S. Army" and he makes an extremely compelling case that during the first half of the twentieth century and even afterward, the top ranks of

the U.S. military and especially Military Intelligence heavily subscribed to notions that today would be universally dismissed as “anti-Semitic conspiracy theories.”

Put simply, U.S. military leaders in those decades widely believed that the world faced a direct threat from organized Jewry, which had seized control of Russia and similarly sought to subvert and gain mastery over America and the rest of Western civilization.

Although Bendersky’s claims are certainly extraordinary ones, he provides an enormous wealth of compelling evidence to support them, quoting or summarizing thousands of declassified Intelligence files, and further supporting his case by drawing from the personal correspondence of many of the officers involved. He conclusively demonstrates that during the very same years that Henry Ford was publishing his controversial series *The International Jew*, similar ideas, but with a much sharper edge, were ubiquitous within our own Intelligence community. Indeed, whereas Ford mostly focused upon Jewish dishonesty, malfeasance, and corruption, our Military Intelligence professionals viewed organized Jewry as a deadly threat to American society and Western civilization in general. Hence the title of Bendersky’s book.



The Venona Project constituted the definitive proof of the massive extent of Soviet espionage activities in America, which for many decades had been routinely denied by many mainstream journalists and historians, and it also played a crucial secret role

in dismantling that hostile spy network during the late 1940s and early 1950s. But Venona was nearly snuffed out just a year after its birth. In 1944 Soviet agents became aware of the crucial code-breaking effort, and soon afterwards arranged for the Roosevelt White House to issue a directive ordering the project shut down and all efforts to uncover Soviet spying abandoned. The only reason that Venona survived, allowing us to later reconstruct the fateful politics of that era, was that the determined Military Intelligence officer in charge of the project risked a court-martial by directly disobeying the explicit Presidential order and continuing his work.

That officer was Col. Carter W. Clarke, but his place in Bendersky's book is a much less favorable one, being described as a prominent member of the anti-Semitic "clique" who constitute the villains of the narrative. Indeed, Bendersky particularly condemns Clarke for still seeming to believe in the essential reality of the *Protocols* as late as the 1970s, quoting from a letter he wrote to a brother officer in 1977:

> If, and a big—damned big IF, as the Jews claim the Protocols of the Elders of Zion were f—- cooked up by Russian Secret Police, why is it that so much they contain has already come to pass, and the rest so strongly advocated by the *Washington Post* and the *New York Times*.

Our historians must surely have a difficult time digesting the remarkable fact that the officer in charge of the vital Venona Project, whose selfless determination saved it from destruction by the Roosevelt Administration, actually remained a lifelong believer in the importance of the *Protocols of the Elders of Zion*.

Let us take a step back and place Bendersky's findings in their proper context. We must recognize that during much of the era covered by his research, U.S. Military Intelligence constituted nearly the entirety of America's national security apparatus—being the equivalent of a combined CIA, NSA, and FBI—and was responsible for both international and domestic security, although the latter portfolio had gradually been assumed by J. Edgar Hoover's own expanding organization by the end of the 1920s.

Bendersky's years of diligent research demonstrate that for decades these experienced professionals—and many of their top

commanding generals—were firmly convinced that major elements of the organized Jewish community were ruthlessly plotting to seize power in America, destroy all our traditional Constitutional liberties, and ultimately gain mastery over the entire world.

# Our Coronavirus Catastrophe as Biowarfare Blowback?

April 21, 2020 • 7,400 Words

Nearly 30,000 Americans have died from the coronavirus during the last two weeks, and by some estimates this is a substantial under-count, while the death-toll continues to rapidly mount. Meanwhile, measures to control the spread of this deadly infection have already cost 22 million Americans their jobs, an unprecedented economic collapse that has pushed our unemployment rates to Great Depression levels. Our country is facing a crisis as grave as almost any in our national history.

For many weeks President Donald Trump and his political allies had regularly dismissed or minimized this terrible health threat, and suddenly now faced with such a manifest disaster, they have naturally begun seeking other culprits to blame.

The obvious choice is China, where the global epidemic first began in late 2019. Over the last week or two our media has been increasingly filled with accusations that the dishonesty and incompetence of the Chinese government played a major role in producing our own health catastrophe.

Even more serious charges are also being raised, with senior government officials informing the media that they suspect that the Covid-19 virus was developed in a Chinese laboratory in Wuhan and then carelessly released upon a vulnerable world. Such "conspiracy theories" were once confined to the extreme political fringe of the Internet, but they are now found in the respectable pages of my morning *New York Times* and *Wall Street Journal.*

Whether plausible or not, such accusations carry the gravest international implications, and there are growing demands that China should financially compensate our country for its trillions of dollars in economic losses. A new global Cold War along both political and economic lines may soon be at hand.

I have no personal expertise in biowarfare technology, nor access to the secret American intelligence reports that seem to have been taken

seriously by our most elite national newspapers. But I do think that a careful exploration of previous Sino-American clashes over the last couple of decades may provide some useful insight into the relative credibility of those two governments as well as that of our own media.

During the late 1990s, America seemed to reach the peak of its global power and prosperity, basking in the aftermath of our historic victory in the long Cold War, while ordinary Americans greatly benefited from the record-long economic expansion of that decade. A huge Tech Boom was at its height, and Islamic terrorism seemed a vague and distant thing, almost entirely confined to Hollywood movies. With the collapse of the Soviet Union, the possibility of large scale warfare seemed to have dissipated so political leaders boasted of the "peace dividend" that citizens were starting to enjoy as our huge military forces, built up over nearly a half-century, were downsized amid sweeping cuts to the bloated defense budget. America was finally returning to a regular peacetime economy, with the benefits apparent to everyone.

At the time, I was overwhelmingly focused upon domestic political issues, so I only paid slight attention to our one small military operation of that period, the 1999 NATO air war against Serbia, intended to safeguard the Kosovo Albanians from ethnic cleansing and massacre, a Clinton Administration project that I fully endorsed.

Although our limited bombing campaign seemed quite successful and soon forced the Serbs to the bargaining table, the short war did include one very embarrassing mishap. The use of old maps had led to a targeting error that caused one of our smart bombs to accidentally strike the Chinese Embassy in Belgrade, killing three members of its delegation and wounding dozens more. The Chinese were outraged by this incident, and their propaganda organs began claiming that the attack had been deliberate, a reckless accusation that obviously made no logical sense.

In those days I watched the *PBS Newshour* every night, and was I shocked to see their U.S. Ambassador raise those absurd charges with host Jim Lehrer, whose disbelief matched my own. But when I considered that the Chinese government was still stubbornly denying the reality of its massacre of the protesting students in Tiananmen Square a decade earlier, I concluded that unreasonable behavior by PRC officials was only to be expected. Indeed, there was even some speculation that China was cynically milking the unfortunate accident for domestic reasons, hoping to stoke the sort of jingoist anti-Americanism among the Chinese people that would finally help bind

the social wounds of that past 1989 outrage.

Such at least were my thoughts on that matter more than two decades ago. But in the years that followed, my understanding of the world and of many pivotal events of modern history underwent the sweeping transformations that I have described in my *American Pravda* series. And some of my 1990s assumptions were among them.

Consider, for example, the Tiananmen Square Massacre, which every June 4th still evokes an annual wave of harsh condemnations in the news and opinion pages of our leading national newspapers. I had never originally doubted those facts, but a year or two ago I happened to come across a short article by journalist Jay Matthews entitled "The Myth of Tiananmen" that completely upended that apparent reality.

According to Matthews the infamous massacre had likely never happened, but was merely a media artifact produced by confused Western reporters and dishonest propaganda, a mistaken belief that had quickly become embedded in our standard media storyline, endlessly repeated by so many ignorant journalists that they all eventually believed it to be true. Instead, as near as could be determined, the protesting students had all left Tiananmen Square peacefully, just as the Chinese government had always maintained. Indeed, leading newspapers such as the *New York Times* and the *Washington Post* had occasionally acknowledged these facts over the years, but usually buried those scanty admissions so deep in their stories that few had ever noticed. Meanwhile, the bulk of the mainstream media had fallen for an apparent hoax.

Matthews himself had been the Beijing Bureau Chief of the *Washington Post*, personally covering the protests at the time, and his article appeared in the *Columbia Journalism Review*, our most prestigious venue for media criticism. This authoritative analysis containing such explosive conclusions was first published in 1998, and I find it difficult to believe that many reporters or editors covering China have remained ignorant of this information, yet the impact has been absolutely nil. For over twenty years virtually every mainstream media account I have read has continued to promote the Tiananmen Square Massacre Hoax, usually implicitly but sometimes explicitly.

Even more remarkable were the discoveries I made regarding our supposedly accidental bombing of the Chinese Embassy in 1999. Not

long after launching this website, I added former *Asia Times* contributor Peter Lee as a columnist, incorporating his *China Matters* blogsite archives that stretched back for a decade. He soon published a 7,000 word article on the Belgrade Embassy bombing, representing a compilation of material already contained in a half-dozen previous pieces he'd written on that subject from 2007 onward. To my considerable surprise, he provided a great deal of persuasive evidence that the American attack on the Chinese embassy had indeed been deliberate, just as China had always maintained.

According to Lee, Beijing had allowed its embassy to be used as a site for secure radio transmission facilities by the Serbian military, whose own communications network was a primary target of NATO airstrikes. Meanwhile, Serbian air defenses had shot down an advanced American F-117A fighter, whose top-secret stealth technology was a crucial U.S. military secret. Portions of that enormously valuable wreckage were carefully gathered by the grateful Serbs, who delivered the material to the Chinese for temporary storage at their embassy prior to transport back home. This vital technological acquisition later allowed China to deploy its own J20 stealth fighter in early 2011, many years sooner than American military analysts had believed possible.

Based upon this analysis, Lee argued that the Chinese embassy was attacked in order to destroy the Serbian retransmission facilities located there, while punishing the Chinese for allowing such use. There were also widespread rumors in China that another motive had been an unsuccessful attempt to destroy the stealth debris stored within. Later Congressional testimony revealed that the among all the hundreds of NATO airstrikes, the attack on the Chinese embassy was the only one directly ordered by the CIA, a highly-suspicious detail.

I was only slightly familiar with Lee's work, and under normal circumstances I would have been very cautious in accepting his remarkable claims against the contrary position universally held by all our own elite media outlets. But the sources he cited completely shifted that balance.

Although the American media dominates the English-language world, many British publications also possess a strong global reputation, and since they are often much less in thrall to our own national security state, they have sometimes covered important stories that were ignored here. And in this case, the *Sunday Observer* published a remarkable expose in October 1999, citing several NATO military and intelligence sources who fully confirmed the deliberate nature of the

American bombing of the Chinese embassy, with a US colonel even reportedly boasting that their smartbomb had hit the exact room intended.

This important story was immediately summarized in the *Guardian*, a sister publication, and also covered by the rival *Times of London* and many of the world's other most prestigious publications, but encountered an absolute wall of silence in our own country. Such a bizarre divergence on a story of global strategic importance—a deliberate and deadly US attack against Chinese diplomatic territory—drew the attention of FAIR, a leading American media watchdog group, which published an initial critique and a subsequent follow-up. These two pieces totaled some 3,000 words, and effectively summarized both the overwhelming evidence of the facts and also the heavy international coverage, while reporting the weak excuses made by top American editors to explain their continuing silence. Based upon these articles, I consider the matter settled.

Few Americans remember our 1999 attack upon the Chinese embassy in Belgrade, and if not for the annual waving of a bloody June 4th flag by our ignorant and disingenuous media, the "Tiananmen Square Massacre" would also have long since faded from memory. Neither of these events has much direct importance today, at least for our own citizens. But the broader media implications of these examples do seem quite significant.

These incidents represented two of the most serious flashpoints between the Chinese and American governments during the last thirty-odd years. In both cases the claims of the Chinese government were entirely correct, although they were denied by our own top political leaders and dismissed or ridiculed by virtually our entire mainstream media. Moreover, within a few months or a year the true facts became known to many journalists, even being reported in fully respectable venues. But that reality was still completely ignored and suppressed for decades, so that today almost no American whose information comes from our regular media would even be aware of it. Indeed, since many younger journalists draw their knowledge of the world from these same elite media sources, I suspect that many of them have never learned what their predecessors knew but dared not mention.

Most leading Chinese media outlets are owned or controlled by the Chinese government, and they tend to broadly follow the government

line. Leading American media outlets have a corporate ownership structure and often boast of their fierce independence; but on many crucial matters, I think the actual reality is not so very different from that in China.

I tend to doubt that Chinese leaders have any overwhelming commitment to the truth, and the reasons for their greater veracity are probably practical ones. American news and entertainment completely dominate the global media landscape and they face no significant domestic rival. So China recognizes that it is vastly outmatched in any propaganda conflict, and as the far weaker party must necessarily try to stick closer to the truth, lest its lies be immediately exposed. Meanwhile, America's overwhelming control over global information may inspire considerable hubris, with the government sometimes promoting the most outrageous and ridiculous falsehoods in the confident belief that a supportive American media will provide cover for any mistakes.

These considerations should be kept in mind as we attempt to sift the accounts of our often unreliable and dishonest media in hopes of extracting the true circumstances of the current coronavirus epidemic. Unlike careful historical studies, we are working in real-time and our analysis is greatly hindered by the ongoing fog of war, so that any conclusions are necessarily very preliminary ones. But given the high stakes, such an attempt seems warranted.

When my morning newspapers first began mentioning the appearance of a mysterious new illness in China during mid-January, I paid little attention, absorbed as I was in the aftermath of our sudden assassination of Iran's top military leader and the dangerous possibility of a yet another Middle Eastern war. But the reports persisted and grew, with deaths occurring and evidence growing that the viral disease could be transmitted between humans. China's early conventional efforts seemed unsuccessful in halting the spread of the disease.

Then on Jan. 23rd and after only 17 deaths, the Chinese government took the astonishing step of locking down and quarantining the entire 11 million inhabitants of the city of Wuhan, a story that drew worldwide attention. They soon extended this policy to the 60 million Chinese of Hubei province, and not longer afterward shut down their entire national economy and confined 700 million Chinese to their homes, a public health measure probably a thousand times larger than

anything previously undertaken in human history. So either China's leadership had suddenly gone insane, or they regarded this new virus as an absolutely deadly national threat, one that needed to be controlled at any possible cost.

Given these dramatic Chinese actions and the international headlines that they generated, the current accusations by Trump Administration officials that China had attempted to minimize or conceal the serious nature of the disease outbreak is so ludicrous as to defy rationality. In any event, the record shows that on December 31st, the Chinese had already alerted the World Health Organization to the strange new illness, and Chinese scientists published the entire genome of the virus on Jan. 12th, allowing diagnostic tests to be produced worldwide.

Unlike other nations, China had received no advance warning of the nature or existence of the deadly new disease, and therefore faced unique obstacles. But their government implemented public health control measures unprecedented in the history of the world and managed to almost completely eradicate the virus with merely the loss of a few thousand lives. Meanwhile, many other Western countries such as the US, Italy, Spain, France, and Britain dawdled for months and ignored the potential threat, and have now suffered well over 100,000 dead as a consequence, with the toll still rapidly mounting. For any of these nations or their media organs to criticize China for its ineffectiveness or slow response represents an absolute inversion of reality.

Some governments took full advantage of the early warning and scientific information provided by China. Although nearby East Asian nations such as South Korea, Japan, Taiwan, and Singapore had been at greatest risk and were among the first infected, their competent and energetic responses allowed them to almost completely suppress any major outbreak, and they have suffered minimal fatalities. But America and several European countries avoided adopting these same early measures such as widespread testing, quarantine, and contact-tracing, and have paid a terrible price for their insouciance.

A few weeks ago British Prime Minister Boris Johnson boldly declared that his own disease strategy for Britain was based upon rapidly achieving "herd immunity"—essentially encouraging the bulk of his citizens to become infected—then quickly backed away after his desperate advisors recognized that the result might entail a million or more British deaths.

By any reasonable measure, the response to this global health crisis by

China and most East Asian countries has been absolutely exemplary, while that of many Western countries has been equally disastrous. Maintaining reasonable public health has been a basic function of governments since the days of the Sumerian city-states, and the sheer and total incompetence of America and most of its European vassals has been breathtaking. If the Western media attempts to pretend otherwise, it will permanently forfeit whatever remaining international credibility it still possesses.

I do not think these particular facts are much disputed except among the most blinkered partisans, and the Trump Administration probably recognizes the hopelessness of arguing otherwise. This may explain its recent shift towards a far more explosive and controversial narrative, namely claiming that Covid-19 may have been the product of Chinese research into deadly viruses at a Wuhan laboratory, which suggests that the blood of hundreds of thousands or millions of victims around the world will be on Chinese hands. Dramatic accusations backed by overwhelming international media power may deeply resonate across the globe.

News reports appearing in the *Wall Street Journal* and the *New York Times* have been reasonably consistent. Senior Trump Administration officials have pointed to the Wuhan Institute of Virology, a leading Chinese biolab, as the possible source of the infection, with the deadly virus having been accidentally released, subsequently spreading first throughout China and later worldwide. Trump himself has publicly voiced similar suspicions, as did Secretary of State and former CIA Director Mike Pompeo in a *FoxNews* interview. Private lawsuits against China in the multi-trillion-dollar range have already been filed by rightwing activists and Republican senators Tom Cotton and Lindsey Graham have raised similar governmental demands.

I obviously have no personal access to the classified intelligence reports that have been the basis of these charges by Trump, Pompeo, and other top administration officials. But in reading these recent news accounts, I noticed something rather odd.

Back in January, few Americans were paying much attention to the early reports of an unusual disease outbreak in the Chinese city of Wuhan, which was hardly a household name. Instead, overwhelming political attention was focused on the battle over Trump's impeachment and the aftermath of our dangerous military confrontation with Iran. But towards the end of that month, I

discovered that the fringes of the Internet were awash with claims that the disease was caused by a Chinese bioweapon accidentally released from that same Wuhan laboratory, with former Trump advisor Steve Bannon and *ZeroHedge*, a popular right-wing conspiracy-website, playing leading roles in advancing the theory. Indeed, the stories became so widespread in those ideological circles that Sen. Tom Cotton, a leading Republican Neocon, began promoting them on Twitter and FoxNews, thereby provoking an article in the *NYT* on those "fringe conspiracy theories."

I suspect that it may be more than purely coincidental that the biowarfare theories which erupted in such concerted fashion on small political websites and Social Media accounts back in January so closely match those now publicly advocated by top Trump Administration officials and supposedly based upon our most secure intelligence sources. Perhaps a few intrepid citizen-activists managed to replicate the findings of our multi-billion-dollar intelligence apparatus, and did so in days while the latter required weeks or months. But a more likely scenario is that the wave of January speculation was driven by private leaks and "guidance" provided by exactly the same elements that today are very publicly leveling similar charges in the elite media. Initially promoting controversial theories in less mainstream outlets has long been a fairly standard intelligence practice.

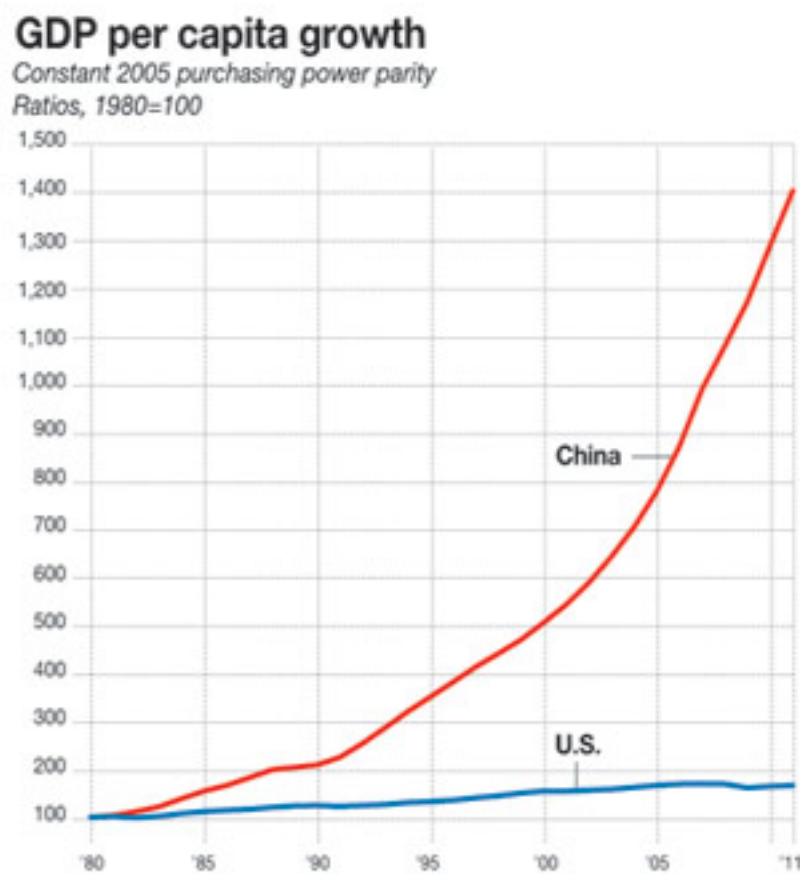
Regardless of the origins of the idea, does it seem plausible that the coronavirus outbreak might have originated as an accidental leak from that Chinese laboratory? I am not privy to the security procedures of Chinese government facilities, but applying a little common sense may shed some light on that question.

Although the coronavirus is only moderately lethal, apparently having a fatality rate of 1% or less, it is extremely contagious, including during an extended pre-symptomatic period and also among asymptomatic carriers. Thus, portions of the US and Europe are now suffering heavy casualties, while the policies adopted to control the spread have devastated their national economies. Although the virus is unlikely to kill more than a small sliver of our population, we have seen to our dismay how a major outbreak can so easily wreck our entire economic life.

During January, the journalists reporting on China's mushrooming health crisis regularly emphasized that the mysterious new viral outbreak had occurred at the worst possible place and time, appearing in the major transport hub of Wuhan just prior to the Lunar New Year

holiday, when hundreds of millions of Chinese would normally travel to their distant family homes for the celebration, thereby potentially spreading the disease to all parts of the country and producing a permanent, uncontrollable epidemic. The Chinese government avoided that grim fate by the unprecedented decision to shut down its entire national economy and confine 700 million Chinese to their own homes for many weeks. But the outcome seems to have been a very near thing, and if Wuhan had remained open for just a few days longer, China might easily have suffered long-term economic and social devastation.

The timing of an accidental laboratory release would obviously be entirely random. Yet the outbreak seems to have begun during the precise period of time most likely to damage China, the worst possible ten-day or perhaps thirty-day window. As I noted in January, I saw no solid evidence that the coronavirus was a bioweapon, but if it were, the timing of the release seemed very unlikely to have been accidental.



If the virus had been released intentionally, the context and motive for such a biowarfare attack against China could not be more obvious. Although our disingenuous media continues to pretend otherwise, the size of China's economy surpassed that of our own several years ago, and has continued to grow much more rapidly. Chinese companies have also taken the lead in several crucial technologies, with Huawei becoming the world's leading telecommunications equipment manufacturer and dominating the important 5G market. China's sweeping Belt and Road Initiative has threatened to reorient global trade around an interconnected Eurasian landmass, greatly diminishing the leverage of America's own control over the seas. I have closely followed China for over forty years, and the trend-lines have never been more apparent. Back in 2012, I published an article bearing the provocative title "China's Rise, America's Fall?" and since then I have seen no reason to reassess my verdict.

- China's Rise, America's Fall
  *Which superpower is more threatened by its extractive elites?*
  Ron Unz • *The American Conservative,* April 17, 2012 • 7,000 Words

For three generations following the end of World War II, America had stood as the world's supreme economic and technological power, while the collapse of the Soviet Union thirty years ago left us as the sole remaining superpower, facing no conceivable military rival. A growing sense that we were rapidly losing that unchallenged position had certainly inspired the anti-China rhetoric of many senior figures in the Trump Administration, who launched a major trade war soon after coming into office. The increasing misery and impoverishment of large sections of the American population naturally left these voters searching for a convenient scapegoat, and the prosperous, rising Chinese made a perfect target.

Despite America's growing economic conflict with China over the last couple of years, I had never considered the possibility that matters might take a military turn. The Chinese had long ago deployed advanced intermediate range missiles that many believed could easily sink our carriers in the region, and they had also generally improved their conventional military deterrent. Moreover, China was on quite good terms with Russia, which itself had been the target of intense American hostility for several years; and Russia's new suite of revolutionary hypersonic missiles had drastically reduced any American strategic advantage. Thus, a conventional war against

China seemed an absolutely hopeless undertaking, while China's outstanding businessmen and engineers were steadily gaining ground against America's decaying and heavily-financialized economic system.

Under these difficult circumstances, an American biowarfare attack against China might have seemed the only remaining card to play in hopes of maintaining American supremacy. Plausible deniability would minimize the risk of any direct Chinese retaliation, and if successful, the terrible blow inflicted to China's economy would set it back for many years, perhaps even destabilizing its social and political system. Using alternative media to immediately promote theories that the coronavirus outbreak was the result of a leak from a Chinese biowarfare lab was a natural means of preempting any later Chinese accusations along similar lines, thereby allowing America to win the international propaganda war before China had even begun to fight.

A decision by elements of our national security establishment to wage biological warfare in hopes of maintaining American world power would certainly have been an extremely reckless act, but extreme recklessness has become a regular aspect of American behavior since 2001, especially under the Trump Administration. Just a year earlier we had kidnapped the daughter of Huawei's founder and chairman, who also served as CFO and ranked as one of China's most top executives, while at the beginning of January we suddenly assassinated Iran's top military leader.

These were the thoughts that entered my mind during the last week of January once I discovered the widely circulating theories suggesting that China's massive disease epidemic had been the self-inflicted consequence of its own biowarfare research. I saw no solid evidence that the coronavirus was a bioweapon, but if it were, China was surely the innocent victim of the attack, presumably carried out by elements of the American national security establishment.

Soon afterward, someone brought to my attention a very long article by an American ex-pat living in China who called himself "Metallicman" and held a wide range of eccentric and implausible beliefs. I have long recognized that flawed individuals can often serve as the vessels of important information otherwise unavailable, and this case constituted a perfect example. His piece denounced the outbreak as a likely American biowarfare attack, and provided a great wealth of factual material I had not previously considered. Since he authorized

republication elsewhere I did so, and his 15,000 word analysis, although somewhat raw and unpolished, began attracting an enormous amount of readership on our website, probably being one of the very first English-language pieces to suggest that the mysterious new disease was an American bioweapon. Many of his arguments appeared doubtful to me or have been obviated by later developments, but several seemed quite telling.

He pointed out that during the previous two years, the Chinese economy had already suffered serious blows from other mysterious new diseases, although these had targeted farm animals rather than people. During 2018 a new Avian Flu virus had swept the country, eliminating large portions of China's poultry industry, and during 2019 the Swine Flu viral epidemic had devastated China's pig farms, destroying 40% of the nation's primary domestic source of meat, with widespread claims that the latter disease was being spread by mysterious small drones. My morning newspapers had hardly ignored these important business stories, noting that the sudden collapse of much of China's domestic food production might prove a huge boon to American farm exports at the height of our trade conflict, but I had never considered the obvious implications. So for three years in a row, China had been severely impacted by strange new viral diseases, though only the most recent had been deadly to humans. This evidence was merely circumstantial, but the pattern seemed highly suspicious.

The writer also noted that shortly before the coronavirus outbreak in Wuhan, that city had hosted 300 visiting American military officers, who came to participate in the 2019 Military World Games, an absolutely remarkable coincidence of timing. As I pointed out at the time, how would Americans react if 300 Chinese military officers had paid an extended visit to Chicago, and soon afterward a mysterious and deadly epidemic had suddenly broken out in that city? Once again, the evidence was merely circumstantial but certainly raised dark suspicions.

Scientific investigation of the coronavirus had already pointed to its origins in a bat virus, leading to widespread media speculation that bats sold as food in the Wuhan open markets had been the original disease vector. Meanwhile, the orchestrated waves of anti-China accusations had emphasized Chinese laboratory research on that same viral source. But we soon published a lengthy article by investigative journalist Whitney Webb providing copious evidence of America's own enormous biowarfare research efforts, which had similarly focused for years on bat viruses. Webb was then associated with

*MintPress News*, but that publication had strangely declined to publish her important piece, perhaps skittish about the grave suspicions it directed towards the US government on so momentous an issue. So without the benefit of our platform, her major contribution to the public debate might have attracted relatively little readership.

Around the same time, I noted another extremely strange coincidence that failed to attract any interest from our somnolent national media. Although his name had meant nothing to me, in late January my morning newspapers carried major stories on the sudden arrest of Prof. Charles Lieber, one of Harvard University's top scientists and Chairman of its Chemistry Department, sometimes characterized as a potential future Nobel Laureate.

The circumstances of that case seemed utterly bizarre to me. Like numerous other prominent American academics, Lieber had had decades of close research ties with China, holding joint appointments and receiving substantial funding for his work. But now he was accused of financial reporting violations in the disclosure portions of his government grant applications—the most obscure sort of offense—and on the basis of those accusations, he was seized by the FBI in an early-morning raid on his suburban Lexington home and dragged off in shackles, potentially facing years of federal imprisonment.

Such government action against an academic seemed almost without precedent. During the height of the Cold War, numerous American scientists and technicians were rightfully accused of having stolen our nuclear weapons secrets for delivery to Stalin, yet I had never heard of any of them treated in so harsh a manner, let alone a scholar of Prof. Lieber's stature, who was merely charged with technical disclosure violations. Indeed, this incident recalled accounts of NKVD raids during the Soviet purges of the 1930s.

Although Lieber was described as a chemistry professor, a few seconds of Googling revealed that some of his most important work had been in virology, including technology for the detection of viruses. So a massive and deadly new viral epidemic had broken out in China and almost simultaneously, a top American scholar with close Chinese ties and expertise in viruses was suddenly arrested by the federal government, yet no one in the media expressed any curiosity at a possible connection between these two events.

I think we can safely assume that Lieber's arrest by the FBI had been

prompted by the concurrent coronavirus epidemic, but anything more is mere speculation. Those now accusing China of having created the coronavirus might surely suggest that our intelligence agencies discovered that the Harvard professor had been personally involved with that deadly research. But I think a far more likely possibility is that Lieber began to wonder whether the epidemic in China might not be the result of an American biowarfare attack, and was perhaps a little too free in voicing his suspicions, thereby drawing the wrath of our national security establishment. Inflicting such extremely harsh treatment upon a top Harvard scientist would greatly intimidate all of his lesser colleagues elsewhere, who would surely now think twice before broaching certain controversial theories to any journalist.

By the end of January, our webzine had published a dozen articles and posts on the coronavirus outbreak, then added many more by the middle of February. These pieces totaled tens of thousands of words and attracted a half million words of comments, probably representing the primary English-language source for a particular perspective on the deadly epidemic, with this material eventually drawing many hundreds of thousands of pageviews. A few weeks later, the Chinese government began gingerly raising the possibility that the coronavirus may have been brought to Wuhan by the 300 American military officers visiting that city, and was fiercely attacked by the Trump Administration for spreading anti-American propaganda. But I strongly suspect that the Chinese had gotten that idea from our own publication.

As the coronavirus gradually began to spread beyond China's own borders, another development occurred that greatly multiplied my suspicions. Most of these early cases had occurred exactly where one might expect, among the East Asian countries bordering China. But by late February Iran had become the second epicenter of the global outbreak. Even more surprisingly, its political elites had been especially hard-hit, with a full 10% of the entire Iranian parliament soon infected and at least a dozen of its officials and politicians dying of the disease, including some who were quite senior. Indeed, Neocon activists on Twitter began gleefully noting that their hatred Iranian enemies were now dropping like flies.

Let us consider the implications of these facts. Across the entire world the only political elites that have yet suffered any significant human losses have been those of Iran, and they died at a very early stage, before significant outbreaks had even occurred almost anywhere else

in the world outside China. Thus, we have America assassinating Iran's top military commander on Jan. 2nd and then just a few weeks later large portions of the Iranian ruling elites became infected by a mysterious and deadly new virus, with many of them soon dying as a consequence. Could any rational individual possibly regard this as a mere coincidence?

Biological warfare is a highly technical subject, and those possessing such expertise are unlikely to candidly report their classified research activities in the pages of our major newspapers, perhaps even less so after Prof. Lieber was dragged off to prison in chains. My own knowledge is nil. But in mid-March I came across several extremely long and detailed comments on the coronavirus outbreak that had been posted on a small website by an individual calling himself "OldMicrobiologist" and who claimed to be a retired forty-year veteran of American biodefense. The style and details of his material struck me as quite credible, and after a little further investigation I concluded that there was a high likelihood his background was exactly as he had described. I made arrangements to republish his comments in the form of a 3,400 word article, which soon attracted a great deal of traffic and 80,000 words of further comments.

Although the writer emphasized the lack of any hard evidence, he said that his experience led him to strongly suspect that the coronavirus outbreak was indeed an American biowarfare attack against China, probably carried out by agents brought into that country under cover of the Military Games held at Wuhan in late October, the sort of sabotage operation our intelligence agencies had sometimes undertaken elsewhere. One important point he made was that high lethality was often counter-productive in a bioweapon since debilitating or hospitalizing large numbers of individuals may impose far greater economic costs on a country than a biological agent which simply inflicts an equal number of deaths. In his words "a high communicability, low lethality disease is perfect for ruining an economy," suggesting that the apparent characteristics of the coronavirus were close to optimal in this regard. Those so interested should read his analysis and assess for themselves his credibility and persuasiveness.

- Was Coronavirus a Biowarfare Attack Against China?
  OldMicrobiologist • March 13, 2020 • 3,400 Words

One intriguing aspect of the situation was that almost from the first moment that reports of the strange new epidemic in China reached the international media, a large and orchestrated campaign had been

launched on numerous websites and Social Media platforms to identify the cause as a Chinese bioweapon carelessly released in its own country. Meanwhile, the far more plausible hypothesis that China was the victim rather than the perpetrator had received virtually no organized support anywhere, and only began to take shape as I gradually located and republished relevant material, usually drawn from very obscure quarters and often anonymously authored. So it seemed that only the side hostile to China was waging an active information war. The outbreak of the disease and the nearly simultaneous launch of such a major propaganda campaign may not necessarily prove that an actual biowarfare attack had occurred, but I do think it tends to support such a theory.

When considering the hypothesis of an American biowarfare attack, certain natural objections come to mind. The major drawback to biological warfare has always been the obvious fact that the self-replicating agents employed will not respect national borders, thus raising the serious risk that the disease might eventually return to the land of its origin and inflict substantial casualties. For this reason, it seems very doubtful that any rational and half-competent American leadership would have unleashed the coronavirus against China.

But as we see absolutely demonstrated in our daily news headlines, America's current government is grotesquely and manifestly *incompetent*, more incompetent than one could almost possibly imagine, with tens of thousands of Americans having now already paid with their lives for such extreme incompetence. Rationality and competence are obviously nowhere to be found among the Deep State Neocons that President Donald Trump has appointed to so many crucial positions throughout our national security apparatus.

Moreover, the extremely lackadaisical notion that a massive coronavirus outbreak in China would never spread back to America might have seemed plausible to individuals who carelessly assumed that past historical analogies would continue to apply. As I wrote a few weeks ago:

> Reasonable people have suggested that if the coronavirus was a bioweapon deployed by elements of the American national security apparatus against China (and Iran), it's difficult to imagine why the they didn't assume it would naturally leak back in the US and start a huge pandemic here, as is currently happening.

> The most obvious answer is that they were stupid and incompetent, but here's another point to consider…
>
> In late 2002 there was the outbreak of SARS in China, a related virus but that was far more deadly and somewhat different in other characteristics. The virus killed hundreds of Chinese and spread into a few other countries before it was controlled and stamped out. The impact on the US and Europe was negligible, with just a small scattering of cases and only a death or two.
>
> So if American biowarfare analysts were considering a coronavirus attack against China, isn't it quite possible they would have said to themselves that since SARS never significantly leaked back into the US or Europe, we'd similarly remain insulated from the coronavirus? Obviously, such an analysis was foolish and mistaken, but would it have seemed so implausible at the time?

As some must have surely noticed, I have deliberately avoided investigating any of the scientific details of the coronavirus. In principle, an objective and accurate analysis of the characteristics and structure of the virus might help suggest whether it was entirely natural or rather the product of a research laboratory, and in the latter case, perhaps whether the likely source was China, America, or some third country.

But we are dealing with a cataclysmic world event and those questions obviously have enormous political ramifications, so the entire subject is shrouded by a thick fog of complex propaganda, with numerous conflicting claims being advanced by interested parties. I have no background in microbiology let alone biological warfare, so I would be hopelessly adrift in evaluating such conflicting scientific and technical claims. I suspect that this is equally true of the overwhelming majority of other observers as well, although committed partisans are loathe to admit that fact, and will eagerly seize upon any scientific argument that supports their preferred position while rejecting those that contradict it.

Therefore, by necessity, my own focus is on evidence that can at least be understood by every layman, if not necessarily always accepted. And I believe that the simple juxtaposition of several recent disclosures in the mainstream media leads to a rather telling conclusion.

For obvious reasons, the Trump Administration has become very eager to emphasize the early missteps and delays in the Chinese reaction to the viral outbreak in Wuhan, and has presumably encouraged our media outlets to direct their focus in that direction.

As an example of this, the Associated Press Investigative Unit recently published a rather detailed analysis of those early events purportedly based upon confidential Chinese documents. Provocatively entitled "China Didn't Warn Public of Likely Pandemic for 6 Key Days", the piece was widely distributed, running in abridged form in the *NYT* and elsewhere. According to this reconstruction, the Chinese government first became aware of the seriousness of this public health crisis on Jan. 14th, but delayed taking any major action until Jan. 20th, a period of time during which the number of infections greatly multiplied.

Last month, a team of five *WSJ* reporters produced a very detailed and thorough 4,400 word analysis of the same period, and the *NYT* has published a helpful timeline of those early events as well. Although there may be some differences of emphasis or minor disagreements, all these American media sources agree that Chinese officials first became aware of the serious viral outbreak in Wuhan in early to mid-January, with the first known death occurring on Jan. 11th, and finally implemented major new public health measures later that same month. No one has apparently disputed these basic facts.

But with the horrific consequences of our own later governmental inaction being obvious, elements within our intelligence agencies have sought to demonstrate that they were not the ones asleep at the switch. Earlier this month, an *ABC News* story cited four separate government sources to reveal that as far back as late November, a special medical intelligence unit within our Defense Intelligence Agency had produced a report warning that an out-of-control disease epidemic was occurring in the Wuhan area of China, and widely distributed that document throughout the top ranks of our government, warning that steps should be taken to protect US forces based in Asia. After the story aired, a Pentagon spokesman officially denied the existence of that November report, while various other top level government and intelligence officials refused to comment. But a few days later, Israeli television mentioned that in November American intelligence had indeed shared such a report on the Wuhan disease outbreak with its NATO and Israeli allies, thus seeming to independently confirm the complete accuracy of the original *ABC News* story and its several government sources.

***It therefore appears that elements of the Defense Intelligence Agency were aware of the deadly viral outbreak in Wuhan more than a month before any officials in the Chinese government itself.*** Unless our intelligence agencies have pioneered the technology of precognition, I think this may have happened for the same reason that arsonists have the earliest knowledge of future fires.

Back in February, before a single American had died from the disease, I wrote my own overview of the possible course of events, and I would still stand by it today:

> Consider a particularly ironic outcome of this situation, not particularly likely but certainly possible…
>
> Everyone knows that America's ruling elites are criminal, crazy, and also extremely incompetent.
>
> So perhaps the coronavirus outbreak was indeed a deliberate biowarfare attack against China, hitting that nation just before Lunar New Year, the worst possible time to produce a permanent nationwide pandemic. However, the PRC responded with remarkable speed and efficiency, implementing by far the largest quarantine in human history, and the deadly disease now seems to be in decline there.
>
> Meanwhile, the disease naturally leaks back into the US, and despite all the advance warning, our totally incompetent government mismanages the situation, producing a huge national health disaster, and the collapse of our economy and decrepit political system.
>
> As I said, not particularly likely, but certainly a very fitting end to the American Empire…

# Google and the John McCain Cover-up

***The Unz Review*** • August 6, 2020 • 1,800 Words

Back in early May Google took the remarkable step of deranking our entire website, placing our many thousands of content pages near the absolute bottom of its search results, where almost no one would ever see them. If a user included the keyword "unz" in a search string, our pages would still come up, but otherwise they would be almost totally invisible. So people specifically looking for our website could still find it, but almost no one else.

Google holds a worldwide monopoly in search, having a total market share greater than 90% and therefore functioning as a global gatekeeper to the Internet, so this harsh action had serious consequences. Our regular daily traffic dropped by 15% or more, especially reducing the inflow of casual new visitors who might discover our alternative media webzine in an unrelated search. The national wave of urban turmoil that broke out at the end of that same month soon overwhelmed this decline and lifted our traffic to new heights, but the severe loss of new readers remained. So although our daily pageviews have set new records, the number of unique visitors to our website has remained substantially diminished.

Then a couple of weeks ago, various journalists reported an even more severe manipulation of Google's search system, with dozens of top Republican-leaning websites, including Breitbart and Drudge, suddenly discovering that all their content had entirely disappeared from Google while liberal-leaning publications remained unaffected. This search engine "glitch" ended within a day and the conservative websites reappeared, but there was widespread speculation that Google had added a "kill switch" that could cleanse the Internet of all right-wing content at a moment's notice, and someone had inadvertently tested this powerful new media weapon in public, thereby revealing its existence.

A presidential election is less than three months away, and conservatives have long complained that the Silicon Valley tech giants are biased against them. So the very real possibility that Google was road-testing the ability to "disappear" all conservative publications at some crucial moment must surely have raised concerns even among the most level-headed.

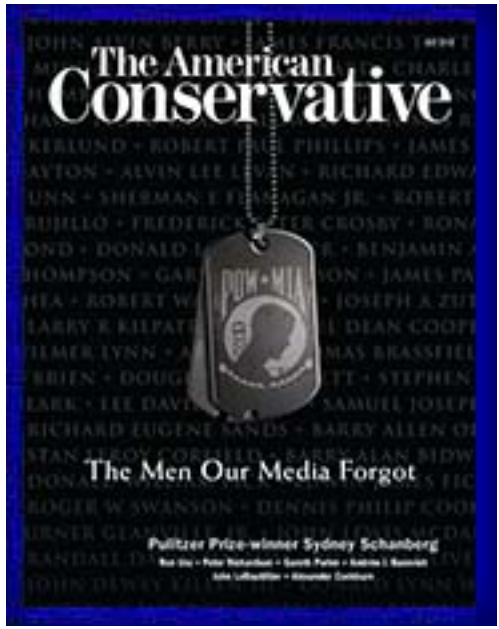
Therefore, I naturally assumed that this crucial issue of biased search results would become a central point of questioning during last week's Congressional testimony of Google CEO Sundar Pichai. Surely the Republican members of the committee would ask him why all the websites in their ideological camp had suddenly disappeared from Google, and whether this suggested deliberate plans by the Monopolist of Mountain View to slant its search results against their side of the aisle. Google displays the results of *six billion searches* each day, so such bias would probably have a political impact millions of times greater than the alleged "RussiaGate manipulation" that had so dominated our national headlines for many months.

However, I was sorely mistaken. Neither the national newspapers nor other publications reported any such line of questioning. This suggested that the Republican members of the committee were either reluctant to antagonize their powerful witness, or more likely, were just too ignorant of the Internet to realize that if Google suddenly "disappeared" all their media outlets, many of their voters and their own seats in Congress would soon follow. So I was forced to listen to the entire three and a half hour hearing on YouTube, then afterward hunted around in vain for a complete transcript.

Although the Republicans made little attempt to pin down Google's

chief, some of Pichai's responses certainly seemed to suggest that Google was committed to providing unbiased search results, especially during his questioning by Rep. Steve King (R-IA). He assured his listeners that Google never "put its thumb on the scale" of search results, nor allowed "manual intervention" to corrupt its objective algorithms. Any casual listener would surely assume that Google search results were ranked solely by the number and quality of their links and sources rather than modified for reasons of ideological bias or political expediency. Yet it is quite easy to demonstrate the contrary. I recounted last year:

> As the winner of the Pulitzer Prize and two George Polk awards, the late Sydney Schanberg was widely regarded as one of the greatest American war correspondents of the twentieth century. His exploits during our ill-fated Indo-Chinese War had become the basis of the Oscar-winning film *The Killing Fields*, which probably established him as the most famous journalist in America after Woodward and Bernstein of Watergate fame, and he had also served as a top editor at *The New York Times*. A decade ago, he published his greatest expose, providing a mountain of evidence that America had deliberately left behind hundreds of POWs in Vietnam and he fingered then-presidential candidate John McCain as the central figure in the later official cover-up of that monstrous betrayal. The Arizona senator had traded on his national reputation as our best-known former POW to bury the story of those abandoned prisoners, permitting America's political establishment to escape serious embarrassment. As a result, Sen. McCain earned the lush rewards of our generous ruling elites, much like his own father Admiral John S. McCain, Sr., who had led the cover-up of the deliberate 1967 Israeli attack on the U.S.S. Liberty, which killed or wounded over 200 American servicemen.



As publisher of *The American Conservative*, I ran Schanberg's remarkable piece as a cover story, and across several websites over the years it has surely been read many hundreds of thousands of times, including a huge spike around the time of McCain's death. I therefore find it rather difficult to believe that the many journalists investigating McCain's background might have remained unaware of this material. Yet no hints of these facts were provided in any of the articles appearing in any remotely prominent media outlets as can be seen by searching for web pages containing "McCain and Schanberg" dated around the time of the Senator's passing.

Schanberg's journalistic stature had hardly been forgotten by his former colleagues. Upon his death a couple of years ago, the *Times* ran a very long and glowing obituary, and a few months later I attended the memorial tribute to his life and career held at the *New York Times* headquarters building, which included more than two hundred prominent journalists mostly from his own generation, including those of the highest rank. *Times* Publisher Arthur Sulzberger, Jr. gave a speech describing how as a young man he had always so greatly admired Schanberg and had been mortified by the unfortunate circumstances of his departure from the family's newspaper. Former Executive Editor Joseph Lelyveld recounted the many years he had worked closely with the man he had long considered his closest friend and colleague, someone whom he almost seemed to regard as his older brother. But

during the two hours of praise and remembrance scarcely a single word was uttered in public about the gigantic story that had occupied the last two decades of Schanberg's celebrated career.

- John McCain and the POW Cover-Up
  Sydney Schanberg ◆ May 25, 2010 ◆ 8,200 Words

Although Google controls all but a slice of the worldwide search engine market, very similar technologies are employed by its various competitors such as Bing, DuckDuckGo, and Russia's Yandex, and it is easy to compare their strikingly dissimilar results for the simple string "mccain pows":

- https://www.google.com/search?q=mccain+pows
- https://www.bing.com/search?q=mccain+pows
- https://duckduckgo.com/?q=mccain+pows
- https://yandex.com/search/?text=mccain+pows

For Bing, Schanberg's *American Conservative* cover-story ranks #1. For DuckDuckGo, it ranks #2, just below McCain's Wikipedia entry. For Yandex, the republication on *The Unz Review* holds the top spot, with the *American Conservative* version placing #2. But Schanberg's remarkable 8,200 word expose has been "disappeared" from Google's search engine, nowhere to be found across at least the first ten pages of results.

These striking differences seem totally inconsistent with Pichai's sworn Congressional testimony that Google never uses "manual intervention" to place "its thumb on the scale" of the search results used each day by so many hundreds of millions of individuals.

I have previously expressed by great irritation that Google had "disappeared" my own articles, but suffering the same fate as one of the foremost American journalists of the twentieth century does cushion the blow:

> For the last ten years, my article The Myth of Hispanic Crime had regularly ranked #2 among the 180 million search results Google returned for "Latino Crime" and the 60 million for "Hispanic Crime," an achievement for which I had become inordinately proud. But although comparable search engines such as Bing and DuckDuckGo still rank my piece near the very top, Google has completely "disappeared" it.
>
> I think a reasonable measure of a topic's importance is the total number of search results it returns. Communism and Communists

dominated the entire twentieth century and the political party of that name still holds sway in gigantic China. So a search on "Communism" returns 163 million results, a vast number but still somewhat below the total for "Latino Crime." Imagine how an academic or journalist might feel if his article analyzing Communism had spent a full decade ranked #2 across the entire Internet, but Google had then suddenly decided to blacklist it for reasons entirely unrelated to its intrinsic or objective quality.

- https://www.google.com/search?q=latino+crime
- https://www.bing.com/search?q=latino+crime
- https://duckduckgo.com/?q=latino+crime
- https://yandex.com/search/?text=latino+crime

- https://www.google.com/search?q=hispanic+crime
- https://www.bing.com/search?q=hispanic+crime
- https://duckduckgo.com/?q=hispanic+crime
- https://yandex.com/search/?text=hispanic+crime

My American Pravda series has also vanished from Google, while still ranking at or near the top of all its competitors.

- https://www.google.com/search?q=american+pravda
- https://www.bing.com/search?q=american+pravda
- https://duckduckgo.com/?q=american+pravda
- https://yandex.com/search/?text=american+pravda

Naturally, my far harsher critiques of John McCain's long career have entirely vanished as well:

- John McCain: When "Tokyo Rose" Ran for President
  Ron Unz • March 9, 2015 • 4,200 Words

- American Pravda: John McCain, Jeffrey Epstein, and Pizzagate
  *Our Reigning Political Puppets, Dancing to Invisible Strings*
  Ron Unz • July 29, 2019 • 6,400 Words

Google is obviously a private corporation, holding an unregulated monopoly over our sources of Internet information, and I cannot say whether or not its manipulation of search results for political reasons violates American law.

But lying under oath to members of Congress during sworn public testimony is a serious felony, and I think Mr. Pichai would be well-

advised to immediately investigate whether his own subordinates have been misleading him on important aspects of his own company's search operations.

# 31,000 Words Missing from *The Atlantic* and *The New York Times Sunday Magazine*

***The Unz Review*** • September 9, 2020 • 2,900 Words

For many years I had predicted to my friends that the increasingly bizarre and incompetent behavior of America's ruling elites might soon result in a major "negative discontinuity" for our unfortunate country, the sort of massive event that future authors would use to divide one section of a thick history textbook from the next.

I couldn't quite say what form that "discontinuity" might take, but I suggested possibilities along the lines of another Great Depression or some huge social upheaval or perhaps even a world war. The notion of an uncontrolled disease epidemic never crossed my mind, but our Covid-19 outbreak—together with the totally incompetent governmental response and the resulting social and economic disaster—seems to fit the bill quite nicely, even producing a triple-header of national calamities.

Or perhaps a quadruple-header. Although a world war still seems distant, the recent demonization of China, a bipartisan project of Democrats and Republicans alike, has already been labeled a new Cold War by leading journalistic observers, and cold wars can easily turn hot. Just a couple of weeks ago, American provocations in the vicinity of Chinese military exercises led the Chinese to respond by test-firing several of their vaunted "carrier-killer" missiles, weapons widely believed capable of immediately sending any of our primary power-projection platforms to the bottom of the ocean.

For three generations, the US has carefully avoided any military conflict with a near-peer, but that traditional forbearance may now have been replaced by extreme recklessness. Many of our cities have been set aflame in urban rioting, we have seen a huge spike in violent crime, and massive unemployment continues. So if the incumbent's poll numbers look bleak as Election Day nears, a political October Surprise of major sabre-rattling and brinksmanship seems quite possible, and a sudden misstep might then put us at war in the South China Sea.

Chinese anti-carrier ballistic missiles have been developed to prevent

an American blockade of their vital offshore waters, and many analysts doubt we have any effective defense. The loss of a carrier would mean thousands of American deaths and the possible collapse of our perceived control of the world's sea lanes, perhaps ending the dollar's long reign as the world's reserve currency and thereby massively impoverishing our citizenry. A frantic American government might react by escalating to nuclear weapons, with horrific and unforeseeable consequences.

Greatly increasing this risk of war has been the very dangerous public game played for months by the Trump Administration and its political allies. The response of America's national government to the Covid-19 outbreak was among the worst and most incompetent in the world, with only India and Brazil challenging our place at the bottom of the charts, and it is difficult to imagine a worse political nightmare for an incumbent during a presidential election year. The widespread national lockdowns produced an unprecedented spike in business failures and unemployment, which have only temporarily been mitigated by raising our national debt to levels last seen at the close of the Second World War.

Under such difficult circumstances, even the most sober and cautious of political leaders would naturally seek some desperate means of diverting blame elsewhere, and no one has ever accused our current president of such sobriety. So it was hardly surprising that for weeks during the peak of the New York outbreak and the early national lockdowns, Trump and his top officials explicitly suggested that the deadly virus had come from a Wuhan lab, thus accusing the Chinese government of being responsible for our deaths and economic disaster, with such charges being widely echoed in the media.

Although that public war of words has now subsided, the impact still remains. According to a poll taken at the end of April, a remarkable 45% of Americans believed that the deadly virus had "probably" or "definitely" originated in such a laboratory, with 74% of Republicans having that belief. Consider that nearly 200,000 Americans have already died and our business economy has suffered trillions of dollars in losses. Most great wars have been launched on merely a sliver of such justification.

This is an exceptionally dangerous situation, and we would naturally expect that our leading national publications would devote enormous resources to carefully investigating such dramatic charges and perhaps refuting them, especially given that their editorial staffs so greatly loathe the current occupant of the White House.

It sometimes seems like every edition of my morning *New York Times* includes one or more headlines screaming the phrase "Trump lied", generally with reference to some casually insulting Tweet about a leading Democrat. But the Great Satan's public accusation that the Chinese government has been directly responsible for the deaths of nearly 200,000 American deaths seems to have received far less scrutiny. Both the *Wall Street Journal* and the *Times* have published investigative reports on some of these issues, but these have been extremely deferential in their coverage, and anyway lacked the depth and detail that is so clearly warranted.

A natural venue for serious investigative journalism would be the prestigious national magazines that have traditionally provided long-form reporting, with *The Atlantic* and *The New York Times Sunday Magazine* being the most obvious possibilities. But these publications have increasingly shifted their focus to "wokeness" and seem to believe that the investigative research necessary to help deflect a world war with China has far less importance than a soulful piece on the emotional plight of transgendered black rappers.

Fortunately, the ease of Internet publishing has allowed the creation of a multitude of new webzine outlets, able to fill the gaps created by the increased frivolity and irrelevance of their established predecessors. The emerging landscape of alternative media is a broad one, with individual publications possessing different strengths and weaknesses. For example, our own webzine has very high traffic but is among the most controversial and therefore one of the least likely to be mentioned in mainstream outlets.

Situated at the opposite end of this spectrum is *Quillette*. Launched in 2015 by former mainstream journalist Claire Lehmann, this webzine is sufficiently respectable that few journalists or academics would fear any association. Establishing such respectability is merely a means toward an end, and *Quillette* has now justified that effort many times over by publishing a remarkable four-part series analyzing the wider Covid-19 accusations against China. The author, Philippe Lemoine is a Cornell graduate student originally from France and his exhaustive 31,000 word opus might once have appeared as the cover-story of one of our leading national publications prior to their lapse into decadence. I have seen nothing else so comprehensive on that subject, and I would strongly recommend that the articles be read by everyone interested in this important topic.

- The China Syndrome Part I: Outbreak
- The China Syndrome Part II: Transmission and Response

- The China Syndrome Part III: Wet Markets and BioLabs
- The China Syndrome Part IV: Did China Fudge its Data?

Attempting to summarize over 30,000 words in just a couple of paragraphs is a hopeless undertaking that I will not attempt. But the author seems to follow proper scholarly methods, carefully evaluating the often conflicting sources and applying a good deal of logic and common sense. In some cases he draws clear conclusions, but more often he properly settles for reasonable likelihoods rather than anything stronger.

In reading this analysis I was repeatedly struck by the extremely flimsy nature of the evidence being used to indict China. One of the most widely cited theories implicating the Wuhan lab was apparently based upon nothing more than unsubstantiated social media rumors, while a major article in *National Review* doctored its central quotes by leaving out sentences that completely changed their meaning. In recent years our media has fiercely ridiculed those lunatic conspiracy-mongers who claim that most of our mass-shootings have been media hoaxes perpetrated by "crisis actors" or that "nobody died at Sandy Hook." But much of the main evidence pointing to Chinese culpability for the worldwide Covid-19 disaster appears just as vacuous.

Lemoine seems a very cautious writer and he carefully avoids contaminating his important analysis by suggesting any bad faith or fraud in the work he is examining, but given the history of the last couple of decades we can hardly ignore that possibility. Our disastrous Iraq War was promoted by the knowingly-false claims of Saddam's WMDs, and the equally farcical Russiagate Hoax has roiled American politics for more than three years. Governmental intelligence agencies have great resources and expertise in fabricating evidence and then effectively promoting their concoctions through their network of friendly journalists. We should hardly be surprised if such means had been employed to redirect the political blame for a multi-trillion-dollar global catastrophe.

Lemoine handles even more delicate matters extremely well. The *WSJ* had already established that the national health authorities in China only learned of the growing Wuhan disease outbreak at the very end of December, and he persuasively argues that their local counterparts in that city had only become aware a few days earlier. But in Part I of his series, he also includes a discordant early paragraph mentioning that multiple US Intelligence sources had disclosed to *ABC News* that

in late November a unit of our own Defense Intelligence Agency had distributed a secret report describing a "cataclysmic" disease outbreak taking place in Wuhan, warning our military forces stationed in East Asia to take appropriate health precautions. Lemoine correctly notes that the claims "made no sense" since "there is simply no way US intelligence could have known that an epidemic was underway at the time." Therefore, he concludes that the report never existed and that the leaks were false information provided by enemies of Donald Trump in an effort to embarrass the president.

But as an extremely diligent researcher he surely must be aware that Israeli TV had independently confirmed the existence of that secret DIA report, disclosing that it had been widely distributed both to their own government and to our NATO allies. However, if Lemoine had acknowledged the reality that our intelligence agencies were fully aware of the Wuhan outbreak more than a month before anyone in China, the obvious implications would be too explosive to avoid considering. And any such discussion would have ensured that his very important 31,000 word series never appeared in any respectable venue. But by including that crucial paragraph, he may at least have begun to raise questions in the minds of his establishmentarian readers.

An effective media strategy may often require a division of labor, with different horses for different courses. Given that my own writings and webzine lack the "mainstream respectability" of *Quillette*, I can be much more candid in my analyses, and will once again repeat a few of the crucial paragraphs I had first published back in April:

> But with the horrific consequences of our own later governmental inaction being obvious, elements within our intelligence agencies have sought to demonstrate that they were not the ones asleep at the switch. Earlier this month, an *ABC News* story cited four separate government sources to reveal that as far back as late November, a special medical intelligence unit within our Defense Intelligence Agency had produced a report warning that an out-of-control disease epidemic was occurring in the Wuhan area of China, and widely distributed that document throughout the top ranks of our government, warning that steps should be taken to protect US forces based in Asia. After the story aired, a Pentagon spokesman officially denied the existence of that November report, while various other top level government and intelligence officials refused to comment. But a few days later, Israeli television mentioned that in November American intelligence had indeed shared such a report on the Wuhan disease outbreak with

its NATO and Israeli allies, thus seeming to independently confirm the complete accuracy of the original ABC News story and its several government sources.

***It therefore appears that elements of the Defense Intelligence Agency were aware of the deadly viral outbreak in Wuhan more than a month before any officials in the Chinese government itself.*** Unless our intelligence agencies have pioneered the technology of precognition, I think this may have happened for the same reason that arsonists have the earliest knowledge of future fires.

As the coronavirus gradually began to spread beyond China's own borders, another development occurred that greatly multiplied my suspicions. Most of these early cases had occurred exactly where one might expect, among the East Asian countries bordering China. But by late February Iran had become the second epicenter of the global outbreak. Even more surprisingly, its political elites had been especially hard-hit, with a full 10% of the entire Iranian parliament soon infected and at least a dozen of its officials and politicians dying of the disease, including some who were quite senior. Indeed, Neocon activists on Twitter began gleefully noting that their hatred Iranian enemies were now dropping like flies.

Let us consider the implications of these facts. Across the entire world the only political elites that have yet suffered any significant human losses have been those of Iran, and they died at a very early stage, before significant outbreaks had even occurred almost anywhere else in the world outside China. Thus, we have America assassinating Iran's top military commander on Jan. 2nd and then just a few weeks later large portions of the Iranian ruling elites became infected by a mysterious and deadly new virus, with many of them soon dying as a consequence. Could any rational individual possibly regard this as a mere coincidence?

## Addendum: The Hypothetical Scenario of the Covid-19 Outbreak:

Since various commenters have posed questions regarding my reconstruction of the Covid-19 outbreak, it’s probably best for me to provide a summary of my own theory, already included in a lengthy

comment a couple of weeks ago, but sufficiently important to be made part of the main text. Obviously, this reconstruction is quite speculative, but I think it best fits all the available evidence. Individual components can be changed or replaced without necessarily damaging the overall hypothesis.

(1) Rogue elements within our large national security apparatus probably affiliated with the Deep State Neocons decided to inflict severe damage upon the huge Chinese economy using biowarfare. The plan was to infect the key transport hub of Wuhan with Covid-19 so that the disease would invisibly spread throughout the entire country during the annual Lunar New Year travels, using the cover of the Wuhan International Military Games to slip a couple of operatives into the city to release the contagion. My guess is that only a relatively small number of individuals were involved in this plot.

(2) The biological agent they released was designed primarily as an anti-economy rather than an anti-personnel weapon. Although Covid-19 has rather low fatality rates, it is extremely contagious, has a long pre-symptomatic infectious period, and can even spread by asymptomatic carriers, making it ideally suited for that purpose. Thus, once it established itself throughout most of China, it would be extremely difficult to eradicate and the resulting efforts to control it would inflict enormous damage upon China's economy and society.

(3) As a secondary operation, they decided to target Iran's political elites, possibly deploying a somewhat more deadly variant of the virus. Since political elites generally tend to be elderly, they would anyway suffer far greater fatalities.

(4) The deadly SARS and MERS outbreaks in East Asia and the Near East had never significantly spread back to America (or Europe), so the plotters wrongly assumed that the same would be the case with Covid-19. Anyway, since international organizations always ranked the US and Europe as having the best and most effective public health systems for combating any disease epidemic, they believed that any possible blowback damage would be very minor.

(5) Only a small number of individuals were directly involved in this plot, and soon after the disease was successfully released in Wuhan, they decided to further safeguard America's own interests by alerting the appropriate units with the Defense Intelligence Agency, probably by fabricating some sort of supposed intelligence leak. Basically, they arranged for the DIA to hear that Wuhan was apparently suffering a cataclysmic disease outbreak, thereby leading the DIA

to prepare and distribute a secret report warning our own forces and allies to take appropriate precautions.

(6) Unfortunately for these plans, the Chinese government reacted with astonishing determination and effectiveness, and soon stamped out the disease. Meanwhile, the lackadaisical and incompetent American government largely ignored the problem, only reacting after the massive outbreak in Northern Italy had gotten their attention. Since the CDC had botched production of a testing kit, we had no means of recognizing that the disease was already spreading in our country, and the result was massive damage to America's economy and society. In effect, America suffered exactly the fate that had originally been intended for its Chinese rival.

(7) Again, this is my own hypothetical reconstruction, and people are free to dispute individual elements. But I think it best fits with the very limited amount of solid evidence. My long article from April fleshes out the China/America background in much greater detail.

# White Racialism in America, Then and Now

October 5, 2020 • 24,900 Words

One morning a couple of years ago I received an urgent email from a moderately prominent libertarian figure strongly focused on antiwar issues. He warned me that our publication had been branded a "White Supremacist website" by the *Washington Post*, and urged me to immediately respond, perhaps by demanding a formal retraction or even taking legal action lest we be destroyed by that totally unfair accusation.

When I looked into the matter, my own perspective was rather different. Apparently Max Boot, one of the more agitated Jewish Neocons, had written a column fiercely denouncing some recent criticism of pro-Israel policies that Philip Giraldi had published in our webzine, and the "White Supremacist" slur was merely his crude means of demonizing the author's views for those of his readers who might be less than wholeheartedly enthusiastic about Benjamin Netanyahu and his policies.

After pointing this out to my correspondent, I also noted that a good 10% or more of our writers were probably "White Nationalists," and perhaps a few of them might even arguably be labeled "White Supremacists." So although Boot's description of our website was certainly wrong, it was probably less wrong than the vast majority of his other writing, which was typically focused on American military policy and the Middle East.

Our webzine is quite unusual in its willingness to feature a smattering of writers who provide a White Nationalist perspective. Such individuals are almost totally excluded from other online publications, except for those marginalized websites devoted to their ideas, which often tend to focus on such topics and related issues to the near exclusion of anything else. However, I believe that maintaining this sort of ideological quarantine or "ghettoization" greatly diminishes the ability to understand many important aspects of our world.

Substituting ideological slurs and demonization for rational evaluation and rebuttal has long become a commonplace in heated American

policy debates, recently growing more severe in the wake of the Black Lives Matter movement and the associated "cancel-culture" driven by inflamed social media. Locating a couple of controversial sentences and then using these to dismiss an enormous body of detailed analysis may sometimes serve as an effective debating technique among timorous journalists, but its intellectual legitimacy seems rather doubtful. And this is especially true with regard to the charged subject of white racialism, which seems to provoke a near-religious antipathy among so many of the politically correct elites of our society, despite their avowedly secular protestations.

Even the choice of preferred accusatory phrases suggests a certain amount of bad faith. My impression is that a couple of years ago members of the pro-white ideological camp were usually denounced as "White Nationalists" but more recently that term has been superseded by "White Supremacists." I suspect that part of the reason for this verbal shift was the obvious hypocrisy of their disparate treatment. As I noted a few years ago:

> A strident Black Nationalist such as Malcolm X was widely condemned during his own lifetime as an extremist advocate of violence, yet he has now been honored with a U.S. postage stamp, while today a lifelong racial activist such as Al Sharpton has his own *MSNBC* cable television show and received 80-odd invitations to the White House over the last few years. Such treatment seems very different from what their white-activist counterparts, either past or present, might expect to receive.

Following the unexpected victory of Donald Trump and the resulting sudden media prominence of the racialist Alt-Right, a national journalist who had become a leading chronicler of that movement visited me for lunch in Palo Alto, and we spent a couple of hours discussing what I considered some of the tremendous ironies of America's existing ideological landscape. Among other things, I pointed out that the overwhelming majority of the world's leading academics and intellectuals from one hundred years ago—whether left, right, or center—held many views that would surely have gotten them branded as "White Nationalists" in today's severely constricted ideological climate.

But whereas today's WNs are an extremely vilified and marginalized group, with their ranks therefore necessarily skewed towards eccentrics and misfits, the situation was entirely different back then. Their counterparts of the past included many of the foremost academic scholars and public intellectuals of that era, who openly

discussed their views in leading opinion journals rather than by pseudonymous postings in dark corners of the Internet. Partly for this reason, such individuals tended to approach the same issues with far greater sophistication.

Until the early 2000s, nearly all these names would have been almost unknown to me, either rating a sentence or two in my introductory history textbooks, or else being entirely omitted. But I spent most of that decade building a content-archiving system that provided convenient access to over a million articles from more than 200 of our leading periodicals since the mid-nineteenth century, and was stunned by the severe distortions and enormous lacunae in my knowledge which this revealed. As I wrote a couple of years ago on related matters:

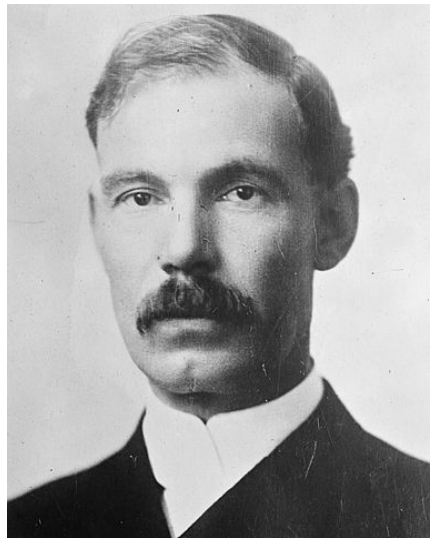
> I sometimes imagined myself a little like an earnest young Soviet researcher of the 1970s who began digging into the musty files of long-forgotten Kremlin archives and made some stunning discoveries. Trotsky was apparently not the notorious Nazi spy and traitor portrayed in all the textbooks, but instead had been the right-hand man of the sainted Lenin himself during the glorious days of the great Bolshevik Revolution, and for some years afterward had remained in the topmost ranks of the Party elite. And who were these other figures—Zinoviev, Kamenev, Bukharin, Rykov—who also spent those early years at the very top of the Communist hierarchy? In history courses, they had barely rated a few mentions, as minor Capitalist agents who were quickly unmasked and paid for their treachery with their lives. How could the great Lenin, father of the Revolution, have been such an idiot to have surrounded himself almost exclusively with traitors and spies?

As I gradually discovered, large portions of America's entire intellectual past had been hidden or altered beyond recognition, and racial beliefs constituted a major portion of this transformation.

The ongoing "cancel-culture" of today's elite-backed Black Lives Matter movement represents merely the latest iteration of this long process. The names of many of our most famous presidents and honored national leaders have recently been stripped from buildings and public monuments, and a committee organized by the Mayor of DC recently called for the possible removal of the Jefferson Memorial and the Washington Monument. If this current social revolution continues, we are only a step or two away from a society in which any favorable public mention for Thomas Jefferson or George Washington

might be regarded as an immediate firing-offense by many major corporations, and grounds for banning by social media. Although such a development seems unlikely, it would merely represent an extreme version of the ideological purge that has already reshaped our academic and journalistic world over the last century.

## The Sociology of E.A. Ross



In my conversation with that national journalist, one of the major examples I cited was that of E.A. Ross, a leading intellectual figure of the early decades of the twentieth century but now largely forgotten except when portrayed as a racist cartoon villain by ignorant present-day academics. Last year, I noted such crude treatment by Holocaust historian Joseph W. Bendersky in his book documenting and condemning the views of America's Anglo-Saxon elites from a century ago:

> Although I would not question the accuracy of Bendersky's exhaustive archival research, he seems considerably less sure-footed regarding American intellectual history and sometimes allows his personal sentiments to lead him into severe error. For example, his first chapter devotes a couple of pages to E.A. Ross, citing some of his unflattering descriptions of Jews and Jewish behavior, and suggesting he was a fanatic anti-Semite, who dreaded "the coming catastrophe of an America overrun by racially inferior people."

But Ross was actually one of our greatest early sociologists, and his 26 page discussion of Jewish immigrants published in 1913 was scrupulously fair-minded and even-handed, describing both positive and negative characteristics, following similar chapters on Irish, German, Scandinavian, Italian, and Slavic newcomers. And although Bendersky routinely denounces his own ideological villains as "Social Darwinists," the source he actually cites regarding Ross correctly identified the scholar as one of America's leading *critics* of Social Darwinism. Indeed, Ross's stature in left-wing circles was so great that he was selected as a member of the Dewey Commission, organized to independently adjudicate the angry conflicting accusations of Stalinists and Trotskyites. And in 1936, a Jewish leftist fulsomely praised Ross's long and distinguished scholarly career in the pages of *The New Masses*, the weekly periodical of the American Communist Party, only regretting that Ross had never been willing to embrace Marxism.

- The Old World in the New
  *The Significance of Past and Present Immigration to the American People*
  E.A. Ross • 1914 • 59,000 Words

Ross was quite plain-spoken in his views, and his long career was bracketed by his leading national role in major free speech issues. As a young academic, he had been fired by Stanford University for his political beliefs, a celebrated incident that led to the creation of the American Association of University Professors, while he ended his life serving for a decade as national chairman of the ACLU.

In 1915 Ross published *South of Panama*, describing the backwardness and misery he had encountered in so many of the societies of Latin America during his half year of travels and investigation across that region. Although the bulk of the text was descriptive and empirical, at one point he pondered the underlying nature of those problems, wondering whether the causes were primarily cultural, due to the widespread poverty and lack of education, or instead a result of the innate inferiority of the local population, emphasizing that the answer to this crucial question would have an enormous impact upon the continent's future developmental trajectory.

After even-handedly mentioning some of the limited evidence supporting each of these two conflicting theories, he ultimately leaned towards the environmental side, criticizing heredity as "a cheap offhand explanation" of human characteristics that actually often change over time. Today such a discussion would be utterly

unimaginable within the confines of our respectable academic or media worlds, and for opposite reasons would also be extremely rare among committed racialists.

- South of Panama
  E.A. Ross • 1917 • 71,000 Words

Although Ross was uncertain about the natural abilities of South America's mostly Mestizo population, a six month research trip to China a few years earlier had left him no doubt abut the potential of the Chinese, despite their immense existing poverty.  As he recounted in his book:

> To forty-three men who, as educators, missionaries and diplomats, have had good opportunity to learn the feel of the Chinese mind, I put the question, Do you find the intellectual capacity of the yellow race equal to that of the white race? All but five answered Yes, and one sinologue of varied experience as missionary, university president and legation adviser left me gasping with the statement, Most of us who have spent twenty-five years or more out here come to feel that the yellow race is the normal human type, while the white race is a sport.'

Given these conclusions, he felt quite confident of China's future success as I explained a few years ago:

> [China's global rise] would have seemed far less unexpected to our leading thinkers of 100 years ago, many of whom prophesied that the Middle Kingdom would eventually regain its ranking among the foremost nations of the world. This was certainly the expectation of E.A. Ross, one of America's greatest early sociologists, whose book *The Changing Chinese* looked past the destitution, misery, and corruption of the China of his day to a future modernized China perhaps on a technological par with America and the leading European nations. Ross's views were widely echoed by public intellectuals such as Lothrop Stoddard, who foresaw China's probable awakening from centuries of inward-looking slumber as a looming challenge to the worldwide hegemony long enjoyed by the various European-descended nations.

  E.A. Ross • 1911 • 61,000 Words

Ross published more than two dozen books and numerous articles, and I have no doubt that these could easily be mined for a multitude of sentences or paragraphs that would today ignite a firestorm of controversy on Twitter or among the talking-heads of Cable TV, with a lynch-mob branding him a "White Supremacist" fit for deplatforming. But that merely demonstrates the severe flaws in our current climate of harsh ideological censorship.

## Lothrop Stoddard and *The Rising Tide of Color*

*Lothro Stoddard*

A much stronger case could be made against his close contemporary Lothrop Stoddard, also mentioned above. Indeed, I doubt that Stoddard himself would have disputed any attempt to label him as a "White Supremacist." After all, his most famous and influential work bore the full title "The Rising Tide of Color Against White World-Supremacy," and that 1921 bestseller focused upon the emerging challenges that peoples of white European origin faced in maintaining their global control in the aftermath of the terribly destructive First World War.

But although that term would probably apply to Stoddard, the marginalizing implications it carries in today's society would be extremely misleading since his beliefs were so widely shared by much of America's political and intellectual elite. He himself came from a prestigious New England family, and after earning his doctorate in

history at Harvard, his series of very successful books quickly established him as one of our country's most influential writers and public intellectuals, winning him regular invitations to lecture at our nation's military academy and with his articles regularly gracing the pages of our most prestigious national publications.

The serious concerns he raised about the economic challenge America and Europe might soon face from a rising China were grounded in solid realism. For example, he approvingly quoted the late Victorian predictions of Prof. Charles E. Pearson:

> Does any one doubt that the day is at hand when China will have cheap fuel from her coal-mines, cheap transport by railways and steamers, and will have founded technical schools to develop her industries? Whenever that day comes, she may wrest the control of the world's markets, especially throughout Asia, from England and Germany.

Many of Stoddard's books focused upon sharp racialist issues, and these might seem extremely jarring to a modern readership. But other works fell outside that area, and they effectively demonstrated the remarkable quality and objectivity of one of America's leading geopolitical thinkers of that era.

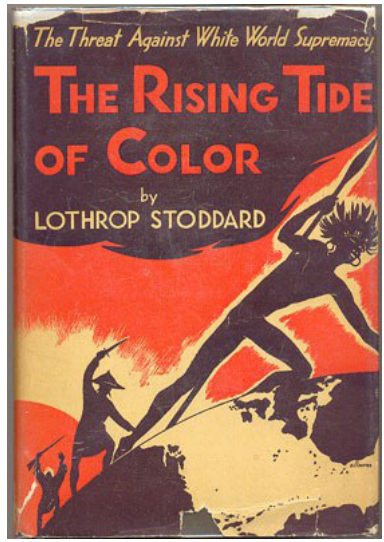
For example, just prior to our own 1917 entry into the First World War, he had published *Present-Day Europe*, providing a detailed description of the political and social situation in all of the contending European states, including their historical roots. I happened to read the book about a decade ago, and found it the best summary treatment of that subject I had ever encountered.

- Present-Day Europe
  *Its National States of Mind*
  Lothrop Stoddard • 1917 • 74,000 Words

World War I and its immediate aftermath saw the collapse of the Ottoman Empire, the abolition of the Islamic Caliphate by Ataturk's secular regime, and the widespread rise of left-wing militant atheism inspired by the Bolshevik Revolution. As a natural consequence, nearly all Western thinkers dismissed the power of Islam as a spent force and a fading relic of the past, while Stoddard was almost alone in presciently suggesting its possible worldwide revival in *The New World of Islam,* published in 1922.

- The New World of Islam

Lothrop Stoddard • 1922 • 95,000 Words



But Stoddard's best-known work certainly remains *The Rising Tide of Color*, published 100 years ago, which launched his influential career. About a decade ago, I finally got around to reading it, and was greatly surprised that a book so heavily demonized in every description I had encountered actually came across as so level-headed and innocuous. Although most of the leading political figures of that time proclaimed permanent white rule of the world, Stoddard strongly argued that this situation was temporary, soon to evaporate under the pressure of rising non-white nationalism, economic development, and population growth. These rising tides of the peoples of Asia and the Middle East made their eventual independence almost inevitable, and the European powers should therefore voluntarily relinquish their vast colonial empires rather than earn future bitterness by stubbornly seeking to retain them. A "White Supremacist" might certainly advance such arguments, but only one of far greater sophistication than is today implied by that popular media slur.

BRZEZINSKI

I recently reread Stoddard's volume and was even more impressed the second time through. In many respects, his sweeping panorama of the future geopolitical landscape brings to mind *The Clash of Civilizations*, published in 1997 by renowned Harvard political scientist Samuel P. Huntington, which then became a huge national bestseller and cultural-touchstone in the wake of the 9/11 attacks of 2001. Yet although Huntington's text is just two decades old and Stoddard's has reached its first century, I think it is the former that actually now seems much more dated and less applicable to the current alignment of the world and the challenges faced by white European populations.

- The Rising Tide of Color Against White World-Supremacy
  Lothrop Stoddard • 1920 • 78,000 Words

By the mid-1930s, Stoddard's star was fading, with his racialist framework under growing pressure both in the sciences and by the influential leftist and anti-racist elements brought into power during the New Deal Era. His last book appeared the year before our entrance into the Second World War and probably sealed his intellectual fate. As I wrote last year:

> During late 1939, a leading American news syndicate sent Stoddard to spend a few months in wartime Germany and provide his perspective, with his numerous dispatches appearing in *The New York Times* and other top newspapers. Upon his return, he published a 1940 book summarizing all his information, seemingly just as even-handed as his earlier 1917 volume. His coverage probably constitutes one of the most objective and comprehensive American accounts of the mundane domestic

nature of National Socialist Germany, and thus may seem rather shocking to modern readers steeped in eighty years of increasingly unrealistic Hollywood propaganda.
